In the course of the above discussion some allusion was made to earthquakes, Dr. Gibbons remarking that we had enjoyed an unusually long immunity from earthquakes of any magnitude. The great earthquake of last October he thought to have been a very critical one. It had given vent to the accumulated gases, and hence we had since felt no shakes of consequence, but he should not be surprised, *after it was over*, if we had a small shake one of these days. He did not wish to alarm the members of the Society, but he thought we might look for an earthquake almost any day.

At the close of the discussion on the main subject the Academy adjourned.

Notices to Correspondents.

Taxidermist.—Naturalists, unless in exceptional cases, do not preserve animals, birds, etc., further than by impregnating the skins and plumage desired to be maintained in their original appearance with some powerful antiseptic, which is ohnoxious both to insects and animalculæ. Arseniate of potash is consequently used for this purpose. In this condition they are arranged in boxes or drawers, instead of being stuffed and placed in cases. The boxes and drawers are respectively devoted to a family, genus, or section. Thus preserved and thus arranged, as perfect and as useful a collection as a youthful student will need or probably desire, will occupy a comparatively small space. Freedom from exposure to light and dust are essential to the preservation of colors; and, consequently, closed drawers are much better calculated for maintaining the appearance of specimens—especially brilliant ones—than if placed in glass cases.

J. M., Mariposa.—Dr. Zirkel submitted all the varieties of quartz entering into the composition of granites, porphyries, and trachytes, to microscopic examination, and according to his statement, found all to possess innumerable cavities containing liquids; some of which cavities were so small that even under a magnifying power of 2,000, they appeared only as minute points. The quartz and associated feldspar included particles of matter which had taken the shape of vitreous or lithoid cavities or pores. In nearly all the varieties of granite, the quartz is described as including myriads of crystals of vitreous feldspar, irregularly spread in every direction.

J. W. B., Grass Valley.—From the observations made on *a* Centauri at the Cape of Good Hope, former calculations were confirmed respecting its parallax, which was found to exceed nine-tenths of a second; hence its distance from the earth must amount to at least twenty billions of miles. So far as human agency has been able to ascertain up to the present time, the star in question is the nearest one to us of the stellar system.

A Communication from "J. T.," of Gibsonville, with regard to the source of the ancient rivers of California, and the occurrence of coal on the Middle Fork of Feather River, will appear next week.

New Blow-pipe Apparatus.—We would call attention to a communication in another column descriptive of a new blow-pipe apparatus, which may prove of great advantage to prospectors, as well as to all others who have much assaying to do. A patent for this invention has just been secured through the Mining and Scientific Press Patent Agency.

What is the "Practical Use" of the Spectroscope?

First, what *is* the spectroscope? Briefly, it consists of a glass prism and a small telescope. How is it used? A few words will explain.

If we admit a ray of light into a dark room, through a narrow slit in the window shutter, it appears on the opposite wall as a white spot, shaped like the slit. If we hold in its track a glass prism, it appears on the wall as a strip of light made up of various colors arranged in a certain order; the differently colored rays, of which the ray of white light is made up, being differently bent by the prism. This strip, or band, is called the spectrum. The order in which these colors are arranged is invariable. Now different substances when vaporized and made luminous, give different colors; each its own kind of light. If we should admit through the slit, instead of sunlight, the light given off from burning sodium, for instance, we should see nothing on the opposite wall but a bright yellow line, exactly in the place which the yellow occupied in the spectrum produced by the sunlight,—that is, in the *continuous*, or solar, spectrum. Common salt, which is chloride of sodium, will answer for this experiment. A platinum wire, dipped in a solution of it, and held in the flame of an alcohol lamp, which is itself colorless, will give the yellow line which constitutes the spectrum of sodium. The same is true of other simple substances; each gives, under proper conditions, its own spectrum. Hence we have an infallible means of detecting the presence, in any luminous vapor, of any substance whose spectrum has been already determined. The very smallest quantity of the substance is sufficient.

Instead of admitting the ray through a chink in the window shutter of a room, we may, of course, allow it to reach the eye directly through a telescope. This is what we do, when we use the *spectroscope*. The rays from the incandescent source of light, whatever it may be, pass through a tube and strike a prism, on the opposite side of which, at the proper angle, they enter a small telescope to which the eye is applied in the usual manner. The tube aforesaid has, at its end furthest from the prism, a slit through which the rays are admitted; and at its other end, a lens which serves to parallelize them. In front of this slit is placed the substance to be examined. If it is not vaporizable in the flame of a Bunsen's burner, or in the oxyhydrogen flame, the intense heat of the electric discharge is employed for the purpose; the substance being made to form terminal points, between which the spark leaps when the observer completes the circuit by bringing two wires in contact with each other. At that instant an infinitesimal portion of the substance is volatilized and made luminous; and the observer notes the lines of its spectrum and their exact position. This is done by means of a transparent glass scale showing the position of all the lines upon the solar spectrum, which scale is so placed at the end of another tube belonging to the instrument, that its image falls upon the telescope side of the prism, and is thrown by it into the eye at a point just above the spectrum under examination,—which is thus easily compared with it. Here then we have the spectroscope in its simplest form. Various modifications of this form are in use. Some are made with several prisms, so arranged with reference to each other that the rays traverse the whole; others have a small prism in front of one-half the slit, by means of which the light from another substance may be thrown into the tube and examined at the same time with the first, for the sake of accurate comparison. But the essentials of the instrument, as we intimated at the outset, are a prism and a telescope.

Now for its "practical" use. As we have said, the minutest conceivable quantity of a substance unerringly betrays itself to this exquisitely delicate test. With this instrument we can detect the two hundred millionth of a grain of salt floating in the air; we can see that substance a million miles off. With this instrument we can determine the constitution of the sun; with it we can analyze the stars. The presence of iron, copper, nickel, cobalt, magnesium, hydrogen, sodium, calcium, and barium,—in the luminous envelope of the sun,—has by its aid been fully ascertained. Who knows what light the knowledge of these facts, and of those yet to be discovered by the same means, will shed upon astronomical science? But this is not all. The instrument has claims to notice which will appear stronger than this, to many whose notions of "practical" value are based immediately upon the pocket. With this instrument the iron-master can tell the precise moment when the particular kind of steel which he wishes to produce has taken up the desired proportion of carbon. The flame itself tells the story far more perfectly than any rule of thumb at the critical moment, or even than subsequent analysis of the resulting product.

By this means, too, the dyer may ascertain the purity of his materials, more accurately than by any elaborate and time-taking analyses; and that perhaps at a moment when thousands of dollars may be depending on exactness,—when prepared vats of expensive dyestuff may be ruined by the addition of an impure article. By means of this instrument, too, the murderer may be brought to justice; and the damning blood-spot which has been fading for twenty years, be made to yield up its secret. Spectral analysis has infallibly distinguished between stains of this character and others so closely resembling them that it would be impossible to decide the question by any other means. With this instrument new metals may be discovered: with it,—says Prof. Barker,—"the green line of thallium first saw the light." Indium was discovered by the same means. Indeed the field for research which this little instrument has opened to the scientist is immense; and its "practical" value incalculable. The tenth year since its discovery is not yet completed. Who can guess its future?

Death of Louis Prevost.

A dispatch from San José on the 16th announced the death of Louis Prevost. It is an especially notable death. The State suffers a loss in it. Mr. Prevost deserved well of California. He had devoted himself to the advancement of the silk culture; an industry which is probably destined to be one of the most important on this coast. For the last thirteen years, Mr. P. has been active in urging the peculiar fitness of California for the business; and for the last three or four has himself been entirely occupied in it. He has kept up an extensive correspondence with European silk-growers and silk manufacturers; and was always ready to communicate information on the subject. Having become convinced that Los Angeles County offered especial advantages for this culture, he went thither early in the present season to establish an extensive cocooncry; and undoubtedly owes his death to the exhaustion consequent upon his unceasing labors during the summer. He felt a laudable pride in being known as the "Pioneer Silk Culturist"; and his fame as such will be lasting. He was sixty-three years of age.

Contributions to Our Cabinet.—A correspondent, "T. F.," sends us some samples of agate, such as are often picked up along the line of the Pacific Railroad. They may be found in great numbers at and near the summit of the South Pass. They are of the ordinary variety, and need no special description.

A New Mineral—Durangite.

Some months since Mr. Jos. Bennett left at this office, for examination, a mineral which he had obtained from the vicinity of the stream-tin deposit of Durango, Mexico. We made a brief mention of its reception, and handed the specimen to Mr. Henry G. Hanks, of the firm of Falkenau & Hanks, chemists, of this city, for further examination. Mr. H. finding the mineral quite new and interesting in character, forwarded a portion of the same to Prof. Geo. J. Brush, of the Sheffield Scientific School, of Yale College, for more particular examination and analysis. Mr. H. has just received a letter from the Professor, accompanied by a proof-sheet impression of an article which he has prepared for the September number of the *American Journal of Science*, from which it appears that the Durango specimen is a new and most interesting mineral, which the Professor has named—after the locality where it was found—Durangite.

The mineral is of a bright orange red, the crystals having a rhombic aspect; streak, cream yellow; luster, vitreous; cleavage, distinct in two directions; crystallization, monoclinic; hardness, 5; specific gravity, 3.95—4.03. The small quantity of mineral which could be used for the test, did not allow a full and complete quantitative determination. Direct duplicate estimations, however, were obtained of every constituent except fluorine. This last element was found to exist in such considerable quantity, that the fluohydric acid evolved, in attacking the mineral by sulphuric acid, etched the glass with great readiness and distinctness. The following results were obtained by analysis. No. 1 in the wet way, by sulphuric acid:

Arsenic acid	55.10;	Quantity of oxygen		19.16
Alumina	20.60;	"	"	9.63
Ferric oxide	4.78;	"	"	1.44
Manganous oxide	1.30;	"	"	0.30
Soda	11.66;	"	"	3.01
Lithia	0.81;	"	"	0.43
Fluorine	undetermined.			
	94.33			

Analysis No. 2, made in the dry way, by fusion with carbonate of soda; dissolved in water, acidulated with chlorhydric acid, gave: Arsenic acid, 53.22; alumina, 20.09; ferric oxide, 5.06; manganous oxide, 1.28. The low amount of arsenic acid by this determination, it was thought, might be due to the fact that the soda fusion was made over a gas blast-lamp, with the possibility that a portion of arsenic acid might have been reduced to arsenious acid, and volatilized; or possibly to other accidental causes. The small quantity of mineral at hand would not allow of a repetition of this analysis.

An analysis, No. 3, was made, qualitative-quantitative, in which only the alkalies were estimated. The result of this was: Soda, 11.86; lithia, 0.70—agreeing very closely with No. 1. The alkalies examined with the spectroscope showed only the lines of sodium and lithium.

The composition and oxygen ratio (nearly 1 : 3 : 5), says the Professor, "suggest an *analogy* between the new mineral and amblygonite, a fluo-phosphate of alumina, lithia and soda;" but he thinks the results given are sufficient to demonstrate it to be a new mineral, and, as he thinks, the only observed native fluo-arseniate.

The Professor, in his private note, says: "It is one of the most interesting minerals, chemically speaking, that I have ever investigated; and I have enjoyed the study of it exceedingly."

Mr. Hanks has sent, through the Mexican Consul, for a considerable quantity of the mineral, which he hopes soon to receive, and a portion of which he will forward to Professor B. for further examination.

The study of the crystallography of the mineral has been taken up by Prof. John Blake, who will give a preliminary note on his observations in the September number of the *Journal of Science*, which will soon be received in this city, and to which we would refer the reader for the entire article from which we have taken the liberty to collate the above.

The Stevens' Flux.

Quite a little excitement was created in the Eastern States, some two years ago, with regard to a new flux which it was proposed to introduce as an agent in the smelting of minerals and for other metallurgical purposes. Such extravagant claims were set up for it, however, by some of its more injudicious friends, that they no doubt operated to its injury for the time. But as no question was raised as to its excellency as a flux, those who were well posted in metallurgical operations have kept it constantly in view, and have become much interested in the various experiments which have been made with it from time to time, particularly as a substitute for borax in welding iron and steel, and for its use as a flux in foundry cupolas.

Within a few days a small quantity of the material has been received in this city, consigned to Mr. S. W. Bugbey, 406 Montgomery street. Small lots of the same have been distributed among the various foundries, which have been experimenting with it during the past week, and so far as we have learned, with most satisfactory results. It is claimed, and apparently with just reason, that by using a few pounds of this flux in the cupola, the iron is melted easier, flows more rapidly, and leaves the furnace cleaner. It appears to operate as a glazing for the ladles, causing the iron to run off more freely. Its action also appears to cause the impurities to rise more freely from the molten mass, thereby securing a cleaner and more perfect casting. It is also said to cause the iron to retain its "life" longer—to continue longer in a fluid state. We have seen some very strong testimonials of its value, for the purposes mentioned, from the proprietors of the Golden State Foundry. This flux is prepared with a greater or less degree of care, upon which depends its price—the cheaper quality being used as above, and the finer as a substitute for borax for welding iron and steel. It is much cheaper than borax, and said to be quite as good for welding. It is made from the residuo of kryolite, after that mineral has been employed in the manufacture of soda.

The Sierra Iron Company.—This is the first systematic attempt to work an iron mine in California. The company intend to work iron and coal mines, acquire water privileges, timber lands and real estate, and to manufacture iron. It will operate in Gold and Mohawk Valleys in Sierra and Plumas counties. The iron deposits are reported by F. E. Brown, C. E., who was employed by the company to examine them, as valuable, accessible, and easily worked. Baron Richthofen, who explored these iron fields in 1865, says they can boast of the best quality of iron ore known to exist.

Death of O. P. Truesdell.—The funeral of Orrin P. Truesdell takes place to-day, at Oakland. Mr. Truesdell was late proprietor of the Oakland *Transcript*. He resided many years in this city, and held offices of responsibility in the Typographical Association. He was a thorough master of the printer's art; and was at one time connected in the job printing business with the proprietors of this journal.

Passenger Traffic.—The arrivals at San Francisco by sea for July, 1869, were 3,013, exceeding those of July, 1867, by 289. It is thought, however, that the departures by the overland railroad were something in excess of the arrivals; which would probably reduce the total increase of emigrants for the month to about the figure of July last year.

Fighting Locusts.—The Pacha of Cyprus has recently conducted a campaign against the locusts, which have sorely infested that island. Nearly three thousand men were employed thirty days. The insects were caught in nets, and destroyed by burial in the earth.

Mechanics' Institute Exhibition.

The approaching exhibition of the Mechanics' Institute is beginning to engross much attention. Space in the pavilion is fast being taken up—fully three-quarters has already been taken. Applications for room are coming in from most unexpected sources. Already articles for exhibition have been received from New York, Chicago, Salt Lake, New Orleans, and the Sandwich Islands. Exhibits are expected from South America, Mexico, China and Japan. It is time that all our local exhibitors were making preparations for their display; some are already doing so. It is desired to make the coming exhibition more strictly than any preceding one, a display of the actual industries of the various localities on the Pacific Coast, its islands and opposite shores, as well as our great interior, west of the Rocky Mountains.

Notwithstanding the dullness among the foundries and machine shops, it is confidently expected that there will be a greater display of steam engines, and all kinds of heavy machinery, than has ever yet been witnessed in this city. The mineral display is also expected to form quite a feature. The Art Gallery is fast filling up with the rarest works of our home artists. An important change will be made in this portion of the exhibition the present season. The Art Gallery, as occupied last year, was a single room 204 feet long by 30 wide. At the coming exhibition it will be divided into three rooms—one, on the south end, 80x30, the other two being 62x30 each.

The larger room will be occupied exclusively by oil paintings, and will be elegantly fitted up, carpeted etc. The middle room will be devoted to statuary and marble work; while the north room will be devoted exclusively to photographic displays. Parties intending to exhibit should bear in mind that all applications for room must be made on or before the 28th instant. The managers are especially desirous that all articles should be presented at as early a day as possible. Exhibitors will do well to remember the confusion and loss of time attending a delay in getting their exhibits ready and in place, beyond the day fixed for opening. It should be recollected that a vast amount of labor must be expended in arranging the great number of articles that will be presented for filling up so large an edifice. The crowding of an undue portion of this work into an unnecessarily small number of "last days," is attended with great inconvenience to both the managers and exhibitors. It is to be hoped that a manifest improvement in this particular may be seen over what has heretofore been noticed. A distinctive feature in the coming exhibition will be the setting apart of the galleries for booths and bazaars. Everything indicates that the coming exhibition will surpass all former efforts of a like character on the Pacific Coast.

Mr. Roebling—His Will—His Successor.—The late John A. Roebling, the successful engineer, whose last great work, the suspension bridge over the East River, yet remains to be completed, left a million and a half of property. In his will, just opened, he bequeaths $100,000 to each of his children, and divers sums to charitable associations. Mr. Washington A. Roebling, his son, has been appointed his successor as engineer of the East River Bridge.

Rail-car Work in Massachusetts.—At the Boston and Albany Railroad shops, workmen are engaged in making solid iron trucks, which are substituted for the old wooden ones. A year's trial has proved the vast superiority of the iron work. The frames of these trucks are made of solid iron three by one and a quarter inches. About 700 have already been finished, at a cost of $479 per set.

Vallejo.—The seventh ship is now loading with grain at Vallejo. The enterprise, having for its object the making of that place a point of grain shipment for the region between there and Marysville, if not for all the country to the north of the last named place, has proven a complete success. From present appearances it is probable that Vallejo will handle perhaps one-quarter of the wheat export of California. She will do even more than that, unless some steps are speedily taken to reduce the expenses of shipping from this port. The loss of business, even the present season, will be sensibly felt by the shippers, wharf owners, teamsters, and in fact all others in this city. This transfer of business *may* be increased by the addition thereto of the grain yield of Tulare and San Joaquin, which will not pass the port of Vallejo at an unnecessary cost to buyers and producers. Whatever tends to reduce the cost of handling our grain crops is a positive benefit to the State at large, however it may affect special localities.

A Delegation for the Fair.—Mr. Herrick, who recently went East in the interest of the Mechanics' Institute Exhibition, appears to be meeting with most excellent success, in calling the attention of our Western friends to the forthcoming Exhibition. Besides the interest already announced as being taken in Chicago, we learn from Mr. Hallidie, the President of the Institute, that the Elgin Watch Company, of Illinois, will send out a fine exhibit of their watches, together with a portion of the machinery, which will be kept in operation during the Fair. A company of some sixty or seventy ladies and gentlemen from Chicago, St. Louis and Cincinnati, has been made up to visit California and her Industrial Exhibition. They will accompany Mr. Herrick on his return. Three Pullman cars have been engaged for the accommodation of the party.

Atmospheric Phenomena.—The citizens of California have been treated during the past few days to some very singular atmospheric phenomena. The Academy of Sciences, at their meeting on Monday evening, as reported in another column, alluded to a peculiar condition of the atmosphere, generally, throughout this portion of the State, which doubtless has more or less influence in producing the special and more local phenomena which were witnessed on Tuesday and Wednesday evenings following. The crimson light was so bright in Sacramento as to cause an alarm of fire. The light was seen mostly in the northwest, and much resembled an auroral display, as it appears when seen through a very thin mist. The light was of a warmer hue than the aurora, and unlike that, perfectly steady and continuous in its glow, until it gradually faded out. It was no doubt due to a reflection of the rays of the sun below the horizon from or through some cloud at a high elevation.

A Puzzle for the Scientists.—It is said that recent researches among the fauna of the Northumberland coal measures in England have brought to light the remains of many fishes and a few reptiles, and the jaw of an animal belonging to the highest vertebrate class. The jaw has been seen by many men skilled in comparative anatomy, and they unanimously agree that the form is unmistakably mammalian. That "mammalian" must have been "born before his time," or the scientists have placed him quite out of his proper position in geological succession.

A Chispa such as you *Don't* Read of. A Downieville telegram dated 19th, is as follows: "The Monumental Quartz Company, at the Sierra Buttes, took out over $40,000 yesterday in once piece of gold, nearly pure, weighing one hundred and six pounds. It is a new claim, just being opened.

Work at the Foundries.

In continuing our notes from last week, we come to the

Fulton Foundry,

Which is working full handed and receiving an average share of business. The machinery for a new saw mill, now being erected in Mendocino County, by Messrs. Hayward & Harmon, is just being finished at this foundry. A quartz mill engine is also ready for shipment to White Pine, to be put up on a mine owned by some San Francisco capitalists. This engine has a 14-inch cylinder with 24-inch stroke. Two engines have also just been completed for Bay View, one 12 by 24, the other 8 by 16. An order for 200 hydrants, for the city, is also nearly completed—this large number being needed for the numerous street extensions which have been made the past season. We also noticed a large amount of general job and repair work in every stage of progress.

The Vulcan Foundry

Is now giving employment to a great number of men. This establishment has just turned out a large lot of superior machinery for the new California Sugar Refinery, located on Brannan Street, near Mission Creek. This machinery will be more fully alluded to next week. They are manufacturing large numbers of the new Hepburn pan at this foundry; also hydraulic power for the Shot Tower, and car axles and wheels. A huge iron cylinder, 80 feet long and five feet diameter, has also recently been built at this foundry for the Wood Preserving Company on King street. A tank 24 feet long by 12 wide and 12 deep, has also been constructed for the same company. The Mint roll gauge machine—the only one of the kind on the Pacific Coast—belonging to the San Francisco Mint, is kept in order at these works.

The Pacific

Has just received an order for a 10-stamp mill from Colorado. We believe this is the first order for mining machinery which has been sent to California from that Territory. The fact of the transmission of this order, and the recent reception in this city, of several letters from mining men in Colorado, show that the superiority of California machinery and California processes are beginning to be appreciated and sought after in Colorado.

This foundry has also just turned out a set of amalgamating machinery for White Pine, which is to be put up in connection with stamps, etc., which have been sent over from an old mill in Grass Valley. They have a large number of hands employed upon the iron work for Friedlander's building, now in process of erection, at the corner of California and Sansome streets. This structure calls for the largest amount of iron which has gone into any building which has yet been put up on the Pacific Coast—300 tons. In addition to the above, this foundry is doing its usual amount of repairing refitting, etc. The foundry department here is quite full of work; but, as is the case with all the other establishments of the kind, at the present time business in the machine is dull.

The Risdon Iron Works Co.

Have just completed the fourth propeller, which they have turned out since the company was organized, and have the fifth now in hand. The one just completed made her trial trip on Monday, and gave the fullest satisfaction to all parties concerned. The machinery which they now have in hand, is for a ferry boat, which is being built by the City Front Company; it will be 150 feet in length, with a powerful engine. A fair amount of jobbing is also being done at these works.

The Golden State

Is manufacturing a large lot of patent tanks for the quicksilver works at Knoxville, Lake County. They are also engaged, as usual, in general jobbing, and doing a fair share of other machine and foundry work.

Two-foot Gauge.—The Festiniog is a funny little two-feet gauge railway in Wales. It has been working five years. The traffic last year amounted to 130,000 tons and 145,000 passengers. Mr. Fairlie builds engines which have enabled the train loads to be doubled without much increasing the cost. The line for eleven miles has continuous ascent of sixty-six feet to the mile, with frequent curves, some of which are as small as one hundred feet radius. Mr. Fairlie's engine, the "Little Wonder," weighing 19½ tons, when fully equipped with fuel and water for the road, hauls after it 140 tons at a speed of fifteen miles an hour for the whole eleven miles. The engine has eight wheels, in two groups of four each, each group being acted on by a pair of cylinders eight and one-fourth inches diameter. The wheels of each group are two feet four inches in diameter, coupled together. The extreme wheel base is eighteen feet; consequently the engine runs with remarkable smoothness. At the same time the wheel base of each bogie being but five feet, the engine passes round curves of fifty feet with the utmost safety at twenty miles an hour.—*New York Stockholder.*

Acetate of Lead in Wine.—It is said that leaden shot are sometimes placed in the bottles when the wine to be put in them is a little "pricked"; in order that the resulting acetate (or sugar) of lead may correct the acidity. The *Druggists' Circular* has the following recipe for the detection of this poisonous adulteration: "Take of protosulphuret of calcium (made by fusing together in a crucible equal parts of quicklime and resublimed sulphur) and tartaric acid, of each two drachms; mix and pulverize finely; place them in a bottle with a pint of water, shake well, and let stand until the residue has fully settled, then filter or decant, and add to the clear solution one and a half ounces of tartaric acid. When this test is applied to wines containing even the least quantity of a salt of lead in solution, a black precipitate of lead will be thrown down, which is readily detected by the most inexperienced eye."

A Successful Career.—In the early rush to California, a poor boy named Charles Crocker, crossed the Missouri with an ox-team at Omaha, on his toilsome overland journey to the new gold regions. Nineteen years afterward—to a day—he arrived at Omaha on his return visit to his Eastern home. He came accompanied by his family, in his own special car, for he is now Superintendent of the Central Pacific Railroad, and every mile of it has been built under his supervision. He may well feel an honorable pride in the great work with which he has been so closely identified. His party were four days from Sacramento to Omaha; and on arriving there delighted the citizens with blooming flowers, and feasted them upon berries, oranges and luscious cherries from California, brought upon Alaska ice, 1,800 miles, through the green valley of the Pacific slope, and through the lingering snow drifts of the Rocky Mountains. It seems like a story from the Arabian Nights.—*Eastern Exchange.*

Mining Secretary.
THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.
Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

Mining Property for Sale.
A Two Thirds Interest
OF THE
Golden Rule Mining Company's
Claims and Mill,
Situated in Tuolumne County, California, two and a half miles south of Jamestown, on the Great Mother Quartz Lode. A good 15-stamp Water Power Quartz Mill is situated on the property, with a never-failing supply of water, as can be shown by the last four years continual running. This Claim has three parallel Ledges, from 50 to 100 feet apart, averaging from two to six feet in width, with a length of six hundred feet. They are so situated that a tunnel has been run through them at right angles, making a surface drainage of from seventy to eighty feet in depth on the mine. The mine is well ventilated by shafts from the surface, and well timbered so far as worked. In the mine are steam Hoisting Works, capable of hoisting from a depth of 300 feet. A force of thirteen men only are required to keep both mill and mine running regularly.
On the surface and flats for a distance of 500 feet from these veins, the ground or surface was mined by placer miners, in former years, producing from two to five ounces per day to the man, during the season when water could be obtained, which fact goes to prove that a heavy deposit of ore was once contained in the croppings of these shutes, which, by all former and present theories of deep mine workings, came from below, indicating that when sunk upon to a proper depth, the lead will develop a mine equal to the Amador or Eureka.
This claim has paid its 19th regular dividend of $1,500 each, during the past four years, besides all the construction and other expense account, and has levied no assessments during the same time, and at present has on hand $8,000 in the Treasury, and no debts.
The last level, 150 feet from the surface rock, averaged $7 per ton on which was a profit of from $1 to $1 50 per ton. The length of the two shutes of ore on the east vein, and the only one worked upon, has been about 200 feet.
Now I propose to sell two thirds of this valuable property for $16,000, cash; and any party who desires to purchase a property of this kind—which theory has proven that requires depth, on well known shutes of ore, for a sure fortune—can obtain a chance here, providing he or they will go down a sufficient depth. No purchaser is solicited unless he first goes and examine the mine, or sends a mining engineer in whom he can have confidence, to indorse what he may think proper of what has been here stated.
For any further particulars, direct by letter to Wm Bosworth, San Francisco, P. O. Box 1978, or at my office, room No. 5, over Donohoe & Kelly's Bank.

Ayer's

Hair Vigor,

For restoring Gray Hair to its natural Vitality and Color.

A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a

HAIR DRESSING,

nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long on the hair, giving it a rich glossy lustre and a grateful perfume.

Prepared by Dr. J. C. Ayer & Co.,

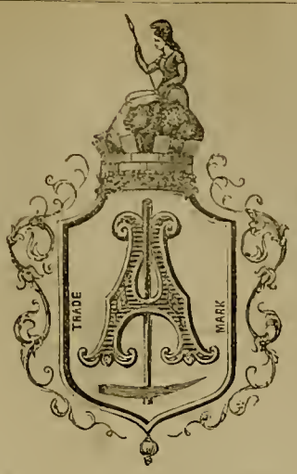
TRADE MARK.



New Almaden Vichy Water,

(CALIFORNIA VICHY WATER,)

FROM THE SPRINGS,

NEW ALMADEN,

Santa Clara County.

F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.

OFFICE, 506 JACKSON STREET,

GENERAL DEPOT:

Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the velinous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever:* Dyspepsia in all its s ages; Loss of Appetite; Bad Digestion; Flatulency; Co stani and Tenacious Vomiting; Weakness of certain Organs; the indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever;* Gout, *when the patient is still able to walk;* Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece

Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v18tf

That will resist the extremes of heat and cold without liquefying or hardening.

It is therefore peculiarly adapted to the varied climate of this coast, especially localities where THE WEATHER BECOMES EXCESSIVELY HOT, causing oil and all other kinds of grease to run from the axle, reaching the proper position. It remains soft until exhausted, leaving no deposit of GUM, TAR OR PITCH. Its superior lubricating properties, durability and cheapness have been tried and approved by the CENTRAL PACIFIC AND OTHER RAILROADS, STAGE PROPRIETORS, STABLE KEEPERS, TEAMSTERS, CONTRACTORS, MILLMEN, FARMERS, and many others who prefer to

USE NONE BUT THE BEST.

It being prepared by a peculiar CHEMICAL COMBINATION OF OIL, previously freed from gum or other deleterious substances, it must be obvious that by its use friction will be reduced to the lowest point. We feel assured that all desiring A NO. 1 LUBRICATOR will give this the preference over any other Grease IN THE MARKET.

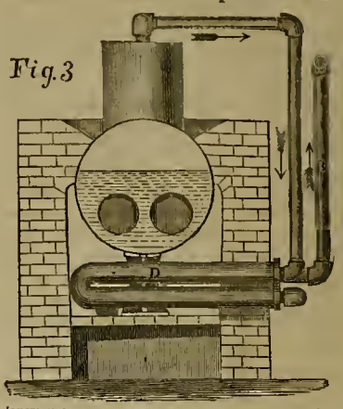
Sold by the Trade generally, and at the Factory, 100 Commercial street, San Francisco.
24v18-3m PETTIT & CO.

Important to every one using Steam for any purpose.

CARVALHO'S

Patent Steam Superheater

Fig. 3



[SECTIONAL END VIEW OF BOILER, WITH SUPERHEATER.]

Saves Fuel! Saves Water! Saves Pressure!

Brief Extracts from letters from parties using Carvalho's Superheater. Full letters can be seen on application:

NAVY YARD, Washington, June 15, 1869.
"Superheater saves 12 per cent. in fuel and 10 per cent. more in speed of engine."

NAVY YARD, Washington, Oct. 8, 1867 (after *seven* years of service.)
"Superheater yet attached to boilers, and appears to be in good order."

HOWARD WATCH AND CLOCK CO., Boston, May 19, 1866.
"Superheater saves us at least 10 per cent. in fuel and gives a large increase of power."

JONES & SMITH, New York, March 21, 1867.
"Superheater saves 20 per cent. of coal, less steam pressure, exhaust more serviceable in drying paper"

STEAM ENGINE WORKS, South Brooklyn, April 23, 1867.
"Superheater saves not less than 20 per cent. fuel; no priming!"

CRUCKETT LEATHER CLOTH CO., Newark, N. J., Oct 16, '67.
"Superheater economizes 25 per cent fuel; does our work with 25 lbs. less pressure steam, and steam superior for drying purposes."

N. Y DYEING & PRINTING ESTAB., Oct 4, 1867.
"Superheater brings contents of our dye vats to boiling point in one-third less time and one-third less increase of water; saves us at least 15 per cent. fuel."

CONTINUOUS OIL REFINING CO., Binghampton, N. Y., Sept. 20, 1867.
"Superheaters give entire satisfaction, and we superheat to 55 deg—an increase of 20 deg."

CAREW MANUF. Co., So. Hadley Falls, Mass., Oct. 17, '67.
"Superheater saves 15 or 20 per cent. fuel; steam for paper mill now perfectly pure and dry—an important advantage in our business."

STATEN ISLAND FANCY DYEING ESTAB., June 18, 1867.
"Superheater saves at least 25 per cent in fuel, and we have the advantage (hardly to be over-estimated) of perfectly dry steam."

ETNA IRON WORKS, San Francisco, Sept. 15, 1867.
"Superheater saves 25 to 30 per cent. in fuel; no priming"

CONTRA COSTA LAUNDRY, Oakland, July, 1868
"Superheater causes a use of 50 lbs. steam instead of 60 lbs.; use much less water, and there is a saving in fuel."

HAVILAH M. CO., Cal., August, 1868
"Superheater causes a use of 40 lbs. steam instead of 60 lbs.; use much less water, and there is a saving of fuel." (2 acts.)

SIXTH MECHANICS' INST. FAIR, S. F., Sept. 4, 1868.
"Superheater used proves that it saves fully 30 per cent. in fuel." (Chief Engineer.)

NEVADA MILL, Virginia City, May 30, 1869.
"Superheater is a perfect success, and saves three cords of wood in ten, or 33⅓ per cent. in fuel; engine works better."

And many other letters of the same tenor.

Awarded Silver Medal, Mechanics' Institute, San Francisco, 1868.

Awarded Silver Medal, Maryland Institute, Baltimore.

Awarded Silver Medal, American Institute, New York, 1865.

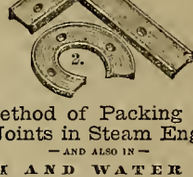
JOHN L. CONSTABLE, Engineer. 25v18tf

The Most Important Invention of the Day.

HALL & LEE'S



New Method of Packing Stationary Joints in Steam Engines,

— AND ALSO IN —

STEAM AND WATER PIPES.

BY THIS METHOD OF PACKING THE JOINTS ARE made perfectly steam-tight inside as well as outside, thereby effectually preventing the steam from cutting into the joints of the steam chest. Consequently, an Engine packed after this method will last twice as long as it will when other Packing is used; and the joints may be opened and closed every day, and they will be steam-tight every time they are closed, and the same Packing will remain good forever. Consequently, owners of mills will make a great saving, both in time and money, by having their engines packed by this method. Patented June 8th, 1869. By permission we refer to A. J. Binney, Supt. Northern California Railroad, and A. D. Starr & Co., Proprietors of the Buckeye Mill, Marysville, State, County and Mill Rights for sale by A. H. HALL & H. T. LEE, Marysville, Cal. 6v19-3m

A Long Desired Article

FOR CLEANING THE HEAD AND HAIR. THE CLEANing of the head and hair has been the subject of consideration for a long time. This object will be accomplished by using

CAMILLE CHAMPOO,

which not only does away with the poor soap so offensive to use, and so injurious to the hair, but it cleans the head, strengthens and beautifies the hair, preserves the color and prevents baldness. It is cooling in nature, and can be used with safety and reliance on the smallest infant. Price 50 cents per bottle. Prepared by EMERTON & UELLING, 773 Mission street, San Francisco, Cal.

HEATHFIELD & BOGLE, Wholesale Druggists, 200 and 208 Battery street, San Francisco, sole Agents for the Pacific Coast. 24v18 3m

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the PRESS from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers or others will please inform us.

Familiar Science.

Changes in the Earth's Surface.

To the casnal ohserver the "solid earth" on which we tread, and the hills and valleys which surround us, appear firm and unchangeahle, except when moved by some terrihle convulsion of natnre, snch as an earthquake or volcanic outhreak. Yet long-continued and careful ohservations show that almost every section of the earth's surface is slowly, bnt surely and constantly, changing its position with reference to neighhoring sections. The solid earth is not as solid as it seems, bnt is slowly heaving up and down in great waves—when one part goes np another goes down. Wherever careful geological examinations have heen made, it appears that there is scarcely a mountain or a valley which has not been snhjected to repeated oscillations of this character. These undulations do not partake of the progressive movement which we usnally associate with wave motions; hnt are more like elevations and depressions caused hy forces from beneath, being alternately pnt forth and withdrawn. The "everlasting hills" are only the frozen ripples of this world-wide undulation, which the falling rains and rnnning rivers are constantly wearing away. The sharp eye of the geologist has detected and measured the movement of these earth waves, and has pointed them out on almost every portion of the earth.

Here an old historic plain has been converted into marsh and meadow; there the site of an ancient city, once hy the seaside, is now beneath the waves; while yonder hoth harbor and city are a good mile inland. In some places the action of rivers has effected changes, as in the delta of the Ganges and the Nile; in others, rains and frosts and volcanic scoriæ have been the agents; while by far the most numerons and extensive changes can he attributed to no other canse thau the gradual upheaval or subsidence of the earth's crust itself. Maps have heen constrncted to show the changes which have been made along the sea shores of Europe and the British Isles. Some of these changes are deduced from geological data, and are, of conrse, the result of countless ages; others, drawn from historical data, show that two or three thousand years are sufficient to so materially change many localities as to seriously interfere with commercial movements.

Observations made during the last fifty years npon the great lakes of this continent, render it extremely prohahle that the ports employed for the commerce of that region will in time have to he changed to other locations. It is now a well established fact that nearly the entire west coast of South America is rising so rapidly from the sea that many of the best harhors on that coast will soon he worthless. The same is true of the coast of Sweden and of all the region ahont the islaud of New Foundland.

On the contrary, England, at some points, is sinking into the sea; although, in other localities, the reverse is true. Many parts of the Atlantic sea coast are also sinking, especially in Georgia, South Carolina, Florida, New Jersey and Massachusetts. Some parts of the New Jersey shore, it is estimated, are sinking as rapidly as two feet in one hundred years. Near Cape May, the sea, in some places, has advanced inland nearly a mile, and in one place a sea-side hotel has heen moved inland twice within a hundred years to keep it away from the encroaching waves; although it was first erected a full half mile from the water. There are portions along the northern coast of the Indian Ocean where there is evidently a slow subsidence in progress, while portions of the coast of China are evidently rising.

It appears, then, that the actual condition of the earth and the limits of the sea are by no means fixed. The canses which have fashioned the surface of the globe and produced the Alps of Europe, the Himalayas of Asia, and the Cordilleras of the New World, have not yet ceased their action. It is evident that the thickness of the terrestrial crust is yet hnt a fraction compared to the mass of the earth. The earthquake and volcano, more strikingly indeed, but not more surely, than the slower movements ahove mentioned, show us that the pent up energies of internal fires are yet at work—that they threaten unceasingly. Science, however, teaches us that these energies are gradnally dying ont, and that we need fear no future general catastrophe, like that great volcanic outhreak which preceded and prodnced the glacial epoch. Moreover, it is the Christian's privilege to feel that the Divine Power which has gradually built np the the earth—progressing from inorganic to organic existence, and thence advancing from mere animal life to intelligence, approaching even to that of divinity itself, will not retrograde, bnt rather add to the glories of His works hy the development of heings still more perfect, and with moral qualities and intellectual powers of which man, in his present condition, can form no adequate conception. Rather than look forward to another destructive convulsion, whereby man may he swept from the earth, shonld we not sooner remember the "bow of promise," and look forward to the time when the inhabitants of the earth may "be as the angels of God?"

The Blessings of Sun Light.

All the material blessings which we enjoy npon earth come to us through the agency of sun light. Our clothing is borrowed from the snn; the fiber, whether from vegetahle or animal, owes its growth to the direct action of the sun's rays. So of the hread which we eat. The delicions steak or flavory roast of our repast, was nonrished npon the products of sun light. The wine which sparkles, is hut bottled snnshine; and the water is maintained in the pehhly hrook hy the evaporating influence of the same great luminary. Our sngar, tea, coffee and spices, are hut the embodied influences of a tropical snn. The great motive agent of nearly all our mechanical power and the source of artificial warmth, is bnt sunshine solidified long ages hefore man existed, and stored up in the earth to he liberated for his benefit in these latter days. When we go to regions where the sun is not, desolation and darkness reigns. Without the snn, the hlood in our veins would cease to flow, and man would die. The great and mysterious forces of heat, light, electricity and chemical affinity, "dancing their magic round, and alternately assuming each other's form and action," are mere emanations from the same great central source from which issue all other hlessings, that contribnte to man's happiness and existence. How grand, heautiful and simple is the plan of creation, as revealed in the light of science. Its simplicity and nnity are completely consistent with the attributes of Deity as revealed in the Book of Books.

Singular Development of Heat in the Fusion of Tin with Platinum.—A very extraordinary exhihition of heat is developed in fusing together platinum and tin, when performed in the following manner: Take a small piece of tin foil and wrap it in a piece of platinum foil of the same size. Expose the pellet so made npon charcoal to the action of the blow-pipe; the union of the two metals will be indicated by a rapid gyratory motion, and hy an extreme hrilliancy of the light emitted—showing that an extraordinary degree of heat is being developed, and in a remarkahle mannor. If the glohule thus melted is allowed to drop into an earthen hasin filled with water, it will remain for a minute red hot at the bottom; and snch is the intensity of the heat developed, that it will melt and remove the glazing from that part of the basin with which it comes in contact.

The Railroad and the Telegraph.—It is said that the receipts of the telegraph have fallen off ahout one-fourth since the completion of the Pacific Railroad. Mail communications are now so rapid, that the public will not pay the high prices charged hy the telegraph company. A reductiou of rates to one-half wonld donhtless add to the net profits of the company and greatly subserve the commercial interests of the Pacific Coast.

For years the Mining and Scientific Press has been one of our most welcome exchanges from San Francisco, because of its sterling merit in publishing valuable information concerning mining operations, new discoveries in quartz milling, mechanical inventions, which rarely ever is seen in our daily newspapers.

Every office connected with a mine, and every quartz mill, and every hoisting work over a mine ought to take a copy of the Mining and Scientific Press. The cost is only $5 a year.

The publishers of the Press are also Patent Agents, and inventors or improvers in the mechanic arts who desire to file caveats, or to obtain their final patents, can have the business promptly and honestly attended to through the agency of Dewey & Co.—*Gold Hill News, July 9th*, 1869.

San Francisco Verein.—We acknowledge the receipt of an invitation to attend the "Bundesturnfest," to take place at Hayes' Park on the 22d, 23d and 24th inst.

The Eastern visitors to California know enough to provide themselves with Muller's tourist's glasses before proceeding to see the rocky cliffs, 3,000 feet high, in the Yosemite Valley. ***

Costa Rica Mahogany can be had on very reasonable terms of Hobbs & Gilmore, Market street, near Beale. ***

Continental Life Insuraoce Co., 302 Montgomery street, corner of Pine.

Returned.—Dr J. H. Paino, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. Howland.

Co-Operative Union Store.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco 21v18-4w

Dr. Hall has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs. Curling, Druit, Lee, Parker, Acton, Aitken, Churchill, Ricord, Velpeau, Bocch, Sperino, and Hewlitz Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's. San Francisco 21v18-3m

Asiatic Cholera.—The Strongest Proof of Intrinsic Merit.—Dear Sir: I ought to have acknowledged long ago the box of Pain Killer you had the goodness to send me. Its coming was most providential. I believe hundred of lives were saved, under God, by it. The Cholera appeared here soon after we received it. We resorted at once to the Pain Killer, using as directed for Cholera. A list was kept of all to whom the Pain Killer was given, and our native assistants assured us that eight out of every ten to whom it was prescribed recovered. It has proved an incalculable blessing to multitudes of poor people throughout all this region. Our native preachers are never willing to go out on their excursions without a supply of the Pain Killer. It gives them favor in the eyes of the people, and access to families by whom otherwise they would be very indifferently received. Believe me, gratefully and faithfully yours, J. M. JOHNSON, Missionary, Swatow, China.

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.

Information for Inventors and Patentees.

AN EXTRACT

From the American and Foreign Patent Agency Circular of the Mining and Scientific Press, Dewey & Co., Publishers.

Patent Rejections.

FIRST. Refusals are always made by the Patent Office if there is any informality in the specification, or if it does not contain the entire subject matter of the invention, and is not properly arranged and stamped. A slight omission often proves fatal.

SECOND. If the drawings are defective, and are not executed in an artistic manner in India ink, and on sheets of the required size, they are subject to rejection.

THIRD. Applications are always rejected where the claims conflict with others already patented.

If the rejection should be an unjust one—which sometimes happens—it can generally be reversed and the patent obtained by contesting the case.

Taking it for granted always that when an inventor makes an application that he is in earnest, we will guarantee to secure the patent if it is possible to be had.

Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unsurpassed facilities in securing favorable results. We have been successful in securing Letters Patent in many such cases. Our terms are very moderate.

Our long experience as editors and publishers M. & S. P. guarantees our familiarity with most of the subjects of patents on this coast, and insures inventors a more ready understanding of their cases than they can secure from any other quarter.

It is not the duty of any government official in or out of the Patent Office to prepare patent papers, or make models. These must be provided by the applicant or his attorney, according to law, *otherwise his claim will not be considered.*

Dangers of Delay.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

Keep Right Along!

DON'T STOP, because you have made one invention which did not prove a success. If you were anticipated by some one who had previously put your ideas into successful practice, it shows you *can* invent.

DON'T WAIT the result of your application for a patent, no matter how valuable may be your invention. Go ahead with your business. Don't be idle.

DON'T STOP because you have made one, or a dozen good inventions. Dispose of a portion, and go ahead. If you have talents, use them. They will be improved thereby, and yourself and community benefitted.

Few inventors introduce or sell their patents too quickly, while hundreds are too slow, and are overtaken by the march of improvements.

Advancing Cases.

If any case placed in our hands meets with rejection, we do not wait to write and inform the inventor of this fact, (as is the case with most agents,) but our representative at Washington proceeds at once to examine the stated objections, and if it be not a just and unavoidable decision, the claims of the inventor will be presistently argued before the Examiner, and if possible the decision reversed.

Inventors on the Pacific Coast, located at great distance from the Patent Office, of all others, should be careful to avoid inexperienced, dishonest, or otherwise unreliable and irresponsible agents.

Inventors having models in our possession must send written orders when they desire any particular friend to see them.

Established in 1860.

Our business has been long and successfully practiced, and we are thoroughly responsible for the confidence and valuable trusts placed in our charge. Our advice can always be relied upon as correct.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with and have full records of all former cases, and can more correctly judge of the value and patentability of inventions discovered here, than any other agents.

☞Our Illustrated Pamphlet, from which the above is an extract, will be furnished free on receipt of postage stamp. Confidential advice given, and every legitimate branch of Patent Soliciting business promptly and faithfully executed, by

DEWEY & CO.,

Publishers Mining and Scientific Press, 414 Clay street, San Francisco.

WATERING STREET-CAR HORSES.—A recent invention for watering the horses employed in street cars, or elsewhere, without stopping, is so planned that the driver can by pulling a string let the water from a tank on the top of the car through a flexible tube into the bit, which is made hollow and pierced with holes. The animal soon learns to drink in this way.

Important to Inventors.

MARYSVILLE, CAL., August 13th, 1869.

MESSRS. DEWEY & CO.—GENTS:—Enclosed find $20 (currency) for last fees on patent for gang plow. I am very much surprised, after opinions received from Munn & Co. I am, respectfully, yours, F. A. H.

The original of the above letter (and many others with similar reference to other agencies) can be seen at this office, in cases for which we have secured patents for inventors who had been denied patents, or who had paid for being told that they could not obtain patents. Inventors on the Pacific coast are fast learning to patronize first-class home agents, who better understand their cases and will give more thorough attention to every invention entrusted to their keeping.

DEWEY & CO.,
U. S. and Foreign Patent Agents.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.,

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT.

Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S. Hallidie & Co., 419 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

GALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale of like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

Mining Notices--Continued.

Alleghany Consolidated Gold Mining Company, Sierra County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixth day of August, 1869, an assessment of fifty (50c) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the seventh day of September, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the twenty-third day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, 37 New Merchants' Exchange, California street, San Francisco. au7

Cordillera Gold and Silver Mining Company.—Morelos District, Chihuahua, Mexico.

Notice is hereby given, that at a meeting of the Board of trustees of said Company, held on the twenty-third day of July, 1869, an assessment of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 321 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of August, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the ninth day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HENRY R. REED, Secretary.

Office, 321 Washington street, San Francisco. jy24

Daniel Webster Silver Mining Company.—Location of Works: White Pine District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of June, 1869, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office.

Any stock upon which said assessment shall remain unpaid on the thirtieth (30th) day of July, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the nineteenth day of August, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.

Office, 418 California street, San Francisco, Cal. jy3

POSTPONEMENT.—The day for deeming stock delinquent on the above assessment is hereby postponed until Friday, the twenty-seventh day of August, 1869, and the sale thereof until Thursday, the sixteenth day of September, 1869. By order of the Board of Trustees.

jy31 O. D. SQUIRE, Secretary.

French Silver Mining Company.—Location of Works: White Pine District, (formerly Lander County), State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of July, 1869, an assessment of five (5c.) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 502 Montgomery street, Room No. 3, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of August, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before will be sold on Monday, the thirteenth day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

AUG. DuPRAT, Secretary.

Office, No. 502 Montgomery street, Room No. 3, San Francisco, Cal. jy27

George Washington Silver Mining Company.

Location of Works: White Pine District, Nevada.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the first (1st) day of July, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. certificate.	No. Shares.	Amount.
H K Snow	unissued	276	$27 60
J B Scott	unissued	1622½	162 25
J J Ryan	unissued	1000	100 10
C A Kidder	unissued	500	50 00
W J Nightingale	2	138	6 90
Geo W Vincent	33	138	6 90
W H Stanley	64 to 66 10-ea	300	15 00

Office, No. 11 Hayward's Building, 419 California street, San Francisco. jy31

Kincaid Flat Mining Company, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of August, 1869, an assessment of two dollars and fifty cents ($2.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 220 Clay street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eighth day of September, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the twenty-fifth day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. H. CROWE, Secretary.

Office, 220 Clay street, San Francisco, Cal. au7

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding months of delay requisite in transacting business through Eastern agencies.

Lyon Mill and Mining Company, Kelsey District, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty first day of July, 1869, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the thirtieth day of August, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twentieth day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M BUFFINGTON, Secretary.

Office, Room 37 New Merchants' Exchange, California street, San Francisco. jy24

Marlborough Silver Mining Company.—Location of Works: White Pine District, (formerly Lander County), State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of July, 1869, an assessment of five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 502 Montgomery street, Room No. 3, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of August, 1869, shall be deemed delinquent and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirteenth day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

AUG. DuPRAT, Secretary.

Office, No. 502 Montgomery street, Room No. 3, San Francisco, Cal. jy24

Office Senntor Silver Mining Company.—Location of Mine: Storey County, State of Nevada.

NOTICE.—The Annual Meeting of the stockholders of the Senator Silver Mining Company will be held on WEDNESDAY, the twenty-fifth day of August, 1869, at one o'clock P. M., at the office of the Company, No. 408 California street, for the purpose of electing a Board of Trustees to serve for the ensuing year, and for the transaction of such other business as may properly come before the meeting.

T B WINGARD, Secretary.

San Francisco, August 6th, 1869. au7

Silver Sprout Mining Company.—Location of Works and Mines: Kearsarge District, Inyo county, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-seventh day of July, 1869, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 418 California street.

Any stock upon which said assessment shall remain unpaid on the thirty-first day of August, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twentieth day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary.

Office, 408 California street, San Francisco. jy31

Thunderbolt Mill and Mining Company.—Location of Works: White Pine District, Nevada.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the first day of July, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
J B Scott	unissued	5820	$291 00
H K Snow	unissued	1110	55 50
C Robinson	unissued	2200	110 00
Catherine Caffrey	3	50	1 25
Geo W Vincent	24	555	13 88

K K Snow	31	200	5 00

And in accordance with law, and an order of the Board of Trustees, made on the first day of July, 1869, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, on the thirtieth day of August, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

THOS. J. OWENS, Secretary.

Office, No. 10 Stevenson Building, San Francisco, Cal. jy14

Wells Mining Company.—Location of Works: White Pine Mining District, White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the tenth day of August, 1869, an assessment of thirty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 439 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Friday, the seventeenth day of September, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the seventh day of October, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. H. RUSSELL, Secretary.

Office, No. 439 California street, San Francisco. au14

Yosemite Mining Company, Humboldt County, Nevada.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the second (2d) day of July, 1869, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
W N Wade	148	315	$157 50

And in accordance with law, and an order of the Board of Trustees, made on the second (2d) day of July, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. S. L. Jones & Co., auctioneers, 207 and 209 California street, on Tuesday, the twenty-fourth day of August, 1869, at the hour of 1½ o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

D. H. CROWE, Secretary *pro tem.*

Office, No. 220 Clay street, San Francisco. au5

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low 10v17tf

The Pennsylvania Silurian.

The following is a paragraph from an editorial upon the Pennsylvania Railroad,—in the *U. S. Railroad and Mining Register* of July 31st: "From Philadelphia to Harrisburg the traveler steams over the surface of the oldest deposits known to geology—so old that they have suffered all the changes of external posture and internal structure which the shrinking of the earth's crust, the slow chemistry of moisture, warmth and elemental affinities and the eroding powers of the atmosphere, combined and incessant, could effect. The strata lie in steep and contorted shapes, scarred with seams and gashes filled again with crystalline quartz, or carbonate of lime, deprived of their original granular constituents and of every trace of animal or vegetable life, the sands converted into granite and gneiss, the mud into mica slates and talc slates, the limestone into marble. Only in this belt of lower silurian and sub-silurian formations could the scientific tourist be arrested to examine serpentine quarries, nickel and chrome-iron mines, or saccharine white marble. Only here would it be worth while for the returning Californian to try his pan for gold. Infinite ages have reduced the Alpine range which once lifted its peaks thousands of feet into the air where Philadelphia, Westchester and Havre de Grace now lie, to a rolling plain nowhere more than six or seven hundred feet above tidewater. The observer must carry with him his aueroid harometer and watch the oscillations of its index, to be aware that he passes a summit of 542 feet above the Schuylkill river before he descends into the Chester Valley at Downington. Smiling fields of corn and dairy farms, spread out where in the earliest ages of the earth glaciers descended between aiguilles (needle-like peaks) pointed upwards from fields of everlasting snow."

AERIAL NAVIGATION.—"The dynamic difficulty offered hy the atmosphere is as serious a hindrance as the power of the winds. It arises from the yielding nature of the air, and the difficulty of getting any efficient resistance to the wings or propellers that must he used. In steamboat navigation the same difficulty exists from the fact that the water does not firmly resist the paddles. The power is wasted on the yielding medium, and this loss, which is techuically called "the slip," would be ahout eight hundred times greater in the atmosphere, from its greater lightness. We are not aware that any exact calculations have heen made of the enormous waste of power in acting upon the atmosphere by any species of wings, nor has it ever heen determined whether any arrangement of whirling or flapping propellers can he used without enormous additional waste of power from the nature of the apparatus. With all these drawhacks, however, flying is still a mechanical possibility."—*Iron Age.*

SOAP GREASE AND WHISKY.—A company formed in Chicago will soon he distilling alcohol and extracting soap grease from ordinary city garhage. The process is a patented one, and consists in taking the garhage just as it is hauled off in the city carts, dumping it into tight tanks, and boiling six hours at a temperature of 212 degrees. This dissolves the whole mass, which is run into fermenting tuhs and worked with yeast. The soap grease and impurities rise to the top of the tuhs, and are skimmed off, and the residuum is distilled in the regular way. It is estimated that each barrel of garbage will yield three pounds of soap grease and four gallons of proof spirits. The soap grease is o course as good as any other, but the alcohol hetrays its origin hy an odor which requires further processes for its removal.—*Stockholder.*

THE MOUNT WASHINGTON "SKY RAILWAY."—The station at the hase of the mountain is six miles from the Fahyan place. The road ascends the mountains in a tolerahly straight course, following the general line of the old Fabyan bridle path. The upper depot is 2,685 feet ahove the level of the sea, or 1,117 feet ahove the White Mountain House. This leaves a grade of 3,600 feet to be overcome, as the hight of the mountain is 6,285 feet ahove the level of the sea. The heaviest grade is at the rate of 1,906 feet to the mile, and the lightest 440 feet. The reader may realize the proportions of the steepest grade just mentioned hy placing a plank some thirty feet long one end at the hase-hoard of a room twenty-eight feet long and eight feet high and the other end against the opposite wall near the ceiliug.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,

SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing Furnaces Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hausbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first-class work, and we intend to do no other.

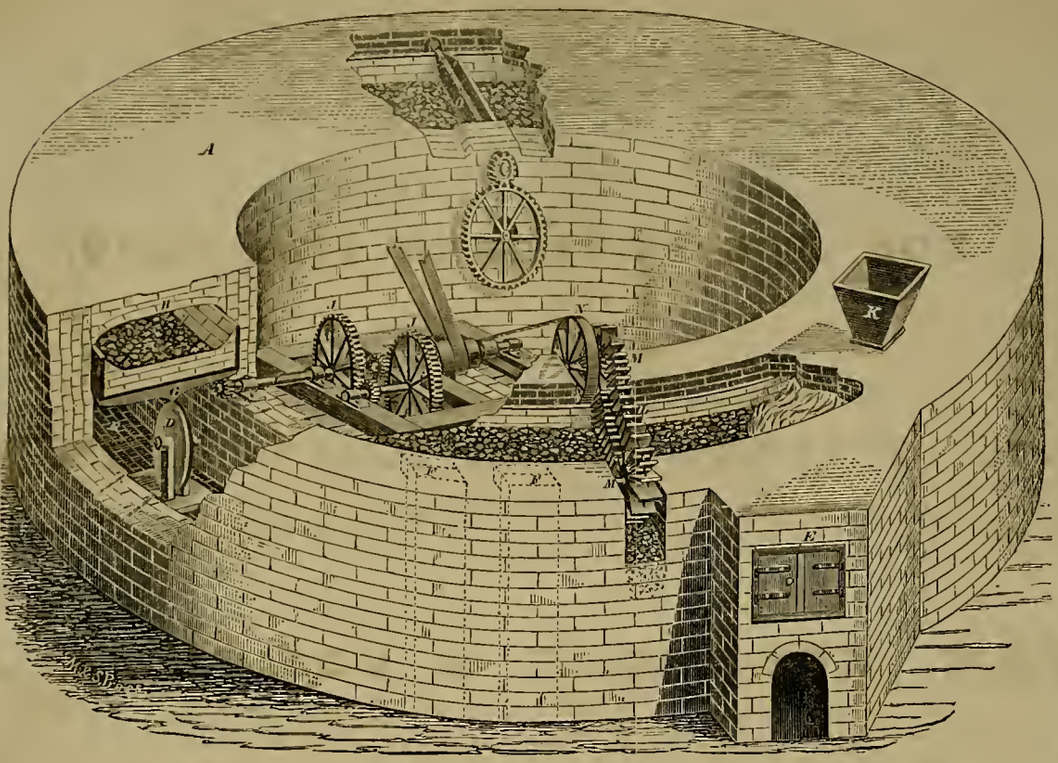
No. 629 Washington street, San Francisco.

P. S.—Where six watches of the above are ordered at one time, we will send one extra, free of all charges.

We also deal in the finest Gold and Silver Watches, Watch Materials, etc. Send for circulars or prices.

7v19 4t

Fred. Ernst's Patent Rotary Roasting Furnace.



This is a mechanical furnace, which does away entirely with manual labor, excepting a fireman. It charges, roasts, stirs, and discharges the ore by a very simple mechanical contrivance,—in fact performs all the operation required in the oxidation or chlorination process of roasting gold or silver ores.

The ore is taken by means of an elevator from the battery, and is discharged constantly and regularly into the hopper, *K*, from whence it reaches the rotating hearth, *G*. This hearth consists of a cast iron orbicular ring paved or lined with bricks, and revolves on a series of iron rollers, *D*, and is kept continually in motion by means of the gearing, *J*. This gearing has two gear wheels, three feet in diameter, and pinions to regulate the speed from the cone pulley, increasing or diminishing it to conform to the required slow motion of the hearth, *G*. The hearth so charged and running constantly carries the ore into the first heat, which is next to the flues, and so passes all the different temperatures of the furnace, thus effecting a very uniform heating and chemical action on the ore; at the same time it has also to pass the stirrers, of which there are different kinds,—stationary and movable ones,—the number and speed of the latter varying according as the ore contains more or less sulphur. The movable paddle stirrers are shown at *O*. These movable stirrers are connected with the gearing under the iron bed of the hearth, *G*, as shown at different points, until it passes the fire-bridge, where it receives its ultimate and highest heat, and is then discharged by the discharging apparatus. This discharging apparatus consists of two chain or rag wheels, *M*, *M*. These two chain-wheels drive a double endless chain with inserted plates of iron (scrapers). The chain hanging loose underneath between the wheels draws these iron plates through the cavity of the hearth, and so discharges constantly the roasted ore. The construction of this furnace is of the simplest kind, and all the necessary castings can be easily transported even on mule-back. The loss of the silver by sublimation in present furnaces, it is claimed, is avoided in this, as the silver condenses before reaching the flues; the distance being great, and the heat diminishing gradually until the gases reach the point of final exit. Liberal terms are offered to parties who desire to use this furnace. Further information can be had by addressing the Inventor and Patentee,

To keep the current of air constant throughout the whole length of the furnace, the arch over the hearth decreases slightly from the fire-bridge toward the flues. For concentrated sulphurets it may be advantageous to increase the circumference of the hearth. The advantages claimed as attainable from the use of this machine are—the doing away with a large portion of the costly hand labor ordinarily required, and the better and more thorough accomplishment of the same by machinery. A great saving of fuel, not only through the length of the hearth, but also for the reason that all the gases which are lost by other furnaces are economically employed in this as a substitute for other fuel.

The furnace is so constructed that the large access of air required for the oxidation of the ore, in addition to that demanded for the consumption of these gases, does not operate to materially lower the temperature in the furnace. When the ore in this furnace is once desulphurized, the gases cannot form any new combination with the ores or metals therein, for the reason that while the currents of air and gases are moving to the rear, the furnace hearth is constantly advancing in an opposite direction.

F. ERNST, San Antonio, Lower California, Mexico,

Or by calling upon H. W. SCHMIDT, Druggist, Kearny street, corner of Sacramento, or at this office.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the office, **229** Fremont street,

1v1 San Francisco.

REBELLIOUS ORES.

THE HAGAN FURNACE.

The above method for the purification of Rebellious Ores is respectfully offered to the public. Repeated actual workings show that the

HAGAN FURNACE

Will accomplish all that the Reverberatory Process will do, and at an expense that is merely nominal. It has never failed to treat any ore effectually.

It has never been claimed for it that it will extract gold from ores which do not contain any of that metal.

Parties owning rich but refractory veins, can treat with the undersigned upon the basis of

GUARANTEED RESULTS,

With responsible security. For an interview, and all desired particulars, address

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering. 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology, and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

Wood Working Machinery.

W. O. M Berry & Co. 114 California St San Francisco.

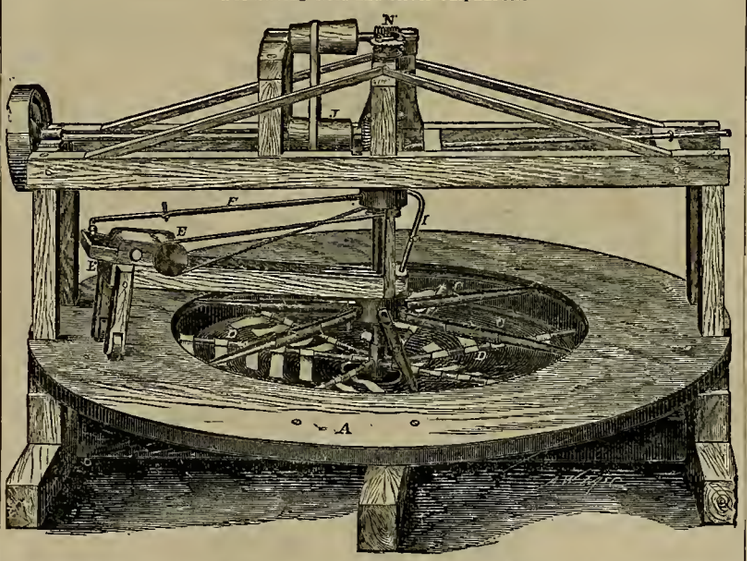
Embracing Mortising, Saw and Moulding, Slat and Door Tenoning, Boring, Shaping, Scroll Sawing, Planing, Rad and Dowell making and Re-sawing Machines, Wood and Engine Lathes, etc., for sale at Eastern prices, at the Machinery Depot of

W. O. M. BERRY & CO.,
114 California st., San Francisco.

☞ Agents for Blake's Patent Steam Pump, (warranted the best in the market); Davis & Furber's Woolen Machinery, etc. Being the selling agents for most first class Eastern builders, millmen and others in want of Machinery can save money by giving us a call. Illustrated Catalogues sent free. Address W. O. M. BERRY & CO., 114 California street, San Francisco. 3v19tf

PAINE & STEPHENS' IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.



One Machine, costing about $1,300, is sufficient to work the Sands from 25 to 30 Stamps,

Less power being required than for any other Machine. The attention of quartz millmen throughout the State is directed to the subjoined certificates, and if they desire they can visit the Amador Mining Co's mill, near Sutter Creek, the Eureka Co's mill at Grass Valley, or the Banner Co's mill near Nevada, and see for themselves.

CERTIFCATES:

Grass Valley, Jan. 4th, 1869.—This is to certify, that we have used the Paine, Stephens & Harry Concentrators for over twelve months. They have given us entire satisfaction, and are the best we ever used. WILLIAM WATT, Supt. Eureka Mine.

This is to certify, that we have had in use for the past 18 months one of Paine, Stephens & Co's Sulphuret Saving Machines, constructed by John T. Harry, (called a buddle,) and which operates satisfactorily, particularly so in saving fine sulphurets, and we recommend it as well worthy of use, even where other Concentrators are used above it, as it will pay if there are any sulphurets.

WM. L. TISDALE, Supt. Star Spangled Banner Mine.

Nevada City, Oct. 26, 1868.

Any one wishing to purchase one of these useful machines, can do so by applying to THOS. N. PAINE, at Grass Valley, Nevada County, or JOHN T. HARRY, Sutter Creek, Amador County.

The Money Market—Foreign Capital.

Active and successful efforts have been made within the last few days to remove the pressure from the money market, so that the grain, which is coming in so rapidly, might be freely handled, and business generally be placed upon a more satisfactory footing. The result of these efforts will be the immediate addition to our local capital of from three to five millions of dollars. We may remark in this connection, that one of the best evidences of the permanency of our resources may be found in the gratifying fact that during the very height of our present financial embarrassments, a large amount of foreign capital has been directed to our shores for investment, through the London and San Francisco Bank. Since the completion of the Pacific Railroad, one of the English Directors of that institution has visited this state and city, and became so thoroughly impressed with the reality and vastness of our resources as to recommend an immediate increase of the capital of the bank from one, to three and a half millions of dollars. One million has already been drawn, and the balance is about to be called for. A still farther sum of two and a quarter millions, will be added in the spring, if in the judgment of the manager here, it shall be thought expedient. These facts not only afford a gratifying evidence of the judicious financial management of our former Governor and Senator, Hon. Milton S. Latham, but also furnish an assurance that there will be no lack of means at our disposal, to give full employment to the vigorous enterprise of our citizens.

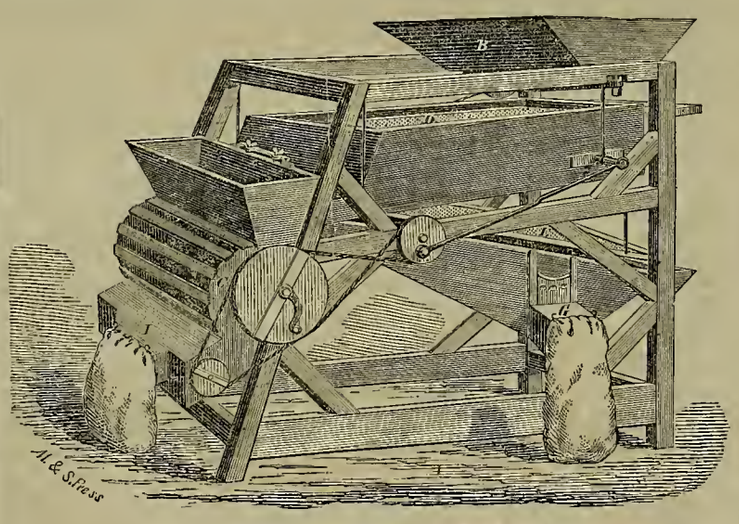
MERCHANDIZE AND TREASURE.—The merchandise exports from this city for July were $1,537,274 in value; $86,661 in excess of the same period for the year 1868. Thirty-five per cent. of this value was flour and wheat. The aggregate exports of the first seven months of the present year have been $10,282,642; a decrease of $913,559 from the same period of 1868. The treasure exports for July were $2,570,244; a decrease of $724,185 from July of 1868. The treasure shipments for the year, up to August 1st, have been $23,616,470; a decrease of $439,148.

CARL SHURZ, U. S. Senator from Missouri, arrived in this city last night. He was received at the landing by the German military and his fellow countrymen.

Crowley's Patent Grain Separator and Mixer.

Farmers on the Pacific Coast have shown more readiness to take advantage of new and improved machinery for putting in and harvesting crops than have the husbandmen of any other State in the Union. While this may be said in regard to their sagacity in producing crops, we believe they have been less choice in their method of preparing their cereals for the market, and perhaps have shown still greater negligence in the selection or preparation of the seed for sowing.

But as competition becomes closer, and buyers must figure upon smaller margins, and consumers become more discriminating in regard to quality, our farmers must for the future necessarily be more careful in these matters; and hence we find our local mechanics are devising and constructing new machines for cleaning grain.



CROWLEY'S PATENT GRAIN SEPARATOR AND MIXER.

We give to-day an illustration of an improved machine for separating and cleaning grain, it being used, however, more especially for cleaning wheat, and it has connected with it a device for immediately mixing the grain with a solution of sulphate of copper (commonly termed bluestone by the farmers), when it is to be used for seed, thus effectually preventing smut, and also protecting it from the ravages of birds and animals.

The grain is first emptied into a hopper, *B*, and is discharged through an adjustable feed gate, upon a series of shaking screens, *D*, which are so arranged that the crushed seeds and chaff will be caught by the first screen, the barley and oats by the next three, while the fair wheat which is fit for seed will be caught by the next screen, and discharged from it into the mixer, *C*. A finer screen, *E*, placed just below the one last mentioned, catches small wheat and saves it; but allows mustard and similar small seeds to fall upon the ground, or it may be saved and sacked at *G*. The mixer, *C*, is partially filled with a solution of sulphate of copper, and the wheat is stirred and intimately mixed with this solution by revolving stirrers, after which it is discharged over a screen which frees it from surplus moisture, and passes it to the sacks, or trough, which may be placed below the spout, *I*.

The machine works equally well for cleaning wheat alone without using any mixture. When constructed for warehouse and mill use exclusively, the mixing apparatus is left out of its construction.

The inventor claims that his device is simple and cheap in construction, not likely to get out of repair, and can be easily adjusted and operated.

This invention was patented through the Agency of this office, June 8th, 1869, by James J. Crowley, who now has the machine on exhibition at his shop, corner of Sixteenth and Valencia streets, near the Mission Dolores, in this city. Mr. Crowley is a young mechanic, who has for several years given much consideration to the construction of his machine. He proposes to sell machines and territorial rights.

It is very important that farmers should carefully separate their seed grain, so as to avoid sowing the smaller and inferior kernels, mustard, cockle, and other troublesome seeds; and we therefore take pleasure in calling attention to this machine, which we presume will be on exhibition at the Mechanics' Institute Fair. We believe the mixing of sulphate of copper with seed wheat is becoming more general; and Mr. Crowley's method of mixing is certainly a great improvement on the ordinary method of introducing the so-called "bluestone."

THE POWELL-COLORADO PARTY were in camp at the junction of White and Green rivers (headwaters of the Colorado) on the first of July, and would remain there until the sixth. All well.

DRAIN OF CAPITAL FROM THE MOUNTAINS.—The mountain papers are complaining of the drain of capital from the mountain districts to the cities. During the past year not less than $126,850, of profits derived from mining in Bridgeport township, Nevada county, has found its way to other parts of the State for investment. The Nevada *Gazette* says the whole county is being drained in the same way. Miners, as a general thing, are too much engaged in their mining operations, to pay personal attention to outside investments; hence they look for well established and paying stocks or real estate in which to invest. If our mountain friends wish to retain the profits of mining in their respective localities, they must establish manufacturing enterprises in the mountains, and prove to the miners that there is no necessity for their going abroad to seek safe and profitable investments. When a beginning is once made, and prosperity attained, business may be indefinitely increased with home capital. Until then, miners, as heretofore, will continue to send away their surplus earnings, and mountain towns will pass gradually into decay.

COL. AUGUSTIN HARAZTHY.—Late letters from the family of Col. Harazthy, in Nicaragua, remove all doubt of his death. He is believed to have lost his footing upon a log-crossing, fallen into the stream, and been seized by one of the alligators which abound therein. Thus has perished a man whose life has been one of adventure. Col. H. was of most active temperament, and was all his life searching out new countries in which to inaugurate some new industry. He was conspicuous in the early California vine culture, and has done much to further the wine interest of our State, both with his pen and by personal experimentation. At the time of his death, he was engaged in carrying on, and enlarging, an extensive sugar plantation.

THE FAIRS.—We are daily hearing of some new invention which has been entered for exhibition at the Mechanics' Fair in this city. The space will be allotted to the different exhibitors immediately. Articles will be received at the Pavilion on the first of September.

The eighth annual fair of the Northern District is now going on at Marysville. The *Appeal* says it is largely attended,—and that the pavilion presented a magnificent appearance on the evening of the 25th, the occasion being the delivery of the annual address by Rev. Dr. McKay.

The State Agricultural Fair commences at Sacramento on the 6th of September.

STREET MUD.—The mud of the paved streets of London has been carefully analysed and found to contain thirteen per cent. of iron, abraded from horse shoes and wheel tires, and about thirty-seven per cent. of animal refuse; the balance consists chiefly of earthy matter abraded from the pavements. Similar results were obtained from the mud of the streets of Dublin.

Communications.

Interesting Geological Observations.

GEOLOGICAL CHARACTERISTICS OF THE SIERRA NEVADA BETWEEN THE HEADWATERS OF THE FEATHER AND AMERICAN RIVERS—SOURCE OF THE ANCIENT RIVERS—COAL.

[Written for the Mining and Scientific Press.]

Standing at a point on Feather river in Long Valley, which may he termed the outlet of Mohawk Valley, we find ourselves just where the most eastern range of the schistose class of rocks is lost to the eyo. The river at this point is running over a mass of homogencous-cemented boulders and sediment of extreme hardness, the cementing material being the washed sediment from lava, the boulders presenting the appearance of having been long enbjected to the action of water. This deposit does not contain any trace of quartz, granite, or gold. Overlying this is a stratum of washed *debris* of granite and quartz containing traces of gold. Following further up the river, another class of conglomerate cement forms the bed or layer over which the river runs. This cement rises on the south side of the river to a perpendicular height of nearly a thousand feet; while to the north, small knobs or spurs of gray granite appear.

Back from the river, rises an abrnpt ridge of igneous slate and trap, forming, as it were, an immense wall to this basin, on the north. The aforementioned cement, which extends to the south for miles, is formed of trap *debris*, sedimentary wash and scorea, and is nearly in all cases *nonauriferous*. It is accompanied by another class of cement, composed of trap rocks principally, having occasioually granite and quartz gravel interspersed. This is also auriferous.

These two kinds of cement-conglomerates cover a vast portion of the middle of Plumas County, the upper or eastern portion of Sierra, Nevada and Placer counties, and present unmistakahle evideuce that this now elevated mass was once the bed of a great lake or chain of lakes, forming the western border of a chain of volcanic basins to the east.

Origin of the Ancient Ca'ifornia Rivers.

This great lake chain evidently formed the source of the old river channels to the west, before and during the eruptive period, and from this locality was also derived the great masses of silicious rocks and auriferous deposits, produced from the consolidation of solfatarous matter in vein form. It is only occasionally that the more primitive class of rocks is fonnd forming the crest of a few high peaks such as Eureka Mountain and the Sierra Buttes further south. These peaks present the appearance of having been directly over the point where the greatest uplifting force was exerted, crowding them up through the general enrrounding mass. Such is the character of the monntain south of onr starting point, on Feather River.

Eureka Mountain and the Sierra Buttes.

This mountain, rising above these beforementioned classes of sedimentary and diluvial cements, like an island, consists of slate on the west and northwest, its center being mostly feldspar and micaceous gray granite, through which passes the famed metalliferous quartz lodes, known as the Eureka Mountain series of ledgee, which have proved to be extensive, permanent and remunerative; having been worked from the earliest days of quartz mining in California. This range of rocks has a trend nearly north and south, taking in its course a somewhat circular form, going north, and being lost to the eye crossing Feather River, under the above-mentioned strata of cement.

The gangue, or accompanying rock of the metalliferous lodes, is a talcose, gneiss and porphyry; and still further to the east, forming the east side of the mountain, is a very coarse feldspathic granite, its feldspar flakes being of a greenish color. On the west, between the schistose, or slate class of rocks, and the granite, is a series of volcanic or mountain limestone, with occasional porphyritic iron veins. This series of rocks, lying nearly in the same order or relation to each other, extends southerly, crossing Jamison Creek and rising, forms the Gold Valley, and Gold Lake ridge in Sierra County, and the celebrated *Sierra Buttes Mountain*, passing across the upper part of Nevada County into Placer County. This class of rocks sometimes loses its coarseness, or texture of grain, and changes from auriferous to copper bearing; but the elementary constituents of the main body of rock remains the same as at other places miles apart on the same range. There is sufficient similarity in the rocks forming the crest of the Sierra Nevada, through portions of Placer, Nevada, Sierra and Plumas, to be recognized as of the same class. The trend of this range through Plumas County, to the north of our starting point, is via. the west side of Genesee and Indian valleys.

Following up Feather River

from our starting point, the country becomes more open and level, till it finally widens and forms what is called Mohawk and Sierra valleys. These valley bottoms are composed of alluvial deposits. While some of the streams, flowing into Feather River, have cut through a deep strata of diluvial and sedimentary rocks, which show marked indications of the valleys having been large lakes, at some earlier period, and which, by Feather River wearing and cutting down its outlet, near the mouth of Jamison Creek, have been gradually drained of their water.

The Coal Lately Discovered

in this neighborhood, lies under this strata of diluvial *debris* deposited from the higher range of primary rocks. Underneath this, is a silicious layer of sedimentary deposit, intermixed with aluminous layers to a depth ranging from a few feet to 400 feet; the river, in places, having wasted this deposit away to its present level, has exposed coal-shale in several places where it forms its bed. The whole class of lacustrine deposits lie in a horizontal strata. The coal is a formation of compressed vegetable matter, which has evidently belonged to the mosses, or cryptogamic class of vegetation. It has a slight dip to the east, and is rent at regular intervals, forming what may be termed "cleavage" of straight lines or seams; showing (where the river has broke through the layer) a joint as straight as if it had been lined and hewn with a broad-ax. These lines have a course two degrees west of magnetic north, and have very likely been caused hy volcanic or subterranean motion, from west to east. The top or uppermost layer of coal has a soft, brown, coffee-colored appearance, resembling mahogany, when first dug; but by exposure to the air, or water near the surface, it changes to a jet black; assuming a grayish color by longer exposure. It is nearly pure hydro-carhon, containing no grit or sandy matter; its residue, after burning, being a fine silicate of alumina, which has been deposited from a solution contained in water. It burns very freely, producing a bright red heat, with consuiderahle flame, and its great length of time under combustion is remarkable. Although it is not fitted for forge purposes (without previous coking) it is well adapted for common fuel and steam purposes. There is a vast hody of such coal, heing from two to six feet thick, extending in a horizontal layer for miles. Eratic blocks of a superior kind to the first-mentioned layer, have beeu found among the gravel at the margin of the river, at low water, which have probably been washed out of some of the deep holes in the hed of the river. This class of coal is similar to Australian "kerosene coal," and is readily inflammable; but after the flame subsides, a white sparkling heat is imparted to iron in the forge. There is sufficient coal strata already discovered to warrant the assurance of an extensive and valuable coal field in this locality, which only requires capital and enterprise for further development.

OLD SIERRA.

USE OF VINEGAR IN COOKING MEATS.—All kinds of poultry and meat can be much quicker cooked hy addiug to the water in which they are hoiled, ahout one-eighth part vinegar. By the use of this, there will be a considerahle saving of fuel and shortening of time. Its action is very beneficial on old, tough meats, renderiug them quite tender and easy to be digested. Tainted meats and fowls will also lose their bad taste and odor, if cooked in this way, and if no more vinegar is added than we havo indicated, there will he uo taste of vinegar acquired.

Overland Railroad—Notes of Travel.

From our Traveling Correspondent.

EDITORS PRESS:—It was a common remark amoug the passengers who camc overland with us, that they had enjoyed the jonrney very much. Every one seemed delighted, and not a word of fault was found with the road or the officials. I douht if a finer pleasure ride hy rail can be taken than the one over the Sierras. The change of climate from the heat of summer to the region of snow, the grandness of the mountain scenery, especially at Cape Horn, and that heautiful view of Donner Lake, just as we emerge from the tunnel, call forth feelings of romance, and we eeem to be passing through an enchanted couutry.

As we skirted close along the Truckee, we could not help thinking what a fine water privilege was running to waste. The etream is large, the descent rapid, and fed as it is by the snow of the mountains, it must be continuous.

We soon reach the region of alkali. The country is level, or nearly so, and the white alkali makes its appearance on the surface in such quantities that it might be collected with profit. If a few cisterns were allowed to fill during the rainy season, with a saturated eolution of the alkali, I presume it would so evaporate during the summer seasou that itwould crystallize out.

Just hefore reaching the station named Palisade, in the region of the Humboldt, we passed a genuine palisade, whose columnar structure reminds one very much of the Giant's Causeway. As we journeyed on we saw signs of alkali almost everywhere, and just at night at the end of the second day, we passed within sight of Salt Lake. At Promontory we changed cars and settled ourselves as comfortahly as we could in a crowded car. The scenery through Echo and Weher cañons is said to he very fine, but as we passed through them in the night, we lost it all. The last portion of the Central and the first of the Union roads we found rather rough, hut not bad. They will soon be made as smooth as any roads in the Union.

An abundance of coal is found along the Union road; first at Echo, ninety miles from Promontory, and from this point on the Carson, a distance of 350 miles. This was a most interesting portion of the ride. Sometines for a distance of twenty miles we could see bluffs, apparently composed of grit, while at their foot coal is fonnd in quite thick seams; a single stratum of the rock could be traced for miles. So abundant is the coal and so easily worked that at one point it is furnished to the railroad company for $3.75 to $4 (currency). The coal is reached through a tunnel, and ie of good quality. These mincs furnish all the coal that is used on this road, and I have no doubt but they will supply the Central after a little. All along this road, also, we saw indications of alkali. The water, however, is used in the boilers of the locomotive, the incrustation being prevented by frequent blowing off, so as to entirely empty the boiler.

You will ask about the Rocky Mountains. I can only answer that, aside from the steep grade through Echo and Weber cañons and a few enow covered peaks to the south of us, we saw nothing of them. We entered upon a hroad plateau which continued all the way to Omaha. When we reached the vicinity of the Platte we found the soil much better; in fact I may say that from this point, all the way into Omaha, it is as fine a country as I ever saw. Omaha, it seems to me, has heen over praised; for I expected too much. Council Bluffs seemed to me to he tho finer town, and I should not be surprised if it was the larger of the two. W. B. R.

COMPASS FREAKS.—A Duluth (Minnesota) paper says: The Assistant Surveyor in charge of the transit on our Towu Site Survey during the past week, at a certain spot, noticed in a distance of fifty feet a change from 11 deg. east, to 17 deg. cast; then in a hundred feet further, hack to 12 deg. east; while five hundred feet further on from 12 degs. 30 min. east it whirled arouud to 30 degs. west (!) and kept at that for three hundred fect, and then got back again to 11 degs. cast. The Surveyor picked up a piece of rock of the species which seem to prevail in that locality, and applied it uear his compass, whon the needle followed it around as it would a true loadstone.

ELY DISTRICT, LINCOLN COUNTY, NEVADA.—A correspondent writes as follows from this District, which is situated about 125 miles cast of White Pine:—"The Meadow Valley company, lately incorporated in San Francisco, is doing a prosperous husiness on their Pioche lode, which is nearly sixteen feet wide, carrying a large amount of argentiferous galena, of great richness, averaging $200 a ton. Many other parties here own good and well defined ledges, equally rich. There are three independent works for reducing the ores, hesides those of that company. The country comprising this district is very favorahle for mining enterprises. The climate is mild even in winter, snow rarely falling over eight inches deep, and even that soon melts. Grass and wood about the miues are plenty, and provisions, which mostly come from the Mormons, are cheap. Flour is ten dollars, currency, beef ten cents, etc. Should parties ever bring mills into this country they will have milling ore of the very best kind to deal with, (Steinberyite) worth from fifty to two hundred dollars per ton. There are ledges of it over ninety feet thick, all paying, within two miles of water (springs) for their mills, with level country all the way from the mines to the water. The ledges are situated in rolling hills, easy of access; either in mica slate or in trap limestone. Should the right kind of impetus ever he giveu to the country, it will beat White Pine. There is ore here that goes as high as ten thousand dollars to the ton, none less than fifty. VERDAD.

THE LOON CREEK DIGGINGS.—A very active excitement has raged throughout this basin, and in Alturas and Adda counties as well, during the past week, and hnndreds of miners and others have etarted for the new gold fields. Loon Creek is a tributary of the south fork of Salmon River, and the diggings are 120 miles east of north from this city. The gold is worth $17 per ounce. Never since the early days of Boise Basin has there heen such a rush. If the gold fields prove anything near as good as expected, the camp will be among the best in Idaho within a year. Another account says: "The diggings are all river claims, and worked by help of wing-dams. The limit of each claim is 200 feet up and down the river and across. So far the claims have paid from $4 to $12 per day to the hand, but no big strikes have heen made. Cody & Burnett, Steve Stemmons, aud others from this vicinity, and a good many more from Placerville and other basin campe—fully 100 in all—have located claims along the river, to a distance of 12 miles, and all seem to have done well."—*Idaho World.*

JAPANESE MATCHES.—Mr. R. Trevor Clarke has stated that the Japanese matches are identical with the epur-fire of the Chinese. He gives the following form for making this beautiful little firework:—Lampblack 5, sulphur 11, gunpowder from 26 to 30 parts, this last proportion varying with the quality of the powder. Grind very fine, and make the material into a paste with alcohol; form it into dice, with a knife or spatula, about a quarter of an inch square; let them dry rather gradually on a warm mantelpiece, not too near a fire. When dry, fix one of the little squares in a small cleft made at the end of a lavender etalk, or, what is better, the solid etraw-like material of which housemaide' carpet-brooms are made (panicular stems of *Arundo Donax*). Light the material at a candle, hold the stem downwards, and await the result. After the first hlazing off, a ball of molten lava will form, from which the curious cornscations will soon appear.—*Chemical News.*

FISH SCALES AS ORNAMENTS.—Fish ecales, snch as those from the carp or salmon, can be made useful as ornaments in fancy dressing and paper work, by first well washing them in warm water, then in salt and water, and well drying them between blotting paper. Wherever the scales would be appropriate, as in a landscape where there is water, or for windows in the sketch of a church or old castle, or for moonlight, or fading sunlight, they may be fixed with gum, and afterwards shaded with a spirit varnish of green or rose color. The hrilliancy of the pearl scales will reflect through the trausparent color applied.

ELECTRO-CHEMICAL DESILVERIZATION.—We hear that M. Becquerol has been experimenting on a new electro-chemical process by which silver can he extracted from its ore without tho tedious and costly practice of amalgamation. He makes nso of a powerful battery with donble liquid elements, separated by porous diaphragms. A trial of tho system in California is meditated.—*Exchange.*

Mechanical Progress.

A New Steam Indicator.

Engineering for July 30th describes and illustrates an ingenious steam power meter recently invented by Messrs. Ashton and Storey, of Manchester, Eng. The upright rod of the indicator piston has upon it a light wheel, which revolves horizontally, against which is gently pressed, by a spring, a wheel which revolves vertically, and upon whose shaft is another and similar wheel having a grooved periphery, in which runs a cord connected with the cross-head of the engine. This cord causes both vertical wheels to rotate when the pisisnot moving in one direction; and when it is moving in the other they are made to rotate in the opposite direction by a spring. The horizontal wheel first mentioned is placed at such a height on the piston rod of the indicator, that when there is an equal pressure at the two ends of the indicator cylinder, and the piston thereof consequently in equilibrium, the horizontal wheel comes exactly against the center of the face of the vertical wheel, and therefore does not revolve; but when it is raised or lowered by motion of the piston rod in either direction, it does revolve, and with a rapidity greater in proportion as it moves in either direction from the center towards the periphery of the vertical wheel. Moreover, as the vertical wheel is reciprocating in its motion, the said horizontal wheel revolves only in one direction. Being furnished with a long pinion, in which runs a spur-wheel connected with a dial and suitable mechanism above, the number of foot-pounds exerted by the engine for every circular inch of piston is pointed out by an index upon the dial.

This indicator can be used for ascertaining the relative amount of work done during the up and down strokes of the engine. The journal referred to, in a separate editorial article upon the subject of steam power meters, remarks that this ingenious apparatus is the only one which satisfactorily fulfills the end of an indicator; and adds:

"We believe that this instrument will be found to render material aid in estimating the economical value of different engines under various circumstances, and it will at once show whether any unusual expenditure of fuel is due to increased work thrown upon the engine, or to carelessness upon the part of the attendants. It will also enable the user of the steam engine to ascertain by mere inspection of the dial the power required to drive different machines, or the efficiency of different lubricators, and it will furnish a variety of similar information, the value of which will be fully recognized by those who have hitherto only been able to obtain it by a considerable expenditure of time and trouble."

American Iron Rails.—The Chicago and Milwaukie rolling mill expects to turn out yearly 20,000 tons of rails equal to those of Bessemer steel as regards the first use, and preferable to them in the fact that they are re-rollable,—which the Bessemer are not. The upper layer of these rails will be hard, being made of one-fourth Lake Superior iron and three-fourths iron from the "Swedes" mine. The lower layer, on the other hand, will be tough and flexible, being made of one-fourth Swedes iron and three-fourths Lake Superior.

Strength of Plates as Diameter of Boiler.—The following is from an article by W. M. Henderson in *Journal Frank. Institute*: A cylinder boiler will be, estimately, just twice as strong, in the longitudinel direction, as in the curvilinear, from a mathematical principle involved in the construction of all cyliadrical vessels, *i. e.*, "the areas of circles are to each other as the squares of their diameters"; the material offering resistance to rupture in the longitudinal direction being the area of the rim section of the shell, as against the pressure exerted on the area of the boiler head. In the curvilinear direction, it is the area of the longitudinal section of the plates, passing through the axis of the boiler, as against the pressure exerted on the area of the enclosed section. From this, it will be seen that boilers having increased dimensions should also have increased strength in the ratio of their diameters, *i. e.*, one boiler twice the diameter of another should have double the thickness of plates, having to resist double the pressure in the curvilinear direction, and the heads being increased in the proportion of four to one, quadruple the pressure in the longitudinal direction."

Effect of an Explosion in Proportion to its Suddenness.—"The startling effects of certain explosions depend on the *shortness of time* required for the action to take place. Chemical calculation show that, for a given result, the expansion produced by the explosion of nitro-glycerine, Giant power, and other fulminates, is no larger than that produced by gunpowder. It is the suddenness of the combustion in the case of these explosives which bursts the gun, the ball not having time to advance a single inch. Compared with this, the burning of gunpowder is a slow process. In the same manner are explained, moreover, the effects of a blow or concussion produced when a heavy body, moving with great velocity, meets with an obstruction. If the obstruction gives way gradually, time is consumed and little effect produced; but if the obstruction is unyielding, so as to stop the motion in a very short space of time, the force of a number of foot-pounds is concentrated in that very short space of time; it thus becomes equivalent to a very great amount of power."—*Dr. Van der Weyde.*

Gun Cotton in Dentistry.—The *Druggists' Circular* says that the collodion made from gun-cotton hardened by evaporation into thin sheets, has been used as a substitute for the objectionable vulcanized rubber. For this purpose different sheets are softened by ether and pressed together in the mold.

One of the objections to the vulcanized rubber is the dark color, which can only be corrected by vermilion, which, however, being a compound of mercury, seriously affects the health of some persons. Sets of teeth made on collodion are much lighter and stronger than on any other material thus far employed for that purpose.

The "Speed-ring" for Small Pulleys. "Belting Facts and Figures," by J. H. Cooper, gives this item:—"In order to obtain a high speed from a driving belt, without the usual arrangement of counter-shaft and belt-pulleys between the main driving shaft and the machine to be driven, and without the disadvantage of passing the belt over a small pulley, a small grooved pulley is keyed on the shaft to which the high velocity is to be communicated, and upon it is placed a loose, inflexible ring, of two or three times the diameter of the pulley, grooved internally to fit it, and turned up smoothly on the outside to receive the driving belt. The belt gives motion to the speed-ring, the inner grooved surface of which communicates a higher speed to the pulley. The speed-ring is held in effective driving contact simply by the tension of the belt. For obtaining increased lateral steadiness at high speed, a double speed-ring may be used, if required. By these arrangements a belt may be passed over a speed-ring of 16 inches diameter and yet communicate the same speed to the shaft as if it were passed over a pulley of only 4 inches diameter."

Method for Increasing the Flow of Wells.—M. Donnet, an engineer of Lyons, proposes to increase the flow of wells by closing the mouth as perfectly as possible, by means of a sheet-iron bell, through the top of which the tube passes which is attached to the pump. When the pump is worked, if more water is withdrawn from the well than naturally flows into it, the water level is lowered, and a diminution of pressure is produced on the surface; this causes an increased supply of water to come in from the springs which feed the well. Indeed, since this increased flow enlarges the channels of supply, the total delivery of the well is permanently increased.

New Method of Suspending a Ship's Compass.—The Earl of Caithness has invented a ball-and-socket arrangement to take the place of the gimbals heretofore generally used. It is said to answer the purpose admirably, and to keep the needle level in the roughest weather.

Scientific Progress.

The Preservation of Entomological Cabinets.

In the August number of the *American Naturalist* Prof. J. L. Leconte gives valuable hints upon this subject, which we condense:—"For the preservation of insects, corrosive sublimate and various preparations of arsenic have been recommended by several high authorities. The former will finally render the pin brittle by the amalgam developed; the latter, when used in a very weak alcoholic solution so as to leave no efflorescence will preserve them well, but is troublesome to apply, as the insects must be thoroughly soaked. Binarseniate of potassa suggested itself; I prepared three boxes of specimens with it. They had a good appearance for some time, but eventually a considerable efflorescence came on the surface. Painting the interior of the boxes with arsenious acid was only partially successful. I then tried the vegetable alkeloids. I soaked specimens in moderately strong alcoholic solutions of strychnia and picrotoxia, dried them and put them into pill boxes with *Trogoderma* larvæ. After some weeks the specimens were partly eaten. The effects of benzine and carbolic acid are only temporary. Packing the collections in chests painted with coal tar, renders the collection practically useless for study on account of the difficulty of access to the boxes.

Surgical art has given us an instrument by which a poisonous liquid can be rapidly and effectively applied to the specimens as they stand in the cabinet boxes. I refer to the *Atomizer*. Opinions may vary as to the poison to be used, but I have found the following formula satisfactory; it produces no efflorescence, even on the most highly polished species, while the odor is quite strong, and persistent enough to destroy any larvæ or eggs that may be in the box:—Saturated alcoholic solution of arsenious acid, eight fluid ounces; strychnine, twelve grains; crystallized carbolic acid, one drachm; mineral naphtha (or heavy benzine), 10 or 12 fluid ounces, and strong alcohol enough to make one quart. Care should be taken to test the naptha on a piece of paper. If it leaves a greasy stain which does not disappear after a few hours, it is not suitable for this purpose."

New Pigments.—Seeo has patented in France divers new pigments based upon his white one of *tungstate of baryta*. The *stannous* tungstate is indigo blue; *ferric* tungstate chamois; *cobaltous* tungstate violet, and blue when calcined; *chromic* tungstate deep green, and *nickelous* tungstate bright green. He claims that these colors are all very stable and present remarkable lustre. Prof. Wurtz, in mentioning this, remarks upon a fine orange pigment prepared by himself some time since, which is a *uranate of baryta*. It is made by boiling carbonate of baryta in a small excess of a solution of the nitrate of uranic oxide. The product is lemon-yellow and has a fair body, but acquires its brilliant orange tint and high body by applying an extremely careful and gentle heat to it in a porcelain crucible, stirring with a glass rod. A trace of organic matter will turn it greenish at this stage, by reduction, and ruin it.

Detection of Alcohol in Small Quantity.—The liquid to be tested is mixed with a portion of platinum-black in a small flask, heated to 124° F., agitated well, and filtered. A few drops of liq. potassæ are added to the filtrate, which is evaporated to dryness over a water-bath. The residue is then mixed with a little arsenious acid, and submitted to heat. If alcohol is present, cacodyl is produced, recognizable by its garlic odor. It is suggested by M. Nickles that propylic alcohol will also yield cacodylic products by this process.—*Jour. de Pharm.*

Guyot's Battery.—M. Guyot has invented a battery, which consists of a porous earthen vessel filled with finely-powdered iron ore, in which is plunged a cylinder of gas-retort charcoal, and an ordinary vessel filled with a saturated solution of common salt, in which is placed a strip of zinc. For the solution may be substituted sand impregnated with it, or salt in crystals.

The Heat Carried by the Gulf Stream.—M. James Croll speculates thus: "The total quantity of water conveyed by the stream is probably equal to that of a stream 50 miles broad and 1000 feet deep, flowing at the rate of four miles an hour. And the mean temperature of the entire mass of moving waters is not under 65° at the moment it leaves the Gulf. I think we are warranted in concluding that the Gulf Stream, before it returns from its northern journey, is on an average cooled down to at least 40°; consequently it losses 25° of heat. Every cubic foot of water, therefore, in this case carries from the tropics for distribution upwards of 1500 units of heat, or 1,158,000 foot-pounds. According to the above estimate of the size and velocity of the stream, 5,575,680,000 cubic feet of water are conveyed from the Gulf per hour, or 133,816,320,000,000 cubic feet daily. Consequently, the total quantity of heat transferred from the equatorial regions per day by the stream amounts to 154,959,300,000,000,000,000 foot-pounds.

Action of Sodium Amalgam on Metallic Salts.—An aqueous solution of ferric chloride, acidulated with hydrochloric acid, when treated with sodium amalgam becomes clearer and clearer, and at last colorless, the whole of the iron being reduced. M. Bunge believes that the reduction of ferric to ferrous chloride, and of the latter to metallic iron proceeds simultaneously.

Chromic chloride, mercuric and gold chlorides, and the chloride, iodide, and bromide of silver, are similarly reduced. In the case of the mercuric chloride calomel is first produced. This reaction may be usefully employed in analysis of the haloid compounds of silver, instead of fusing these compounds off with an alkaline carbonate. It is only necessary to place a small quantity of the powder in a test-glass with a little water, and add thereto some pieces of sodium amalgam, and the chlorine, iodine, or bromine may be detected in the solution in the ordinary way.—*Chem. Centralblatt.*

Freezing by Means of Saline Solutions.—The greater the quantity of any salt which water takes up at a certain given temperature, the greater the decrease of temperature procurable, by means of the solution of that salt. The moment of saturation is the moment of greatest cold. When, therefore, the salt and the water are applied in the proportion wherefrom a saturated solution results, a long period of time elapses before the last portions of the salt are entirely dissolved, and the effect of the warm ambient air to some extent vitiates the proper results of the experiments; the saturated solution should therefore be obtained as rapidly as possible. The sulphocyanide of potassium is the best salt to be adopted for the artificial production of ice; when 500 grammes of this salt are dissolved in 400 cubic centimeters of water, and the mixture stirred with a test-tube filled with water, the latter will be frozen in from two to three minutes.—*Chem. News.*

New Crystalline form of Silica.—De Rath has found in a volcanic porphyry from Cerro San Cristobal, Mexico, a mineral he calls *tridymite*, which is pure silica of the density of what has heretofore been regarded as "amorphous" silica, 2.3; the density of ordinary quartz being 2.6. Tridymite, like quartz itself, is hexagonal, but occurs in very beautiful macles.—*Poggendorf's Annalen.*

In reference to the above, Prof. Wurtz says:—This is a new fact looking to the probable banishment from chemical language of the term amorphous; at least with the sense usually attached to it. The tendency is towards the identification of the condition of solidity with the action of crystallizing forces. Even the colloid and viscoid consistencies or conditions appear to be but transition or medium states between liquidity and solidity."

The Setting of Hydraulic Cements. M. Frémy has shown that when an argillaceous limestone is calcined, at a dull red heat, a partial decomposition of the clay takes place; the silica and alumina, in fact, are separated, and are made free to combine with the lime when the cement is mixed. If the free lime be dissolved out by weak acid, or water, or syrup, the residue of silica and alumina will not set under water, but the cement may be reproduced by the subsequent admission of some lime.

Farming and Gardening.

Varieties in Grain—Interesting if not Novel Deductions.

It is now a very generally acknowledged fact that all cereals are hut cultivated grasses—tbat tbey were not created as wheat, corn, oats, or barley; but that each one has been improved to its present standard of perfection, from a wild and almost worthless grass. There is even now growing on the French and Italian shores of the Mediterranean a neglected wild grass—*Ægilops ovata*, the grains of which, when transplanted to a carefully cultivated garden, will, in a few years, develop into a very excellent wheat. From similar plants, now unknown, have come our barley, corn, etc.

All the different *varieties* of each cereal, no doubt came from a single original stock. None of the cereals will mix, so as to form a new and permanent *species*. Experiment has proven that a sharp limit is fixed to the variation of species. Such variation is powerless to *perpetuate* new organs, even should such, in nature's sports, appear. The idea of species as distinct from *variety*, in both the animal and vegetable kingdom, is based on the faculty of continued reproduction.

The horse is a species comprising many varieties, any two of which, by sexual union, may propagate and produce new varieties, which in turn may propagate. The ass is another species, with similar characteristics. Union between the horse and ase will produce a hybrid; but with that production nature has fixed a limit—an effectual bar against further variation. The mule cannot reproduce itself.

So it is in the vegetable kingdom; we may produce a hybrid by mixing either of the different *species* of grain, as wheat with barley, etc.; but we have only a hybrid, and fail in any attempt to obtain therefrom a new species. Varieties of the same species, however, may be multiplied indefinitely, by various modifications of culture, crossing, etc.

A New and Novel Mode of Producing Varieties.

Tbere is reason to believe that varieties are also sometimes produced by peculiar influences brougbt to bear upon the seeds of various plants. We have "wild goose wheat;" "wild goose rye;" "wild goose plums," etc., so called becanse the seed from which those grains were first produced were taken from the crops of wild geese, and it is inferred that these migrating birds must have obtained such seed in some distant and perhaps unknown locality. We have paid some little attention to this matter, and have come to the conclueion that tbere is nothing in the nature of such cases which would militate against the assumption that such seeds might have been picked up by the birds upon the very farms where tbey have been killed, and even from a portion of the previous year's crop. The change which has produced a "new variety" has been wrought upon the seed, while in the crop of the bird—how, we cannot tell. The seed of the "surprise oat," of which we gave some account a few weeks since, and which was found only upon a single spire, growiug in a large field of common oats ou a farm in Illinois, was no doubt originated in some similar manner—not necessarily in the crop of a goose or any other bird; but the seed from which it grew might have fallen upon some suhstance, organic or otherwise, which produced the modification upon the germ, that finally culminated iu a new variety of oat, which has become famous iu the minds of many for its alleged superiority of excellence.

Again, varieties may he improved, as regards their flavor, size, etc. Bearing upon this, we give the following paragraph which we clip from a late number of the Massachusetts *Plowman*, in wbich paper it appeared editorially:

Seeds Buried in Manure.—Last winter we saved a portion of the seeds of a fine marrow squash for this season's planting, cleaning them thoroughly after the usual method. The remainder of the seeds were thrown into the vault, where they were expected to rot, as well behaved seeds should, under such circumstances, and help in this spring's fertilizing. The material from this vault was composted with loam and applied to a few hills in which were planted early sweet corn, and the seeds of the above-named squashes; they, with most of the seeds which remained in the vault all winter, sprouted, and at the time of this writing, the plants from the last mentioned seeds are most luxuriantly foliaged, having four or five large leaves, while tbe others have but two or at most three.

We regard the above as a very interesting fact in connection with our assumption of a new and hitherto but little observed method of producing new varieties. It is in some degree parallel with the modifications supposed in the crops of birds. May there not be here a new field opened for agricultural experimeut? Who knows what important modification of already valuable products may he brought about by the steeping of the seed, for instance, before planting, in different mineral solutions of a character akin to the soil in which each respectively is found to thrive most luxuriantly.

A New Squash.

A new variety of squasb, known as the "Lungreu squash," was introduced to the Boston public in the spring of 1868, by Messrs. Washburn & Co. of that city, a sample of the seed having been sent to that firm by Dr. Lungren, of Volusia, Florida. Little or nothing appears to be known of its origin. *Tilton's Journal of Horticulture*, for August, gives a very neat pictorial representation of this new vegetable, with the following description:

Planted in good soil, the vine grows vigorously, and attains a length of fifteen feet and upwards. The leaves, which are large and on long foot stalks, are peculiarly, and often even beautifully, variegated with orange or bright yellow; the color being distributed from the base of the leaf, around which it is usually most profuse, in irregular, scrrated bands or stripes, towards the borders.

The fruit is bottle-formed [pear-formed we should judge from the engraving], almost pure white, ten or twelve inches in length, eight inches in diameter at the broadest part, and weighs on the average eight or ten pounds. The neck is quite solid, and four or five inches in thickness. The stem is short and fleshy, and measures nearly the same in diameter as in length. The flesh is pale yellow, or yellowish-white, firm, dry and sweet, mild and pleasant, with little of the strong, unpleasant flavor common to many varieties. The seeds, in size, form and color, appear to be intermediate between those of the Hubbard or autumnal marrow and the winter crook-neck.

The variety is evidently allied to the Puritan, and would unquestionably intermix if cultivated in its vicinity: for it may be worthy of notice that the fruit of the Puritan is occasionally found scarcely distinguishable in size, form, color, or even in quality, from the Lungren, though the plant is never seen with the variegations peculiar to the last named. This plant is fit for use as soon as it attains suitable size, and the plants yield as abundantly as the autumnal marrow or Hubbard varieties. With ordinary care the fruit will keep till midwinter.

Our California gardeners will do well to look after this new vegetable.

San Joaquin Valley.—The farmers in the new settlements of the San Joaquin Valley are said to be doing remarkably well. They are generally in high spirits over present success and hope of future prosperity. From Moore's Landing to San Joaquin City the yield of wheat, it is reported, will average forty bushels to the acre, where the ground has been properly cultivated. In whatever direction one turns in that region he finds the farmers busily engaged in harvesting and thrashing out their grain.

Drying Hay by Steam.

Steam has long been employed in every department of hay culture, from plowing and preparing the soil to making it up and even hauling it to the barn or a market; but it is only recently that we have heard of drying bay by steam. This experiment, it is said, has been tried in England, and so successfully as to leave nothing better to be desired. The grass is carried from the field as fast as mown, and subjected to a blast of hot air by the action of a large fan, worked either by steam or horse-power. The hot air is generated by a coke furnace, and is simply drawn outward by the revolving fan, instead of being allowed to pass up the chimney. In about ten minutes the moist grass is converted into bay of the very best quality. If this invention proves practical, the effect will be to render the farmer independent of the weather, so far as haying is concerned, and consequently save the enormous loss which now results from inferior and damaged hay. It may also he employed to secure a second crop, which at present is generally overlooked, because of the uncertainty of being able to have enough sun to properly dry it.

Californians are not often troubled either by rains or lack of sun to properly dry their hay; but a large portion of hay made here is more or less injured by overdrying. By employing steam as above, the process of hay-making may be brought so directly under the control of the farmer that the exact quantity of heat required can he easily secured; while the "burning" of the hay, and the consequent loss of aroma and engar, is entirely avoided. It is well known that hay cured in the shade is much better than that cured in the hot sun. Steam drying will secure all the advantages of the former process.

Raisins Made upon the Vines.—In the south of Europe and in Egypt, grapes are allowed to dry and ripe upon the vine so as to form raisins. The sweet fleshy grapes which grow upon the sunny, sheltered slopes of hills are preferred. When the fruit is ripe the grapes are thinned; and the vine is stripped of its leaves. The sun then completes the saccharification, and drives off the superfluous water. When the bunches are plucked, they are cleaned, dipped for a few seconds in boiling lye of wood ashes and quicklime; the wrinkled fruit is then drained and dried, and exposed to the sun upon hurdles for fourteen or fifteen days. The finest sun raisins are the plumpest bunches left to ripen upon the vine after their stalks have been cut half through. An inferior kind of raisins is prepared by drying in an oven.

Sherman Island.—Reports from this recently reclaimed island still continue favorable. All kinds of vegetables are growing wonderfully. The soil looks dry upon the top; but the roots readily go down to everlasting moisture. It is suggested that this locality is most admirably calculated for the dairy business, as the grass keeps green the year round. San Franciscans would doubtless readily patronize such an establishment, as good grass-fed milk is infinitely better than slop-milk or that produced from brewer's grain. A steamer will soon be needed for the accommodation of the business with this island. The George Roberts Company has sent East for a steam ditcher, which, it is said, will greatly reduce the expense of reclaiming their island.

Raising Gold Fish.—These fish are extensively raised in many places at the East, and persons who are engaged in that business are often annoyed because they do not increase as rapidly as desired. It sometimes happens that the ponds are almost if not quite depopulated. This is said to be very frequently owing to the ponds being infested with leeches, which are very destructive to this fish. To obviate this difficulty it is recommended that the ponds should he run dry, all the mud and decayed vegetable matter carefully removed, and the bottom and sides of the pond lined with a good covering of pebbles or coarse, clean gravel.

Great Loss of Cattle.—The San Diego *Union* states that out of 55,000 head of cattle that started from Texas during the past year for California, not over 5,000 reached the State.

Interesting Fact in Tree-Growing.—It often occurs that a graft is put into a stock which does not grow as rapidly as the graft. The consequence is an unsightly bulge or swelling at the junction of the graft. Charles Downing states as a remarkable fact, that be once witnessed the removal of such a protuberance in the following manner. The graft was a Buerre pear, which had largely outgrown in thickness its stock. The smaller portion was enclosed in straw about two inches thick, and at the end of two seasons it was found on removing the straw, that the contracted, or hitherfore smaller stem had swollen to tbe full size of the graft above, presenting but a slight indication of the point of union between graft and stock.

Tbe device, we believe, is not entirely new, although not very generally known. The item will at all events be of interest to many who have trees with contracted stems, that give evidence of some natural want of affinity with the graft. Moss has been used as a material for wrapping, and is probably better than straw.

Grapes without Irrigation.—Mr. H. L. Hatch, at Indian Springs, Nevada county, has a vineyard of 1,200 vines—foreign and domestic varieties—which, now in their third year of growth, are loaded down with fruit, and yet have never been irrigated. Mr. Hatch started out with the determination to show that the grape can he cultivated in the foot-hills without irrigation.

Driving a Young Horse.—In teaching a young horse to drive well do not hurry to see how fast he can trot. Keep each pace clear and distinct from the other, that is, in walking make him walk and do not allow him to trot. While trotting, he equally careful that he keeps steady at his pace, and do not allow him to slack into a walk. The reins while driving should be kept snug; and when pushed to the top of his speed keep him well in hand that be may learn to bear well upon the hit, so that when going at a high rate of speed be can he held at his pace, but do not allow him to pull too hard, for it is not only unpleasant, but makes it often difficult to manage him.

Corn for Cows.—A correspondent of the Canada *Farmer* who sold the milk from twenty-six cows to a cheese factory last year, commenced feeding corn on the last of July from an acre planted in drills. In September he omitted the corn for four days, and the result was a diminution of fifty-two pounds of milk a day. The corn feeding was again resumed, and in four days the cows gave their customary quantity of milk.

The Pecan Nut, which is extensively cultivated in the Southern and Southwestern States, will not bear fruit when planted north of Maryland, although it flourishes as a shade tree as far north as Central New York. There is said to be a beautiful tree of this variety growing in a garden at Newburg, N, Y., but it has never produced a nut.

Steam Plows.—In the proceedings of tbe New York Agricultural Society, it is stated that there are now three thousand steam plows in use in Great Britain on the Fowler plan, and four hundred in Egypt, on the level plains near the Nile. Our farmers will see from this what changes are taking place in the mode of farming in the old country.

The Eastern Shipment of Fruit promise to give quite a new impulse to the general fruit business of the State. The success attending the preliminary experiments of this season are most promising for the future of that industry, and will result in a rapid increase in the number of our fruit trees and the extent of our orchards, particularly along the line of the overland Railroad.

Santa Barbara—The Wool Clip.—It is said that the wool clip of this county will reach 1,200,000 pounds, worth at the current price $240,000. The total wool crop of the State last year was 14,802,000 pounds—7,400 tons, and nearly 1,000 tons more than the product of any other State in the Union.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, August 28, 1869.

Financial.

A very remarkable change has come over our local money market since our last issue. The Treasury Department, in response to the request of our bankers, has permitted the transfers of gold from the Sub-Treasury in this city, against gold deposits in New York, to the amount of several millions, affording much relief to the mercantile community and enabling grain dealers to move the heavy crop awaiting a market. We also learn that the Directors of the London and San Francisco Bank have determined to increase its capital to $3,500,000, an addition of $2,500,000, which will prove of material aid to various interests. Telegrams received from New York state that $1,500,000 had left that city for San Francisco, overland, and as this is the amount required for immediate use by the London and San Francisco Bank, it is probable that the telegram refers to it and not to the transfers authorized by the Treasury. We have been long surprised at the sluggishness of British capital to seek investment in California securities. The telegraph, cable, and railroad have brought us so near to each other that London and San Francisco are as close neighbors as London and Edinburgh were thirty years ago. This is a new State, with undeveloped resources of the most varied, extensive, and valuable character. It presents inducements not surpassed by any other on the globe; our interest rates are three or four times higher than those of England; our currency is gold and silver, and our future commercial, agricultural, mining, and manufacturing greatness unquestionable. The banks of France and England now hold $350,000,000 of specie lying idle and rusting for want of use. The interest on this amount at English and Continental rates—three per cent. per annum—would be $10,500,000, and at ten per cent., the lowest California rate, would be $35,000,000. Loans are made on European securities of far inferior character to those proffered by the Pacific Coast of the United States, and it is most gratifying to know that the manner in which British capital has been handled by its accredited managers in this country has resulted in developing increased confidence in California investments. The ice of English indisposition has been fairly broken and a regular thaw is likely to succeed, opening fresh springs full of nourishment to all interests.

The deposits in our savings banks are regular and increasing in volume, demonstrating the easy financial condition of our laboring classes and the liberal remuneration paid for their services. Nearly $24,000,000, gold, is booked in our local savings banks to the credit of about 40,000 depositors of that class. In this manner the little drillets of industry are collected in one mighty stream, which is applied to turning the colossal wheels of business enterprise and the development of our many valuable resources. But for these banks, $24,000,000 would now be either withheld from use or so subdivided as to be of scarcely any benefit to the community, while the owners would be receiving little or no benefit from their savings. As it is, the amount of $2,880,000 per annum is now shared among them in the shape of interest paid by borrowers. Although money is more plentiful and the stress has been removed, probably never to be renewed from like causes, rates in bank have not been diminished, and are quotable at 1@1½ per cent. per month. Bullion is in short supply with a rather active, but not pressing demand. Gold bars range from 850@860; silver bars from par to ½ per cent. discount; currency bills on. Atlantic cities pay 31@32 per cent. premium on gold; coin drafts, payable at sight, are negotiated at ⅜@1 per cent. premium; telegraphic transfers, 1@1¼ per cent. premium; sterling exchange, 483¼d; commercial exchange, 49¼@49½d; Mexican dollars, 6@7 per cent. premium, nominal; gold, in New York, August 26th, 133½; legal tenders, in San Francisco, 74½@75.

City Stocks.

During the past week we note sales of Spring Valley Water Co. stock at $60 50 per share, and Central (street) Railroad at $56. A few shares of California Steam Nav. Co. were sold at 52@53 per cent.—The North Beach and Mission Railroad Co. elected the following Directors for the ensuing year: J. T. Boyd, E. F. Northam, Henry A. Lyons, John S. Hager, Michael Reese, Jerome Lincoln, Alpheus Bull, and Michael Skelly.—At the close, San Francisco Gas realized $84@84 50 per share.

The returns of our local insurance companies to the Internal Revenue Department for the month of July and previously this year have been as follows, upon a currency basis of 74 cents on the dollar for the month of January, 77¾ cents for February and March, 75½ cents for April, 73¾ cents for May, 74½ cents for June and July:

	July.	Previously this year.	Total.
Pacific	$124,606	$616,281	$741,217
Union	39,809	257,982	297,791
Fireman's Fund	37,804	199,556	237,360
California	9,092	61,889	71,581
Merchants' Mutual Marine	20,874	158,766	179,640
Occidental	26,787	136,012	162,799
Home Mutual	15,985	82,250	98,235
Peoples'	24,381	97,951	122,332
Total	$300,268	$1,610,687	$1,910,955
Same time in 1868	198,393	993,655	1,192,048
Increase in 1869	$101,875	$617,032	$718,907

The above statement shows an increase of $10,786 over the receipts in June. The receipts of the several companies in July as compared with June show the following difference:

	Increase.	Decrease.
Pacific	$1,312	.....
Union	7,585	.....
Fireman's Fund	1,643	.....
California	462	.....
Merchants' Mutual Marine	.....	6,388
Occidental	1,582	.....
Home Mutual	532	.....
People's	4,026	.....

The receipts of the city railroads for the month of July and previously this year were as follows:

	July.	Previously this year.	Total.
Omnibus	$26,130	$145,939	$172,069
North Beach & Mission	26,011	140,313	166,324
Central	18,906	96,980	115,886
Front Street, Mission & Ocean	10,727	54,201	65,028
Market Street	12,562	69,977	82,539
Potrero and Bay View	3,745	17,629	21,374
City	3,308	.....	3,308
Totals	$101,409	$525,220	$626,729
Same time in 1868	92,418	445,775	538,193
Increase in 1869	$8,991	$59,545	$88,536

As compared with the total receipts in June, we find an increase of $9,754. The receipts of July as against June show the following difference:

	Increase.	Decrease.
Omnibus	$ 572	.....
North Beach and Mission	2,520	.....
Central	1,813	.....
Front Street, Mission and Ocean	1,112	.....
Market Street	386	.....
Potrero and Bay View	43	.....

Mining Share Market.

Moderate activity pervaded the mining share market during the period under review. The general outlook of the market, so far as enhanced rates are concerned, is somewhat less favorable than at the opening of the week; prices since then showing a considerable recession throughout the entire list usually brought to the notice of dealers. With regard to the modes by which the immense accumulations of low-grade ores at the different mines on the Comstock Lode will be made available for profitable reduction, we extract the following from a letter to the *Daily Herald*:

The railroad between here and Carson, misnamed the Virginia and Truckee Railroad, is not progressing very fast in construction at the present time. Considerable grading has yet to be done, but as the iron for the track will not arrive for six or eight weeks yet, Sharon & Co. have concluded not to push things too fast, but to wait awhile, and so save the use of the money. They have taken off the hands employed on the last tunnel near Virginia, which can be finished in a week, and during the next three or four days will discharge 600 Chinamen and over 200 white men. It will not require a very large force to complete the grading.

Adolph Sutro, the famous projector of a certain tunnel between Carson River and the Comstock ledge, is here. He is trying to put his grand project through now, by means of small subscriptions from miners, or anybody else who will take small or large amounts of the stock. That is his best chance of success now, as for interested reasons the capitalists are averse to investing in it, regarding it with an unjustifiable degree of jealousy. This tunnel certainly is a very important work, and would be a great advantage to the country. Through it to Carson River is less than four miles, straight track; and the tunnel once completed, cars could be run backward and forward regularly, regardless of snow, rain, or any other vagary of the elements, at all seasons of the year. It would also tap the Comstock mine hundreds of feet deeper than the present lowest workings, and afford the best possible drainage. Sutro has fought against all manner of discouragements for a long time, but that tunnel will eventually be run, whether Sutro has anything to do with it or not.

HALE & NORCROSS—exhibited considerable activity toward the close, but transactions show a recession in prices. During the week ending August 21st, the upper mine of this claim yielded 302½ tons of ore, and the lower 456½, making a total of 819½ tons. At the above date, 772½ tons were on the dump. On the afternoon of the 22d inst. they finished retimbering the shaft between the fourth and fifth levels, and immediately commenced hoisting ore from the fifth level. They found the drifts and tunnels in perfect order, and recommenced breasting in the ore. The drift going west from the fifth floor of this level has not reached the west vein. On the 400-level they are continuing to sink the winze; the ore is three feet wide, averaging $60 per ton by assay for the week.

CHOLLAR-POTOSI—was in the market to a considerable extent, at quite uniform rates. For the week ending August 20th they mined 1,675 tons of ore. This amount came from the following localities: Blue Wing, 1,045; New Tunnel, 300; and Grass Valley station, 330 tons. The stopes in the Blue Wing station continue to look promising. The faces are in as good a condition as they were thirty days ago. The New Tunnel ore locality shows no change for the better.

GOULD & CURRY—sold to a moderate extent. During the week ending August 23d, the upper chambers of this mine produced 246¾ tons of ore. At the seventh level very little work has yet been done, owing to the hrcakage in pump gear. The drift running north-east is in twenty four feet, the material passed through consisting of clay and porphyry.—The OPHIR drift was in 549 feet on the 24th inst.—BULLION levied an assessment of $10 per share on the 21st inst.

YELLOW JACKET—exhibits a considerable decline, under rather heavy sales. A correspondent says: "The north shaft of the Yellow Jacket will be rid of water, mud, etc., in about two weeks longer, when an incline will be opened from the 700 to the 800-level, and the extraction of ore will be commenced. The south part of the mine is yielding as usual. The present assessment of $10 per share became delinquent on the 18th inst. I hear it hinted that another similar assessment will be levied as soon as it can be legally done, as the expenses have been in excess of the receipts for some time past, and still are so. That probably will be the last assessment, for the good ore in the north mine will make things all right as soon as it can be got at advantageously."

PAMPHLETEERING.—It is said of the circulation of the pamphlet edition of Mr. Sumner's late speech on the Alabama question, that 165 copies were sent to the American press, 20 to the English press, and 310 were sold—that's, all. Pamphleteering in this age of newspapers don't pay. A more mortifying remark was probably never made than that which Fontenelle made to a man who, having need of his assistance, came to him to apologize for having, at a previous time, written a pamphlet against him. "Sir," said the philosopher, "this is the first time I ever heard of it."

Weekly Shareholders' Directory, for Meetings, Assessments and Dividends.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

20 " "	37 78	30 " "	66 66
21 " "	40 67	31 " "	69 55

These prices, we believe, will be found substantially correct, and can be realized at this date.

AN ARTIFICIAL INTERIOR SEA.—M. de Lesseps, the engineer of the Suez Canal, has come to the conclusion that the Desert of Sahara is the bed of an old sea, and is considerably lower than the Red Sea. He is satisfied that a canal of seventy-five miles would re-fill it, and put the two in communication, making intercourse with Central Africa an easy matter.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Leviathan.—*Miner*, Aug. 14th: We learn that the Leviathan, which started up a few weeks since with such flattering prospects of continuous work, is to be suspended again to-day. False representations as to the cost of delivering the ore in San Francisco, and other matters, made by the London agent, which the owner here cannot see his way clear to back up, it is said causes the let up.

Globe.—Thursday morning a cave occurred in the Globe tunnel. It is thought the true casing of the Hercules lode is cut.

M. C. Mill.—A series of experiments are about to be made in this mill which we think will determine how practically to work the ores of Alpine to profit.

Pennsylvania.—*Chronicle*, 14th: The mine is being timbered. The south drift is in 120 feet, and the ore taken out looks well. The Company intend to raise on the ledge and if it prospects well negotiations for a mill will be closed.

On Dit.—Rumor says that one or two prominent claims in Silver Mountain District, have been purchased by a company of English capitalists. This company have a paid-up working capital of $300,000, and it is their intention to start up work so soon as the Resident Manager arrives from England—about the 20th of September.

The Mountain.—The work in this tunnel progresses finely. The rock is getting softer, and on Thursday the tunnel cut a feeder of fine looking quartz. The ledge is liable to be struck at any moment.

BUTTE COUNTY.

Union Ranch.—Correspondence of Oroville *Record*, Aug. 21st: "Mr. Derrick has got the quartz mill at Oregon City in full blast. Report says he is crushing very good rock and the batteries look well; * * I took a stroll down to the North Fork, on Sunday, and found Johnson & Hartwell almost ready to turn the water through their flume. The flume is almost seven hundred feet long, 35 feet wide at the head, and 33 feet at the foot, with six sides. With the low stage of water, they think the water will only be about three feet deep in it, thus leaving a large portion for a freshet.

CALAVERAS COUNTY.

New Diggings.—*Chronicle*, 21st: We are informed that a French Company who have been prospecting Boston Hill have discovered a lead of rich gravel.

NEVADA COUNTY.

Weekly Mining Review.—Grass Valley *National*, Aug. 22d: The Idaho company in the first, second and fourth levels, is taking out ore, and is opening the fifth level both to the east and the west. The rock in all the levels is looking well.

The North Star mine is again under full headway. About 120 men are at work. The mill is running regularly. The rock which is coming from the 800 foot level shows rich in free gold as well as in sulphurets.

The Wisconsin company is going down to the 400 foot level. The ledge is increasing in size. Rock is being constantly taken out of the 300 foot level. The frame for the new mill building is being erected.

Union Hill company is taking rich rock from the first and second levels. This mine is more than paying its way.

The Dromedary mine is being worked steadily. On last Friday a clean up gave over $30 per ton.

The Old Rush Mill has been sold to a company of Frenchmen who removed the machinery, and proceeded to wash out the foundations of the batteries. This paid well, showing that all the gold has not been saved. A clean up showed $3,000 to the French company, and more ground yet to be washed.

The Empire mine is being worked by a full complement of hands. Rock is coming out from the eighth and ninth levels, and Capt. Lee is sinking for the tenth, which will be the 1,000th foot level. The ore in the ninth is looking better than at any previous time. The mill of the Empire is running night and day with thirty stamps.

The Hope Gravel company's drift tapped a large body of water. Yesterday the water was entirely pumped out, and this week the company will commence to wash gravel.

The McClellan started up their steam hoisting and pumping works yesterday. Their ledge is a large one, showing plenty of mineral, which assays well, though no gold is to be seen in the rock as yet.

Union Hill.—Work on the Lucky mine will soon be resumed. The Union Hill mine is in successful operation. They are running twenty stamps, and in the last ten days' run have cleaned up about $15,000.

Ben Franklin Ledge.—*National*, Aug. 21st: The Washington mine is yielding $50-rock. The Ben Franklin milled last week 96 loads of rock which paid over $50 a load; this gave the men working on shares, $600 a man for two month's work. The Dresskel mine continues to maintain the even tenor of its way, the rock paying all the way from $20 to $50 a load. The ledge in the Small Hope is improving as it goes north toward the Dresskel, which which is working within about 100 feet of the Small Hope line.

Quartz Mill Burned.—*Gazette*, 19th: Mr. Allen, who came down yesterday from Eureka, informs us that the Commercial quartz mill at that place, owned by Messrs. Valentine & Co., of San Francisco, was destroyed by fire on Monday evening. Loss is estimated at $10,000. It is supposed to have been the work of an incendiary.

Omega.—20th: Placer mining is almost entirely suspended for lack of water. Drifting and putting into shape for next season is about the only work being done. The Salathiel quartz ledge and mill on Diamond creek, is kept running only half the time. The ledge in the tunnel varies from two to five feet in width, and pays uniformly well.

Suspended.—21st: The Pittsburg mine suspended operations yesterday and most of the men employed were discharged.

Important Strike.—We understand that the company working the Kansas claim, on the ridge a mile and a half above Nevada, struck rich gravel a day or two since. The company have been several months sinking shafts and running drifts to find the continuation of the Nebraska lead, and have at length succeeded. The work has been suspended for the present, with the view of putting up better machinery.

You Bet.—*Transcript*, 18th: The mining prospect is encouraging. Neece & West are preparing their claims for hydraulicing. They have extensive banks, 170 feet deep, and containing first-rate gravel. Last week they discharged a blast of 280 kegs of powder, and were 27 hours in getting in the charge. The blast was exploded by a galvanic battery. There are ten men employed. Conway & Cook have a contract for running a branch tunnel 225 feet, to bring the main tunnel under the banks, and enable them to drain the claims and work through the tunnel. When completed, the entire tunnel will be 900 feet long.

Meadow Lake.—Since the success of the Burns' process is established, Meadow Lake mining district is looking up. Burns & Blood have the old Winton mill. Their roasting furnace was started up on Monday week, and thus far its workings have been highly satisfactory. The process consists of first roasting the rock, and then subjecting it to what is called a chemical bath, the solution being that discovered by Mrs. Burns. The rock being thrown into the solution after roasting, remains until cooled, when it is worked by the ordinary mill process. None of the rock has yet been worked in the mill, but some tested in a mortar was found to amalgamate readily.

Harrigan, Doling & Co. are putting up a furnace for roasting the ore. A small furnace has already been tested and worked well. The rock from their mine will be worked in the Monitor mill, and the same solution will be used as by Burns & Blood.

Culbertson & Keeney have secured the Enterprise mill, and will start crushing in a day or two on rock from Red Mountain.

The Grant Co. recently shipped 20 tons of rock to Grass Valley to be worked, and 500 pounds from the Empire mine has been sent to San Francisco to be assayed.

PLACER COUNTY.

Rich Ore.—*Herald*, 21st: W. G. Green left in this office, last Saturday a specimen of gold bearing quartz, thickly studded with pure bright quartz. It came from his mine, a mile or two west of town.

PLUMAS COUNTY.

Twelve Mile Bar.—Correspondence of Quincy *National*, Aug. 14: Mr. Ward has completed his flume, and started his pumps last week; Ward & Brown, near Hardsock Point, have their flume nearly completed; will be washing in a few days. Cole, Wright & Co. have reached the bank channel in 12-Mile Bar Hill, for which they have been running for the past four or five months. Sheizer & Co. continue piping and have excellent prospects. Johnson, Mercer & Co. had nearly completed their wing-dam when a portion of the wing gave way. This will set them back about a month. But they will be taking out pay by the first of September, and do well yet. Halstead & Co. continue piping; have good prospects. There is a number of men prospecting on Rich Gulch, and as soon as they are able to get water they will do well.

SIERRA COUNTY.

Big Chunk.—Downieville *Messenger*, Aug. 21st: A piece of gold weighing 106 pounds was taken from a claim near the Buttes on Wednesday last. The whole amount taken out that day was $50,000. This is the largest piece ever found in this county.

Chispa.—We heard the other day that some Celestial miners on the South Side had picked up a nugget weighing nine pounds, valued at over $1,800. They cut it up into small pieces before selling it.

Arizona.

Sterling.—Prescott *Miner*, Aug. 7th: Rock is now being hauled from the mine to the mill, and it will not be long before crushing will be commenced. The ledge is said to be looking well.

Arizona City.—Correspondence of the above: Dr. Phillips is working the Eureka mine.....The Gila mining Co's mill is running. To judge by the rock I think it pays well. ...Large shipments of ore are being made from Hamilton & Butterfield's mines at Castle Dome.

Colorado.

Mining Items.—Central City *Herald*, Aug. 18th: Bucklin & Babcock, on the Fairfield lode, Russell Gulch, at a depth of 87 feet, have a solid vein of copper and iron pyrites two feet thick, which is very rich.....Mr. Beach has taken two batteries out of the Briggs mill with a view to putting in the Wilson steam stamp-mill..... The Quartz Hill tunnel has been carried into the mountain 430 feet. Water runs freely from the tunnel. The indications of pay improve as the work advances.....Ex-Mayor Slaughter has struck a fine lode in Virginia Cañon, which yields ore worth $300 per ton in silver. He is going to make a test run at Stewart's this week..... A 12-stamp mill is nearly ready to start at the head of Peck Gulch. It will be supplied with ore from the Man and Surprise lodes.....J. V. Kimber is successfully running his 24-stamp mill at the foot of Chase Gulch, night and day, on ore from the Bates & Hunter and California (Stocker & Stanley) lodes. J. B. Tomlinson is running the Hollman (12-stamp) mill at Black Hawk, with excellent results, principally on Bob-Tail ore.....We were shown a beautiful retort weighing 159 ounces, the result of five days' milling at the Smith & Parmalee. Stalker & Standley sold six bars of gold to Warren, Hussey & Co., for $4,500; the product of one week's run from the California mine, Nevada.

North Clear Creek.—Water is low. New York mill running only 20 stamps on California ore. Woodbury & Co's 12 stamps on Ophir and Gaston. Consolidated Gregory has resumed work.

Two tons of ore from the Seaton lode, Clear Creek County, treated by Prof. Hill, last week, yielded 166 ounces of silver per ton.

Pleasant View Mine.—The shaft is now 150 feet deep. The vein in the east drift is fully eight feet wide. The smallest return yet made for a lot of 25 cords of ore, was equal to 100 per cent. net profit.

Clear Creek.—The vein of ore in the Baltimore tunnel is from four to six inches wide, and assays $350 per ton. It was struck at a depth of 150 feet from the surface.

The shaft on the California lode, Sherman Mountain, is now 35 feet deep. The vein is eight inches wide and very rich.

The Baker Co. will start three Bruckner cylinders in two weeks. Their mill is one of the finest in the country.

Hnepeden & Co. are putting up another cylinder. They have been running on Equator ore for a few weeks. The Equator are putting up an engine for hoisting ore.

Prof. Dibbin will have his mill ready to run in two weeks. He is going to run the ore raw in pans. He will put up a Bruckner cylinder also.

Terrible.—The shaft is 185 feet deep. The tunnel, 7x7 feet, is being driven with the Burleigh drill nine feet per week.

Trail Creek.—*Register*, Aug. 19th: Bennett's little steam stamper is at work periodically. We understand that they are very well satisfied with it so far. Cramer & Chavanne's arastra is grinding away steadily on Coyote rock, with very flattering results. Dr. Holland also has two arastras in the Halo mill, one of which is running on Coyote rock, and the other will be started in a few days. Judge Colvin has his mill building nearly completed, and is setting up his engine and boilers. He also has a gang of miners at work taking out ore.

Peck Gulch.—Mr. Irwin has struck an extension of Dr. Mann's lode and has a strong vein that prospects largely.

Virginia Canyon.—Two tons of ore from the Seaton lode, Virginia Cañon—one ton taken from the dump, and one ton from one of the upper levels—was recently reduced at Prof. Hill's works, with a result of 166 ounces silver per ton.

Ward District.—T. J. Graham came over yesterday, with 20 ounces of retort from the Columbia lode. He says that Arnot & Co. are at work on the Buckhorn lode, at Jamestown, and taking out ore of a better quality than usual. Several arastras are running surface ores from various lodes with good results. Reports from the Gold Hill mines continue encouraging. Bottleson's mill is working steadily. Parties are working the Williams' lode with encouraging results.

Mill City.—Business reported brisk owing to recent discovery of rich silver lodes. Two reverberatory furnaces have been put up in the old McIntyre mill, also one Hagan furnace for gold ores. Hawkins & Dodge have 20 or 30 tons of first-class ore out. Cook & Carpenter have the same quantity out at the Capital shaft, also very rich in silver.

Prize and Gunnell Hills.—Three different parties are at work on the Jones' lode. Ore looks well. Lowe, on the Prize, has 30 tons of smelting ore out. Gilbert's mine turns out two cords per day of stamp rock and considerable ore. Surface rock from the Gunnell looks well.

South Park.—Cor. Denver *News*, Aug. 18th: This year we have double the number of men employed in our placer mines that we ever have had during any previous season, and they are taking out more money than ever before. There is not a quartz mill in operation in Park County, yet there is no mining district in the Territory that has more or richer lodes. Unfortunately, however, they are controlled by Eastern men who are playing a "freeze out" game.

Idaho.

The Bedrock Shaft.—Idaho City *World*, Aug. 19th: Work is still vigorously prosecuted. On Sunday a vein of water was struck, which bothered the men in the shaft for a day, but they finally got the mastery of it, and on Tuesday night they struck upon fine white sand. All through this small pebbles of quartz are found, and the miners accept these as good indications that they will strike a rich-paying stratum of hard gravel. The shaft was sunk to nearly 90 feet depth up to last evening.

Alturas County.—The Casco mine at Red Warrior has yielded better than ever, during the past month. At a depth of less than 200 feet a well-defined ledge was struck which averages two feet width, and yields free gold, with a slight dash of silver in it. This ore is readily reduced in the mill without the aid of pans. A ten-stamp mill is employed, and a force of 20 men run the mine and mill.

At present very little is going on in the Yuba district. The Monarch Co. have bought the old Farnham mill.

At Rocky Bar, arastras are crushing ores from the Idaho and Confederate Star ledges, and good products are obtained. From three tons of Idaho rock the yield was $3,500.

Ida Elmore.—Silver City *Wave*, Aug. 17th: Parties who visited the Ida Elmore on Sunday last assure us that the dump is showing the richest ore ever taken from the mine.. .Sam. Neely has given us a specimen of Baxter ore, showing ruby silver in every solid part so red and dense as to stain through a coating of chloride on one side. ....The Sullivan boys are still working on their ditch, taking water from the head of Jordan Creek, Sawpit and Long gulches over into Jacob's Gulch. They have a tunnel on the divide through which the water is conducted.....The Miner mill started up promptly on Red Jacket ore on Wednesday morning and will probably be kept busy the balance of the season..... The Potosi mine is showing some elegant rock. We saw a piece a day or two since so full of free gold in strings or wires as to hold the rock together after it was broken with a hammer.....Red Jacket intends to commence sending ore to the Miner mill. The shaft is down 81 feet and 60 feet of drifts driven—thirty each way. ....The Cosmos mill cleaned up on Saturday after two or three weeks' run on Silver Cord ore. The mill will now be idle for a couple of weeks to allow the miners to get ahead a little.

Wagontown diggings are quite an attraction. Locations have been made from a

shortdistance below Wagontown down the creek seme feur miles. Hutchiags, Sheehan & Co., Skinaer & Co., Thompson & Ce., P. J. Reagan & Co., aad some 20 or 30 others, have made locations that are believed to be good for more than wages, say eeven to ten dollars. Water is net very plentiful just now, though a mederate elaice head is running.

Montana.

ARGENTA.—Virginia City *Republican*, Aug. 11th:—Griffith and Hanson have opened their coal mine, three miles this side of Argenta, to the depth of forty feet. The veiu is six feet in width, bituminous, aad of exeellent quality. The mino could not be more fortunately located fer the furnaeces of Argenta. Tho furnace of Cummings & Vealo, and that of Tootle, Leach & Co. are in full blast, with plenty of rich ore to keep them ia constant operatien.

BANNACK.—The Bannack Ditch Company have taken ont of their placers one thousand ounces of gold in the last thirty days. The geld is of a very superior quality, and sold readily for $24. per ounce. The company employs thirty hands. All the other places about Banuack are being worked with success. Brown, Bray and others have completed a new ditch, for miniag the placer opposite the town. They are about to make extensivo excavations ia the bed of the creek.

WILLIAM'S GULCH.—In the Stiles Extension Lode, No. 2, from two pounds and a half of rock, by cammoa pan proeess, the yield was forty-one cents. The rock is little better than the average of the lede. The crevice is from ten to sixteen inches wide and increasing. The ore was taken frem a depth of seven feet.

UNION PACIFIC LODE.—It is in Brown's gulch, three miles from Virginia; has a crevico of eight feet in width, and has been excavated to the depth of twenty-soven feet. The last run made of the ore yielded $600 to the ton. The ore is principally silver.

SOAP GULCH.—This is 55 miles from us toward Deer Lodge City. Splendid prospects havo been obtained from bars on the west side of the gulch, about a mile above its mouth, as high in somo instanees as a dollar to the pan. A bed-rock flume is being constructed near the center where the ground is very deep, tho result of which will settle the fate of the new diggings.

Nevada.

COPE DISTRICT.

SPECIMENS.—Elko *Independent*, Aug. 21st: Geo. Cowles presented us yesterday two beautiful specimens of gold and silver bearing quartz that were washed out of the placer diggings at Cope. The sharp edges show that the lode from which they came caanot be far away; ia fact, Mr. Cowles says the miners think it is already discovered. Every mine upon which work is being done is turniag out splendid ore.

A MILL FOR COPE.—Uncle John Atchison and Col. Drew have gone to San Francisco to procure the necessary machinery for a tea-stamp mill.

ELKO COAL MINES.—The Coal Mining Company, whose claims are located south of the river, have beeu for some time engaged in sinking an air shaft. They intend to resume operations on tho veiu with an iucreased force.

COPE.—Territorial *Enterprise*, Aug. 21st: Pat Clogan, an experienced prospector, arrived in this city a day or two siace, direct from Cope. He says there are about three hundred meu in the district. The assays run from $400 to $700, principally in silver. We were shown ore from the Virginia, Tiger and Keystone, which assays as above. They expect to have at least one mill in operation in the district beforo winter. There are supposed to be good surface diggings, as prospects panning from a color up to twenty-five eents per pan have been obtained in several dry gulches. The ceuntry will be a pleasant one iu which to winter. Little snow or cold weather is anticipated by the miners, nevertheless they are erecting comfortable cabins.

The Silver City *Wave* of the 17th, has the following item direct from Mountain City:—The Mill Creek ditch will he completed this fall, but there will be no water before next spring. The placer mines will pay from five to ten dollars per day and are quite extensive. Flonr is $12 per 100; lumber, $150 per M. A new quartz lodo has been discovered across the river from Mountain City, called the Mountain Maid, said to be richer and more extensive than any former location in the district.

REESE RIVER.

LANDER HILL.—*Reveille*, Aug. 21st: Everything is lively. The Plymouth shaft has started up, and will not stop until it has beeu sunk 250 feet. Most of the small companies of miners who had rushed to "the poor man's paradise" have returned and are investing a little mere muscle in tho old hill. One who returned from W. P. not long since in a most dilapidated conditiou has already realized over two thousand dollars from one erushing at the Manhattan mill. Another has cleared five thousand during the season, showing that we have some chlorides here as well as elsewhere.

MINERAL HILL.—*Reveille*, 21st: The work done so far is highly encouraging, and the miners more hopeful than ever. Some forty tons of ore is on the way here to be milled.

The Elko *Independent* has seen some very rich rock from Mineral Hill District. The New Jersey Compaay now have six men at work. A large lot of ore is being sacked and will be forwarded to San Francisco this week. The owners say that this rock is as rich as any that ever came out of White Pine. A mill is to be built immediately.

HOT CREEK.—Correspondence of the *Inland Empire*, Aug. 18th: "There are several of us who have net yet deserted the old camp. These hills are full of the precious metals, and it only requires coined money to bring forth the crude article in vast quantities. I will not go into the details which have been se often given; but I will say that we have lots of developed and undeveloped mines—ledges as wide as true fissure veins ever are, bearing large quantities of ore that will mill from $75 to $300 per toa. * * The Silver Mountain Co. are prosecuting work oa their claims. Mr. Crosby, their Superintendent, is going down, piling up his ores at one side, and when he arrives at the right depth, his mines will be in good shape, and the mill—which will undoubtedly be built—will have a coastant supply of ores, and then will Hot Creek see palmy days."

WASHOE.

[In the Stock Circular, in another portiou of this paper will be found late mining news from this district.]

YELLOW JACKET.—*Enterprise*, 15th: The water is nearly out of the north shaft, and it will take a couple of weeks to get out the 40 feet of mud and debris at the bottom. Considerable repairing has to be done to the timbering. The new building is completed. The Yolo tunnel yields 50 tons of ore per day. The south mine yields 150 tons per day, from the two lower levels. A winze connection from the 900-foot level to the 800-foot level of the Kentuck will be completed to-day, giving an increased circulation of air in both mines. The 700-ft. level is still tightly closed, as from the gas leaking out it is fully evident that the fire still burns there and in the two mines eouth. This fire is evidently above the 700-foot level—between there and the surface. It may burn for months yet, but that will make little or no difference, as the mine is being brought iato good working eondition, regardless of the upper levels. A splendid new hoiler is being put in at the hoisting works.

VIRGINIA CONSOLIDATED.—The shaft is down 211 feet. They will have their new steam hoisting works started the first of next week.

KENTUCK.—The winze connection will he completed this evening. It is at the south line of the Yellow Jacket, and is 100 feet in leugth. The Sunderland and Pioneer mills are crushing ore from this mine.

SIERRA NEVADA.—The first clean up for the month will be made Monday. The third monthly dividend of 50 cents per share on the new stock issue was declared Saturday, aggregating $7,500.

OVERMAN.—The Overman is looking well. The extensive body of ore at the 400-foot level is nearly 60 feet wide.

GOULD & CURRY.—Same of 22d: The drift east from the lower level is progressing well, but develops no ore as yet. The old upper workings of the mine yield 50 tons of ore per day, the assays of which averago over $40 per ton.

IMPERIAL-EMPIRE.—The clearing out and retimbering of the caved portion of the shaft, below the 1,000-foot level is completed to withiu one set of timbers of the 1,080-foot station. The upper workiags eontinue their usual yield.

BELCHER.—A good body of ore is developed, over 100 feet in leugth from the south line above the 300-foot level, averaging six feet in width, and assaying from $50 to $100 per ton.

VIRGINIA CONSOLIDATED.—Shaft 242 feet deep to-day. The new hoisting works will start up to-morrow. Excellent progress is made in sinking.

SIERRA NEVADA.—Progressing as usual, and the mill pounding away on a run of extra good ore.

FLOWERY.—The Flewery is looking better than ever. Connections have been made between the incline and lower tunnel. The air is good and the prospects of the company flattering. They have upeu their dump 300 to 400 tons of ore which will pay a big profit.

OCCIDENTAL.—The lower tunnel is now in the ledge, and the experts agree that it is a big thing. The ledge, as all agree, is one of the most regular and best defined in the State, and the pay streak is found to be continuous from the creppings down te the present lowest working level—600 feet.

MILL ADDITION.—Gold Hill *News*, Aug. 19th: An extensive addition is being built to the Birdsall & Carpenter mill, Dayton, 136 feet in length by 60 feet in width. It will contain 20 pans, together with settlers, etc., but no stamps, as it is intended exclusively for the working of tailings, an immense amount of which have been collected during the last few years.

WHITE PINE.

MINING REVIEW.—*News*, August 21st: Werk has progressed quietly during the week. Two or three mines that had been idle have started up again; but the continued stringency in the money market of San Francisco operates as a serious hindrance to the resumption of werk on a large scale. Some of our leading mines that are constantly sending bullion te their offices at the Bay find it difficult evea to obtain coin enough at the present time to pay off their men. While this conditien of affairs exists, we cannet look for the usual activity in the work of development. It is gratifyiag, however, to observe that we are beginning to feel the effects of Eastern capital seekiag investment here. One sale has been effected, and negotiations in regard to others are pending. The hullion shipments of the past week fall below the average. The total amount, as published from day te day, is $49,925.30.

The same journal of another date says: "One may learn from tho *Reveille*, or almost any of the outside papers, that White Pine is a complete failure. But, strangely enough, millmen have seen inducements to justify hringing here and setting up somewhere about 130 stamps already; and they get a higher price for working ore than anywhere else; and the ore yields more dollars to the ton than rock found anywhere else; and the ery is 'more stamps' to work the ore accumulated on 200 dumps; and millmen are hunting places to set up their works; and machinery is eontinually arriving; and a water supply system of machinery, costiag more thau any private local enterprise on the coast, is erecting, owned by careful, shrewd capitaliste."

ITEMS.—*News*, 16th: Eclipse Consolidated, Chloride Flat, struck rich ore on Saturday....17th: The Anchor tunnel has struek a ledge, and is taking out good milling ore. The tuunel is in 85 feet.... Eberhardt is yielding a higher grade of ore than at any former period....Treasure Hill Consolidated is sinking a new shaft, and finding rich chlorides....Wooloomooloo shaft is down 36 feet in slate....18th: Tom Taylor showed us some very rieh ore yesterday from the Davis and Atchisou claims in the Mount Ophir regioa. The veiu is but four or five inches thick, but there is plenty of ore that will yield $100 and upward associated with and adjoiaing it. It is free from base metals. The Joe Trench mine in this vicinity yielded $800 per ton by smelting....Fiae orc is being taken taken from the Bromide tuanel.... Work resumed on the Argyle with 12 men. Thunderholt is being vigorously worked. ....Converse & Co's shaft is turning out good ore at a depth of 28 feet....Ditto Montauk....20th: The jnry gave the bullion in dispute to the plaintiff iu the ease of South Aurora *vs.* White Pine Mutual.... The Tom Paine miae was sold recently to Chicago parties for $12,000....H. F. Rico shaft is 50 feet dowu in limestone. Rock changing....Pocotillo now worked by two shafts. Good ore coming out ...A prospect ehaft is being suak on the Phil. Sheridan. Ore on the dump good....Assays from the James-Emma go $289 the ton. ....City of Dublin struck spar yesterday at 13 feet....Edgar shaft down 45 feet; indications good....Post-hole dividend for July is $4,000 per share. Four shares in the claim....A party of Cincinnati capitalists intend to put up a mill in the district. Five of them arrived to-day....*Empire*, 18th: Virgiaia 50 feet down; now in a large 30-foot chamber, showing ore on all sides except the south....Good ore from the Perley; one piece worth $400 per ton. ....19th: Several of tho prominent mines are housing in their shafts for winter.... 20th: Bowie & Brown's tunnel in 70 feet, and shows good ore.

MILLS.—*News* 17th:—Johu Tregloan has made arrangements to erect an excellent mill between this city and Hamilton. The mill is a perfect set of machiaery, ten stamps of 750 pounds each, capable of crushing fifteen tens in twenty-four hours, with five improved Varney pans aad two settlers—all to he driven by a fine engine of 40-horse power. On the ground is some natural water, and what is wanted over this will be furnished by the Water Company. The mill is the property of Messrs. Perkins, Flint & Co., of San Francisco, and is to be employed on custom werk.....Kohler Mill is erushing rock from Babyloa. We are informed that its crushing capacity it te be increased.....22d:—Stanford Mill building is nearly euclosed and most of the machinery already in place.

OUTSIDE DISTRICTS.—*News*, 19th: Steptee District was organized ou the 11th inst. It is 120 miles N. E. from here, 30 miles south of Humboldt Wells on the railroad. Mr. Osborne recently shewed us some exceedingly rich specimene frem there. Weed and water abundant. *Empire*, 18th: Letter from Pinto, says: "Seme of the richest ore ever seen iu any miniug district is beiag taken out and hauled to the Mohawk mill fer reductien." * * "The San Francisco Co. is hauling rock to the Newark mill. The rock is rich enough te pay for it."....The peorest looking piece of ore in a sack full of samples from Reveille District brought by Mr. Langmore, assayed $196 per tea.....21st: Letter from Kern District, says: "This district must eventually be one of the first camps ia the State."....*Telegram*, 18th: Patterson District mill will be runniag next week.

WATER WORKS.—*News*, 21st: Water is already into Hamilton and was yesterday runniag to waste. It will be on the Hill in a few weeks. The Hamilton reservoir, 8,000 galloas, was filled in 39 miuutes—although it leaked at first.

COAL.—*Empire*, 21st: We were yesterday shown a sample of the coal recently discovered on Pancake Mountain, 15 miles west of this city on the Austin road. It has tho appearanco of being the genuino article.

New Mexico.

MOREno.—The *Lantern* says: The clean up on Spanish Bar was a little over $300. ....The mines on Willow Creek had a good week's run. From two or three claims we hear of $400 each, and another $880.....Polloek, at the foot of Grouse Guleh, cleaned up $781, the result of the labor of ten meu for four days.....The California Co., in Humbug, cleaned up $411, being at the rate of about $11 per day for every man employed.

ALBUQUERQUE.—*Review:* Ten pounds of quartz taken from the Langston lode at Pinos Altos, yielded 24¾ ounces of gold.

Oregon.

THE LEWIS RIVER MINES.—*Oregonian*, Aug. 14th: Nothiug very definite seems to be yet known conceraing the richness of the mines on Lewis River, but parties are constantly going out from Vancouver, and there seems to be a general belief that fair wages can be made. The *Register* says: About 20 pack animals loaded with provisions and tools have left for the diggiugs within the past week.

We learu that diggings have been struck near Chelatchie Prairie, richer taan those at Texas diggings.

Jack Maguire, an old miner, has found mines on Cedar Creek. He says he ean make from four to six dollars per day. There seems to be a general confidenco in the continuance of these mines.

Mr. G. W. Miller says he shall start in on Lone Star Creek, where Texas is. He says there is plenty of gold out there.

We would state for the information of those going to the Lewis River mines that to go by tho way of Vaneouver is tho best routo.

PERRY CREEK MINES.—Walla Walla *Union*, 7th: Mr. James Smith arrived here from this new mining camp on Tuesday last. He reports the camp in a flourishing condition, the miners generally having more confidence in their richness. The claims which have been properly worked have paid well, and some largely. Nuggets worth from $25 to $100 have beeu takon out.

MOOSE CREEK.—Same: Mr. Daniels, ono of the returned victims from Moose Creek, pronounces it one of the greatest humbuge of the day. He says tho greatest discovery claim did not pay the company 25 cents per day to the hand.

GALVANIZED IRON.—This is iron "zinced" by removing the scale with sulphuric acid and immersing in a bath of melted ziuo.

San Francisco:
Saturday Morning, Aug. 28, 1869

Notices to Correspondents.

Carpenter.—It has been found by experiment that cubes of the same size of the following different woods, when allowed to remain in contact with water for five months, lost respectively of their substance the following percentages: Unseasoned oak, 24; seasoned oak, 12; African teak, 3½; Moira wood, 4; Honduras mahogany, 3; Santa Maria, 1.6; Greenhead, 5.6; Moulmein teak, 1.7. The facility of mildewing or seasoning was found to be in the following order: Unseasoned oak, rapid; seasoned oak, much less; African teak and Honduras mahogany, much less; Moira wood, Santa Maria and Maulmein teak, none.

B. Y.—Volcanic action does take place in very high latitudes, as two volcanoes were observed in actual eruption by Scoresby on *Jan Mayen's Island*, in latitude 71° N., their lavas being described as basaltic; and the east coast of Greenland is said to be of volcanic formation through many degrees of latitude,—massive alternating beds of basalt and basaltic conglomerate rock composing the cliffs of the coast. Mt. Erebus, in Victoria Land, according to Sir John Ross, is a volcanic mountain rising more than 12,000 feet high, and is in so high a southern latitude as 73° S.

A. Z., Silver City.—The mode of formation of many rare minerals may be surmised, according to St. Claire Deville, by the reaction of volatile fluorides on vapor of water and oxygenized compounds; thus occasioning mutual decomposition and exchange of elements. As an example may be instanced the fact that volatile fluoride of aluminum acting on boracic acid will cause the production of oxide of aluminum (corundum, which, when crystallized and transparently-colored, forms the ruby and sapphire) and fluoride of boron.

Peripatetic, Santa Cruz.—We suspect the black mineral described by you as found in your mountains is *Lepidomelane*, which has been shown by Professor Houghton to resemble black mica. The latter-named mineral abounds in the granite of the Santa Cruz mountains.

Bibulous.—The bubbles formed by pouring water into a glass tube are owing to the formation of a cavity at a point where the descending water meets the fluid underneath; the cavity closing up, the bubbles form from the motion imparted to the surface.

C. G., Oro Fino—Your query will probably be answered in our next.

Commissioner Raymond was at Dalles, Oregon, on the 13th inst. He was about to visit the mines of Grant and Baker counties, after which he would proceed up the Columbia on his way to Idaho and Montana Territories.

The Loud-Cole Patent Case.

Many of our readers will recollect the paddle-wheel case, before the Patent Office, several months since, wherein Senator Cole figured as inventor, apparently at the expense of Mr. Alfred C. Loud, of this city. It appears that Mr. Loud invented an improved steamboat paddle-wheel, in August, 1868, and went to Washington the next October to secure a patent for the same. While there he very naturally called on Senator Cole, who, seeing he had a valuable invention, quite as naturally took a very deep interest in it. The result was that a patent was speedily allowed, and an arrangement subsequently made between Loud and Cole that the latter was to spend some $10,000 in experiments, to further improve the invention, and secure foreign patents for a one-quarter interest in it.

To give time for this, the patent was allowed to remain in the "secret archives" of the Patent Office—the last fees remaining unpaid; while Messrs. Loud and Cole were engaged in completing their experiments in New York. During the course of these experiments, in which some material modifications were made in the invention, Mr. Loud received letters from San Francisco, calling for his presence here; and it was agreed that Mr. Cole and their engineer should continue their studies and experiments during Mr. Loud's absence, and when all was completed, new patents were to be taken out, and a one-quarter interest conveyed to Mr. Cole; but Mr. Cole was to proceed with the foreign patents during Mr. Loud's absence. Mr. Loud also continued his experiments on his voyage to San Francisco, and arrived at certain important results, which induced him to hurry back overland, five days after his arrival here, to communicate his discoveries to Mr. Cole. They met in Washington, and Mr. Loud was somewhat surprised to learn from Mr. Cole that he (Cole) had arrived at the same improvements himself, for which he had made application for a patent in his own name! On a further conversation, Mr. Loud was still more surprised to learn that Mr. Cole had also taken out his (Loud's) papers, which had been filed in the secret archives, paid the last fees, and made the papers public; and all this against special instructions to the contrary. The chief clerk of the Patent Office testifies to the manner in which Mr. Cole obtained the papers, in a manner anything but creditable to Cole if incontrovertible.

We condense the above facts from the sworn and published testimony of Mr. Loud, taken in the case of interference which grew out of the transaction, in April, 1869. A judgment in the matter was rendered August 2d, deciding the question of priority of invention in favor of Mr. Loud. In making his decision, the Commissioner stated that nearly all the evidence was on the side of Loud; and that to arrive at any conclusion adverse to his claim, "must be accompanied by a decision that all the witnesses referred to are guilty of swearing to outrageous lies, thereby deliberately and shamelessly committing perjury. Such a decision I cannot make, in the absence of any proof to sustain the same."

The Microscope and the Silk-grower. Mons. Comalia has extended the use of the microscope beyond the examination of the eggs by its means, for the purpose of throwing out those showing certain corpuscles which are the sign of disease. He examined the *moths themselves* before they deposit their eggs. Those which are tainted with the disease are rejected, and thus the exclusion of diseased ova made more sure; for it has been found that the ova from a diseased female do not invariably exhibit the corpuscles, although they must necessarily be tainted.

Returned.—Mr. H. J. Booth, of the Union Foundry, has returned from a brief trip East.

The California Sugar Refinery---New Process.

The California Sugar Refinery, located on Brannan street, corner of Eighth, commenced operations in April, 1865, in a wooden building, with a capacity for manufacturing 25,000 pounds of white sugar per day. In 1868 they put up an additional building of brick, 60 by 50 feet, increasing their capacity to 40,000 pounds per day. During the past year they have erected a large brick building, 85 by 100 feet, and five stories high, with a brick boiler room 38 by 50. The capacity of the present works, when they are fully completed, will be 142,000 pounds per day. The engine, which is a magnificent one, fitted with every modern appliance, force pump, air pumps, etc., for the new works, was built at the Vulcan Foundry, and may be classed among the finest work of the kind ever turned out on this coast. The engine cylinder is 24 inches diameter, with a 48-inch stroke, and turns a mammoth driving wheel 18 feet in diameter with a 21-inch face. The pump is double-acting, with three feet stroke. There are two air pumps in use at this Refinery.

When all the machinery is in place, eight tubular boilers will be required for making steam, each of which will be 60 inches in diameter by 16 feet in length. As yet, however, four only are in place. The old building is to be employed exclusively for filtering and re-burning the bone-black employed in the filters—leaving the entire area of the new structure for the other portions of the process. Two vacuum pans are employed, one of which has a capacity of 60,000 pounds, the other 40,000. The foundation of the new structure was laid by Claus Spreckles, the President of the Company, on the last day of 1868. Its cost has been $250,000. These works are at present under the immediate charge of Mr. Peter Spreckles, a brother of the President who is now absent in Europe.

The locality of the works is most particularly favorable for the business, which requires much heavy transportation, the rear portion being located directly upon Mission Creek, to which, as soon as the contemplated improvements in Mission Bay have been completed, vessels of eight feet draught of water will have free access.

A New Process.

One of the most interesting things connected with this enterprise is the fact that an entirely new process is employed here for converting the sugar from its granulated state into the loaf or crushed condition in which it goes into the market. This process is an invention patented through the Mining and Scientific Press Patent Agency, by Mr. Claus Spreckles, about two years since, and as yet employed at these works only. By its use a great saving is effected in both time and labor.

By the ordinary process the raw sugar is first dissolved in water, then filtered through bone charcoal, then boiled in a vacuum pan,—that is, in an air-tight boiler from which air has been pumped until the sugar will boil and throw off its water at a very low temperature, say 85°,—until it has arrived at just the condition in which the greatest amount of sugar can be crystallized out of the syrup. It is then placed in a centrifugal machine—a kind of perforated wire basket, which operates as a strainer, allowing the syrup to be forced out by centrifugal action, while the sugar is retained.

Up to this point all manufacturers pursue about the same course. In the ordinary way, the sugar thus separated from the syrup, is placed in molds—sugar-loaf-shaped—where it gradually hardens, so that the mold can be inverted, when the small remaining amount of syrup drains off, after which the loaf is removed from the mold and placed in a moderately warm room for a few days to harden, when it is taken to another room, called an oven, where the temperature is kept up to about 140°; from the oven the loaves are taken to a breaking machine, where they are reduced into different degrees of fineness for the market, in which it is sold as crushed or pulverized sugar.

About fourteen days' time and a large amount of manipulation and heat is required in the ordinary way, for that portion of the process between the centrifugal and the breaking machine. All this work is done at the California Refinery, under Mr. Spreckles' patent, in four days' time, with a proportionately decreased amount of handling and heating. The sugar, as it comes from the centrifugals, is pressed into bricks or slabs, 12 by 14 inches superfices, by three inches thick. These slabs are dried like bricks in a common atmosphere for 24 hours, then go to the "oven" for 24 hours longer—then to the breakers. The saving effected by this simplification of the old process is about three-quarters of a cent per pound. When these works are fully under way, the daily saving by the use of this improvement will exceed $1,000 per day. If this saving was applied to all the sugar consumed in this country it would amount to the enormous sum of $6,000,000 annually! Few inventions have been brought out in any country or age which have been able to effect greater savings in human industry than this. We understand that negotiations are now pending for the introduction of this process into a large establishment in New York.

The Overland Monthly.—This popular magazine, the pet of California readers, and the envy of Atlantic publishers, is out for September. The table of contents, which is all we have had time to read, is enough to make any man's mouth water—at any rate if he has ever seen a number of the magazine before,—that is, of course, if he is a San Franciscan. We fancy that we can always recognize one of Bret Harte's articles by the title. There seems to be something suggestive in it. We think that the publication in the hands of its present proprietor, Mr. John H. Carmany, fully maintains its early reputation. We promise ourselves as usual a couple of hours of the rarest gown and slipper enjoyment with it.

Map of the San Joaquin Valley.—Mr. Gensoul, of the Pacific Map Depot, 511 Montgomery street, has laid upon our table a new and most useful map of the San Joaquin Valley—a portion of the State to which, just at this time, a large share of attention is being drawn. This is by far the most complete map of that section which has yet been published. It was drawn by M. Walthall, chiefly from the latest authorities, but in part from actual surveys, and lithographed by Britton & Rey. The lines of the Western Pacific Railroad are marked out, and the proposed routes of the Stockton and Copperopolis, Stockton and Tulare, and Southern Pacific, are also given. A tabular statement is given of the names, number of acres, dates of patents, final survey and number of survey of the different Spanish grants embraced in this section of the State, and the names of the parties to whom they were confirmed. The whole is done with much care, and with an evident regard for accuracy.

The Sierra Chispa.—There was such an immense rush to see this $30,000 nugget when exhibited at an assay office in this city, that the keeper was obliged to withdraw it in order to proceed with his business. It ought to occupy a prominent place in the coming Fair.

Minerals for exhibition at the Mechanics Fair sent to our care, prepaid, will be duly exhibited and returned as the owner may request.

The Humboldt Anniversary.

On the 14th of September next a century will have elapsed since the birth of Alexander von Humboldt,—one of the most remarkable men who ever lived. Although by birth a German, his love of science and passion for travel made him eminently cosmopolitan. His memory is revered and his name is cherished wherever science is known. No tourist of any note who goes to Berlin fails to make a visit to the unpretending village of Tegel, where repose the ashes of the great naturalist, by the side of his mother, his brother and his sister; and where an inscription on the pedestal of an unpretending column tells the visitor that he is contemplating the last home of a family, which not only Germany, but the whole world delights to honor. Here, just without the limits of the gay city of Berlin, after a long and active life, spent in investigating the secrets of nature, in both the old world and the new, this truly great man came to spend the evening of his days, near the same great forests, the same green hills, and the same beautiful lake, which he so much loved and admired in his childhood years.

To-day, in all the principal cities throughout the civilized world, we hear of preparations being made to celebrate the anniversary of his birth; and San Francisco will not be behind her sister cities in paying her tribute to departed genius and worth. His countrymen in this city, who are very naturally proud of the man who, by securing such world-wide fame for his services in behalf of the cause of science, has added luster to the German name, are determined to do justice to his memory. Several meetings have been held, at one of which no less than twenty-eight German societies were represented. It has been decided that the general festivities of the day shall be held at the City Gardens. A procession will be formed at eleven A. M., and after marching through some of the principal streets, will proceed to the gardens. Mr. Leo Eloesser has been selected as the poet for the occasion, and Mr. Emil Niemier as the reader. The speaker in English will be Prof. Blake; in German, Rev. Dr. E. Cohn. Invitations will be extended to consuls, pioneers, scientific associations, and others. A grand concert and ball will take place in the evening, and the gardens will be brilliantly illuminated. It will be an occasion in which our citizens generally should participate. From the activity displayed on the part of those who have the matter in charge, there is no doubt that the affair will be a decided success, and a display every way worthy of the occasion.

France and her Future.—Napoleon III has never done an act which will tend more to his real popularity, and to the permanence of his dynasty, that his late ready acquiescence in the expressed will of the French nation, in relation to governmental reform. The Emperor has now assumed the character of a constitutional sovereign, and under circumstances which encourage the hope that revolutionary changes are done with in France, forever. The movement, quiet and peaceful though it has been, is one of the most important which has ever occurred in French history, and one fraught with immense consequence to the whole civilized world. Industry and commercial progress have now a guarantee of uninterrupted progress in France; and her people have entered upon a career of national importance, without parallel in any previous stage of her history.

Giant Powder *vs.* Fish.—The Nevada *Gazette* says that a party which recently went to the upper waters of the Yuba on a fishing excursion, not finding the sport with hook and line sufficiently exciting, exploded a small charge of giant powder in the water. The effect was astonishing—all the fish in the immediate vicinity, large and small, being instantly killed.

Tobacco De-incotinized.

We give the following extracts for the benefit of smokers; hoping, however, that the effect will not be to make them smoke the more. But perhaps there is no great danger of that; for, as we understand it, the antidotes to tobacco which are mentioned below, serve to prevent the agreeable,—as well as the *dis*-agreeable,—consequences resulting from its use. If that be the case, the true lover of the "weed sublime" will "more admire, by far, its naked beauties"—and will eschew all such trashy concomitants as sassafras bark and tannin; though the boy in his teens, who desires to be thought manly, and who to that end chews liquorice, in order to give his saliva a reckless and dissipated color, will doubtless hail with delight the information herein contained and regard it as a perfect god-send.

Dr. T. Williams (*Chicago Medical Journal*) recommends smokers to place in the bowls of their pipes a little powdered tannin. The smoke,—he says,—"will thus be deprived of its characteristic aroma, and all the vaporized nicotine, which is the intoxicating principle. At first the smoke will be entirely free from all taste and smell of tobacco; but as the sponge becomes charged with the nicotine, the odor will reappear. By changing the sponge frequently, the smoker may indulge in his habit as immoderately as he pleases without injurious effects."

Dr. Thompson of Nashville, Tenn., having been told that the dry bark of sassafras, if mixed with the tobacco would prevent unpleasant effects from smoking, tried the experiment, and reports as follows:—"I tested this repeatedly by smoking a strong pipe until my head was very disagreeably impressed, and then reloading with a mixture of sassafras bark;—a few puffs of which latter invariably dispelled the unpleasant sensations."

Dr. Shelby, of Huntsville, Ala., quotes the above in a communication to the *Boston Journal of Chemistry*, and says:—"I have again and again, in my own person, verified the statement of Dr. Thompson; but have generally used the *oil* of sassafras, putting a few drops on the end, and allowing time for its absorption and diffusion through the cigar. * * In making the experiment with the pipe, it is best to cover the oiled portion of the tobacco with some that is dry, or it will not burn so readily; or, if a blaze is used to light it, it will burn too rapidly, and prove pungent and disagreeable."

Coöperative Ship-Building.—An effort is being made to establish an extensive coöperative ship-building enterprise at some convenient point on Puget Sound. Six large ship-yards have already been permanently established there, and evidence is fast accumulating to show that the locality is one of the best for that business in the Union. Capital and skilled labor is already being transferred thither from New England, and the prediction is ventured that ere long Puget Sound will become one of the most important ship-building localities in the United States. However this may be, it is gratifying to learn that American ship-building is reviving everywhere. A slight modification of the tariff on ship-building material, which will probably be effected at the next session of Congress, will still further quicken and increase this important branch of our national industry.

Mr. E. P. Hicks, owner of the patent right for this coast for Dickason's patent self-opening and closing farm gate, has just returned from an extended trip through Northern California and the State of Oregon. We understand from him that the right for nearly all that section has now been disposed of. The gate is highly recommended on good authority, as will be seen by advertisment on the last page of this issue.

Familiar Science.

Why do Cats' Eyes Shine in the Dark?

Every body is familiar with the fact that the eyes of a cat shine in the dark;—but it is not so generally known that this phenomenon is almost or quite as strongly developed in various other animals, as the dog, the sheep, the cow, the horse; also several species of serpents and some insects. Various theories have been suggested to account for these phenomena, since attention has been, in later years, more especially turned to the investigation of such subjects.

This shining was at first attributed to a principle of absorbcuco, as diamonds are supposed to throw out the light in a dark room which they have accumulated in the sunlight. Phosphoresceuce has also been suggested as the possible nature of such light. It was also assumed that this accumulation or phosphorescence, served as an aid to those animals that possessed it, by assisting them to see and guide themselves, for a time at least, after the light of the sun had passed away. These explanations and assumptions were deemed sufficiently plausible until the science of anatomy revealed the fact that the mechanism of the eye when carefully considered, would not admit of such conclusions. On reconsidering the question, observers discovered that the eyes of cats never shone in intense darkness—that the phenomena is perceivable only when the eye of the observer receives a certain degree of light from surrounding objects or openings for the entrance of outer light. Hence the eye of the cat and other animals shines simply by reflected light, as from a mirror. It is also now known that neither a cat nor any other animal has a particle of vision in absolute darkness. The greater or less power of vision in animals is mainly due to the power of contraction and expansion of the pupil; but in part also to the sensibility of the retina. The less light the eye of the observer receives, (always supposing it to receive enough for faint vision) the more is it sensible to that which the eye of the cat reflects. These conditions of the phenomena, now fully ascertained, reduce the once supposed phosphorescence of the eyes of a cat, to simply the reflection of light by a shining object.

The Dark Spots on the Sun are not really dark—they are only apparently so by comparison. They are supposed to be aggregations of gaseous matter less highly heated, and consequently less luminous, than other portions of the sun's luminous atmosphere. These spots are dark, when seen on the sun's surface, just as the flame of a candle, or any other, even the brightest artificial light is dark when held between the observer and the sun. The spots which are dark while in the center of the sun's disk, become red, when seen upon the edges of that luminary during a total eclipse. Observations confirmatory of this, will doubtless reach us from the observers of the late eclipse, whose attention was especially directed to such examination.

Fleas on Dogs.—Fleas and other vermin have a "life and death" dislike to oil of any kind. Its presence in any considerable quantity closes their breathing tubes, and at once suspends animation. Place even the smallest quantity of oil so that it will completely coat an insect and it will speedily die. A dog may readily be freed from fleas by rubbing common olive or sweet oil into his coat, so as to saturate the hair quite to the skin. Let it remain for half an hour, then wash away the oil with warm soap suds. A small quantity occasionally brushed into the hair of a dog will keep the fleas from making a lodgment there. Matrons with large families of very small children, may find it to their advantage to take this hint.

Why the Hair Sometimes Wont Grow. People generally seem to think that by the use of hair-oil, hair may be made to grow anywhere, when the truth is that hair grows like a plant. It has its root and stalk; the stalk may be broken off frequently, and yet a new shoot springs up, perhaps more vigorous than the first. This process may be, and often is, repeated many times during the life of the individual. Fever, erysipelas of the scalp, and many acute diseases, are followed by the breaking off of the hair, and temporary baldness. But the hair-bulb still remains uninjured, and a new growth is sure to follow. This new growth may be hastened by stimulation of the scalp, as by friction, irritating washes, etc. But when from any cause the roots of the hair die, there is an end, for all time, to the growth of hair in that soil. By no art or device can a new crop be sown or transplanted. Hair-oil is as useless as if applied to the sole of the foot. We cannot always tell when the hair-bulbs are actually dead without the trial of means to invigorate them; but there is no doubt that incurable baldness is sometimes hereditary, and that it frequently follows some constitutional diseases. On the contrary, falling of the hair after acute diseases, or earlier in life than usual in the family descent, or any unusual trouble of body or mind is, almost without exception, temporary.—*Hearth and Home.*

The Soil Breathes.

Does the soil breathe? Certainly it does, just as you do. A few years since, if one asserted that trees had lungs and breathed, he would have been held to an argument to prove it; just a few years earlier nobody would have believed that a fish's gills, and the leaves of a tree, and the lungs of a beast, all performed the same office, that of ærating the blood or sap. The soil breathes. How does it breathe? Its circulating fluid, the blood of the soil, is water; this comes to it from the air, and is already ærated. True, but this soon loses its gases by contact with the soil, just as the arterial blood fresh from the lungs, loses its oxygen when passing its circuit in all parts of the body. The blood comes back to the lungs for more oxygen, but the blood of the soil cannot do this, so we must let the air in to come in contact with it. We cannot here explain the working of the air in the soil, but would thus briefly enforce the necessity of stirring the soil during droughts as deeply as practicable, not to interfere with the roots of growing plants, and those of previous culture, so that a deep light soil shall invite a free circulation of air beneath the surface. Hot air, the moment it passes beneath the surface becomes very moist, from the water which it originally contained, and it deposits it, thus not only ærating the soil, but adding to its moisture. Cold air can hold but little moisture, but hot air dissolves an immense quantity, which it deposits when it cools, or on cool surfaces. Who has not noticed of a winter's day, a locomotive leaving behind it a snowy cloud of vapor, like a comet's tail, often floating for minutes after the train has passed? Think of this, and watch the steam car on a day like those of midsummer, the hot breath, just as full of water as in winter, is puffed out into the eye of the sun, and not steam enough shows to make a shadow, so quickly is it absorbed by the air.

To Detect Malarious Districts.—The *Engineer* is authority whereby people seeking rural homes for the summer may satisfy themselves—and that with far more certainty than from the assertion to the contrary of interested property-holders—concerning the existence of fever and ague causes. In regions subject to miasmatic diseases, organic matter is found in the greatest abundance in the form of spores. The identifying of these spores depends on the property of sulphuric acid to set free carbon from its combinations in organic substances. If, then, a watch glass containing sulphuric acid be exposed to the atmosphere of a suspected region, its surface will become blackened with a rapidity depending upon the malarial tendencies of the place.

What Would Occur if the Earth Should be Stopped in its Orbit.—If the earth should be stopped in its orbit, it would begin to fall straight towards the sun. As it approached more nearly to that great source of heat it would soon reach a point where the temperature is as high as two hundred and twelve degrees, and then all the waters of the ocean would be evaporated. As it drew still nearer, the rocks would be melted, and afterwards they also would be evaporated. Before it reached the sun this solid earth would be converted into a vast volume of red-hot gas, which, when it fell into the fiery atmosphere of the sun, would merely produce blasts of wind at the point where it struck outward in all directions.

WATER FOR A MILL SUPPLIED WITH SNOW.—The *Inland Empire* of August 19th, says: Bassett's mill, well up on White Pine Mountain, is run altogether on snow water. During last winter large drifts of snow were housed in with pine boughs high up on the mountain, and the same is now hauled to the mill in wagons, to be used for generating steam which keeps the machinery in motion. The snow is dumped into a large vat where the exhaust pipe discharges, and in this way it is melted for use in the boilers. About three tons of snow are daily consumed in running the mill, and the supply on hand is said to be ample to last until winter again sets in.

Ayer's Cathartic Pills,
For all the purposes of a Laxative Medicine.

Perhaps no one medicine is so universally required by everybody as a cathartic, nor was ever any before so universally adopted into use, in every country and among all classes, as this mild but efficient purgative *Pill*. The obvious reason is, that it is a more reliable and far more effectual remedy than any other. Those who have tried it, know that it cured them; those who have not, know that it cures their neighbors and friends, and all know that what it does once it does always—that it never fails through any fault or neglect of its composition. We have thousands upon thousands of certificates of their remarkable cures of the following complaints, but such cures are known in every neighborhood, and we need not publish them. Adapted to all ages and conditions in all climates; containing neither calomel or any deleterious drug, they may be taken with safety by anybody. Their sugar coating preserves them ever fresh and makes them pleasant to take, while being purely vegetable no harm can arise from their use in any quantity.

They operate by their powerful influence on the internal viscera to purify the blood and stimulate it into healthy action—remove the obstructions of the stomach, bowels, liver, and other organs of the body, restoring their irregular action to health, and by correcting, wherever they exist, such derangements as are the first origin of disease.

Minute directions are given in the wrapper on the box, for the following complaints, which these *Pills* rapidly cure:—

For **Dyspepsia** or **Indigestion, Listlessness, Languor** and **Loss of Appetite**, they should be taken moderately to stimulate the stomach and restore its healthy tone and action.

For **Liver Complaint** and its various symptoms, **Bilious Headache, Sick Headache, Jaundice** or **Green Sickness, Bilious Colic** and **Bilious Fevers**, they should be judiciously taken for each case, to correct the diseased action or remove the obstructions which cause it.

For **Dysentery** or **Diarrhœa**, but one mild dose is generally required.

For **Rheumatism, Gout, Gravel, Palpitation of the Heart, Pain in the Side, Back** and **Loins**, they should be continuously taken, as required, to change the diseased action of the system. With such change those complaints disappear.

For **Dropsy** and **Dropsical Swellings** they should be taken in large and frequent doses to produce the effect of a drastic purge.

For **Suppression** a large dose should be taken as it produces the desired effect by sympathy.

As a *Dinner Pill*, take one or two *Pills* to promote digestion and relieve the stomach.

An occasional dose stimulates the stomach and bowels into healthy action, restores the appetite, and invigorates the system. Hence it is often advantageous where no serious derangement exists. One who feels tolerably well, often finds that a dose of these *Pills* makes him feel decidedly better, from their cleansing and renovating effect on the digestive apparatus.

Mining Property for Sale.
A Two Thirds Interest
OF THE
Golden Rule Mining Company's
Claims and Mill,
Situated in Tuolumne County, California, two and a half miles south of Jamestown, on the Great Mother Quartz Lode. A good 15-stamp Water Power Quartz Mill is situated on the property, with a never-failing supply of water, as can be shown by the last four years continual running. This Claim has three parallel Ledges, from 50 to 100 feet apart, averaging from two to six feet in width, with a length of six hundred feet. They are so situated that a tunnel has been run through them at right angles, making a surface drainage of from seventy to eighty feet in depth on the mine. The mine is well ventilated by shafts from the surface, and well timbered so far as worked. In the mine are steam Hoisting Works, capable of hoisting from a depth of 3 0 feet. A force of thirteen men only are required to keep both mill and mine running regularly.

On the surface and flats for a distance of 500 feet from these veins, the ground or surface was mined by placer miners, in former years, producing from two to five ounces per day to the man, during the season when water could be obtained, which fact goes to prove that a heavy deposit of ore was once contained in the croppings of these shutes, which, by all former and present theories of deep mine workings, came from below, indicating that when sunk upon to a proper depth, the lead will develop a mine equal to the Amador or Eureka.

This claim has paid its 19th regular dividend of $1,500 each, during the past four years, besides all the construction and other expense account, and has levied no assessments during the same time, and at present has on hand $8,000 in the Treasury, and no debts.

The last level, 150 feet from the surface rock, averaged $7 per ton, on which was a profit of from $1 to $1 50 per ton. The length of the two shutes of ore on the east vein, and the only one worked upon, has been about 200 feet.

Now I propose to sell two-thirds of this valuable property for $16,000, cash; and any party who desires, to purchase a property of this kind—which theory has proven that it requires depth, on well known shutes of ore, for a sure fortune—can obtain a chance here, providing he or they will go down a sufficient depth. No purchaser is solicited unless he first goes and examine the mine, or sends a mining engineer in whom he can have confidence, to indorse what he may think proper of what has been here stated.

For any further particulars, direct by letter to Wm Bosworth, San Francisco, P. O. Box 1978, or at my office, room No. 5, over Donohoe & Kelly's Bank.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.
"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa, and Soluble Chocolate. Steam Mills, Brick Lane, London.

TRADE MARK.

New Almaden Vichy Water,

(CALIFORNIA VICHY WATER.)

FROM THE SPRINGS,

NEW ALMADEN,

Santa Clara County.

F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.

OFFICE, 506 JACKSON STREET,

GENERAL DEPOT:

Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the venous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever;* Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and tenacious Vomiting; Weakness of certain Organs; the indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever;* Gout, *when the patient is still able to walk;* Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece

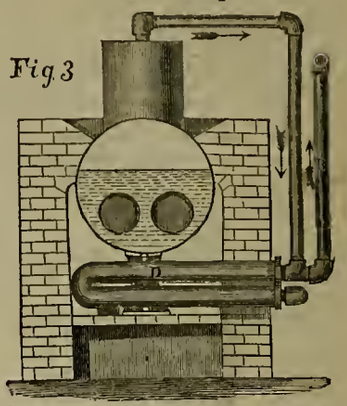
CARVALHO'S
Patent Steam Superheater

Fig 3



[SECTIONAL END VIEW OF BOILER, WITH SUPERHEATER.]

Saves Fuel! Saves Water! Saves Pressure!

Brief Extracts from letters from parties using Carvalho's Superheater. Full letters can be seen on application:

NAVY YARD, Washington, June 15, 1869.
"Superheater saves 12 per cent. in fuel and 10 per cent. more in speed of engine."

NAVY YARD, Washington, Oct. 8, 1867 (after seven years of service.)
"Superheater yet attached to boilers, and appears to be in good order."

HOWARD WATCH AND CLOCK CO., Boston, May 19, 1866.
"Superheater saves us at least 10 per cent. in fuel and gives a large increase of power."

JONES & SMITH, New York, March 21, 1867.
"Superheater saves 20 per cent. of coal, less steam pressure, exhaust more serviceable in drying paper."

STEAM ENGINE WORKS, South Brooklyn, April 23, 1867.
"Superheater saves not less than 20 per cent. fuel; no priming."

CROCKETT LEATHER CLOTH CO., Newark, N. J., Oct 16, '67.
"Superheater economizes 25 per cent fuel; does our work with 25 lbs. less pressure steam, and steam superior for drying purposes."

N. Y. DYEING & PAINTING ESTAB., Oct 4, 1867.
"Superheater brings contents of our dye vats to boiling point in one-third less time and one-third less increase of water; saves us at least 15 per cent. fuel."

CONTINENTAL OIL REFINING CO., Binghampton, N. Y., Sept. 20, 1867.
"Superheaters give entire satisfaction, and we superheat to 55 deg—an increase of 200 deg."

CARBON MANUF. CO., So. Hadley Falls, Mass., Oct. 17, '67.
"Superheater saves 15 or 20 per cent. fuel; steam for paper mill now perfectly pure and dry—an important advantage in our business."

STATEN ISLAND FANCY DYEING ESTAB., June 18, 1867.
"Superheater saves at least 25 per cent. in fuel, and we have the advantage (hardly to be over-estimated) of perfectly dry steam."

ÆTNA IRON WORKS, San Francisco, Sept. 15, 1867.
"Superheater saves 25 to 30 per cent. in fuel; no priming."

CONTRA COSTA LAUNDRY, Oakland, July, 1868
"Superheater causes a use of 50 lbs. steam instead of 60 lbs.; use much less water, and there is a saving in fuel."

HAVILAH M. CO., Cal., August, 1868.
"Superheater causes a use of 40 lbs steam instead of 60 lbs.; use much less water, and there is a saving of fuel." (2 sets.)

SIXTH MECHANICS' INST FAIR, S. F. Sept. 4, 1868.
"Superheater used proves that it saves fully 30 per cent. in fuel." (Chief Engineer.)

NEVADA MILL, Virginia City, May 30, 1869.
"Superheater is a perfect success, and saves three cords of wood in ten, or 33⅓ per cent. in fuel; engine works better."

And many other letters of the same tenor.

Awarded Silver Medal, Mechanics' Institute, San Francisco, 1868.

Awarded Silver Medal, Maryland Institute, Baltimore.

Awarded Silver Medal, American Institute, New York, 1867.

The Most Important Invention of the Day.

HALL & LEE'S

New Method of Packing Stationary Joints in Steam Engines,
— AND ALSO IN —
STEAM AND WATER PIPES.

BY THIS METHOD OF PACKING THE JOINTS ARE made perfectly steam-tight inside as well as outside, thereby effectually preventing the steam from cutting into the joints of the steam chest. Consequently, an Engine packed after this method will last twice as long as it will when other Packing is used; and the joints may be opened and closed every day, and they will be steam-tight every time they are closed, and the same Packing will remain good forever. Consequently, owners of mills will make a great saving, both in time and money, by having their engines packed by this method. Patented June 8th, 1869. By permission we refer to A. J. Binney, Supt. Northern California Railroad, and A. D. Starr & Co., Proprietors of the Buckeye Mill, Marysville. State, County and Mill Rights for sale by A. H. HALL & H. T. LEE, Marysville, Cal. 6v19-3m

A Long Desired Article

FOR CLEANING THE HEAD AND HAIR. THE CLEANing of the head and hair has been the subject of consideration for a long time. This object will be accomplished by using

CAMILLE CHAMPOO,

which not only does away with the poor soap so offensive to use, and so injurious to the hair, but it cleans the head, strengthens and beautifies the hair, preserves the color and prevents baldness. It is cooling in nature, and can be used with safety and reliance on the smallest infant. Price 50 cents per bottle. Prepared by EMERTON & LUELLING, 773 Mission street, San Francisco, Cal.

HEATHFIELD & BOGLE, Wholesale Druggists, 206 and 208 Battery street, San Francisco, sole Agents for the Pacific Coast. 24v18-3m

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. For the Week Ending August 17th.

Process of Treating Ores with Copper-Amalgam by Means of Electric Currents.—Andrew L. Nolf and François L. A. Piocbe, San Francisco, Cal.—93,899.

Photographic Plate Holder.—Joseph Buchtel, Portland, Oregon.—93,669.

Rock-Drill Point.—Charlton H. Davis, San Francisco, Cal.—93,684.

Carriage Spring.—J. W. Gilmer and W. H. De Valin, Sacramento, Cal.—93,703.

Lamp-Burner.—Perry Prettyman, Paradise Spring Farm, Oregon.—93,744.

Steady Rest for Lathes.—James Brodie, San Francisco, Cal.—93,801.

Screw Propeller.—Frederick Wittram, San Francisco, Cal.—93,848.

Not the "Old Saw."—A hand machine saw, of eastern invention, on exbibition at Kirby's rooms, Battery st., is described by the *Herald* as follows: It consists of a frame about eight feet long, with an ordinary buck saw fixed at oue end, so as to run in a grooved saw-way, while a wooden rod attached to one end of the saw connects with a fly-wheel at the back of the frame, whicb is turned by two men. The logs rest on two wooden jaws beneath the saw, which are joined by a lever while the saw is at work. Each revolution of the wheel produces six passes of the saw. Both handles can be used by one man, or one can be taken off if needed.

Election.—George F. Bragg, J. C. Wilmerding, P. Weaver, P. Cadne and J. F. Lyne, were elected Trustees of the West Poiut Miuing Company, August 25th.

It is an excellent publication of the kind, and, nextto the Mining and Scientific Press of SanFrancisco, we regard it the best in the United States.—*Colorado Register, July 15th.*

Mining and Scientific Press.—This excellent periodical has been for many years the faithful chronicler of important events and a medium of valuable information to the miners of the Pacific coast.

It has constantly furnished a reliable record of the progress in the mining, mechanical and scientific branches of industry, and its contents have been particularly adapted to the condition and business of the Pacific Coast.

For its usefulness and valuable information it is worthy of the patronage of an intelligent public.—*Shermantown Telegram.*

Returned.—Dr J. H. Paine, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

Photography.—For Cabinet Photograpus, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. Howland.

Co-Operative Union Store.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco 24v18-4w

Dr. Hall has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs Curling, Druit, Lee, Parker, Acton, Aitken, Churchill, Ricord, Velpeau, Boeck, Sperino, and Dewilz Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco 21v18 3m

Asiatic Cholera.—The Strongest Proof of Intrinsic Merit.—Dear Sir: I ought to have acknowledged long ago the box of Pain Killer you had the goodness to send me. Its coming was most providential. I believe hundred of lives were saved, under God, by it. The Cholera appeared here soon after we received it. We resorted at once to the Pain Killer, using as directed for Cholera. A list was kept of all to whom the Pain Killer was given, and our native assistants assured us that eight out of every ten to whom it was prescribed recovered. It has proved an incalculable blessing to multitudes of poor people throughout all this region. Our native preachers are never willing to go out on their excursions without a supply of the Pain Killer. It gives them favor in the eyes of the people, and access to families by whom otherwise they would be very indifferently received. Believe me, gratefully and faithfully yours, J. M. JOHNSON, Missionary, Swatow, China.

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

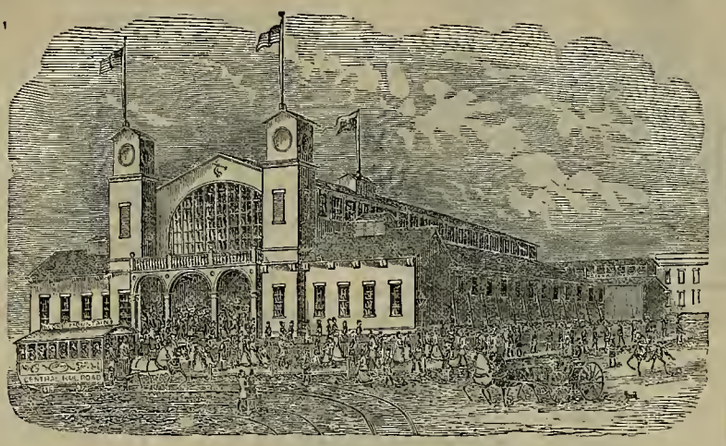
Seventh Industrial Exhibition of the Mechanics' Institute.



Opening Day, Tuesday, September 14th.

The Board of Managers of the Seventh Industrial Exhibition of the Mechanics' Institute announce to the public that the Fair Pavilion on Union Square will open on Tuesday, September 14, at 11 A. M., with the usual ceremonies.

The success of the last Fair was beyond the expectations of the Managers, and the satisfaction to the public was acknowledged by all. In the coming Fair, numerous additional attractions will be presented. Applications for space to exhibit have been received from foreign countries and the Eastern States, and the Managers confidently predict an Exhibition never equalled in California. Steam power will be furnished necessary to drive all machinery.

The Pavilion has been improved in many respects, and now covers an area of 90,000 feet. A new gallery has been erected, and additional decorations will be employed. The Pavilion at night will be illuminated by 1,300 gas jets, presenting a magnificent spectacle.

A celebrated band has been engaged for the entire period of the Fair.

The restaurant and refreshment department will be in competent hands.

Admission:—Season ticket, admitting a gentleman and lady, $5; season ticket, admitting single person, $3; single ticket, 50 cents. Children, half price.

A. S. HALLIDIE, President.

Mechanics' Fair Daily Press---Fourth Volume.

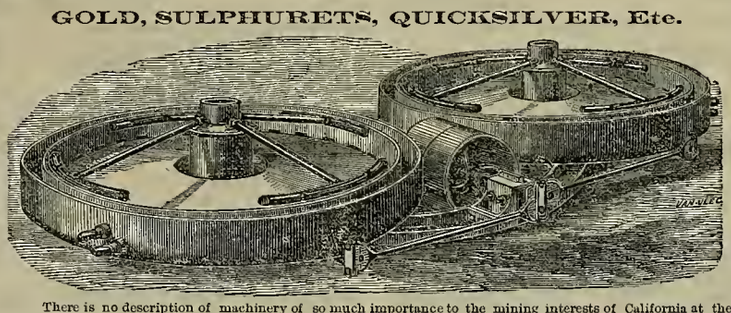
Our three previous volumes have given patrons the best satisfactiou of any advertising medium on the coast. *We have the exclusive privilege for newspaper advertising in the Fair.* DEWEY & CO., Publishers, 414 Clay street.

HUNGERFORD'S IMPROVED CONCENTRATOR,

FOR SAVING

GOLD, SULPHURETS, QUICKSILVER, Etc.



There is no description of machinery of so much importance to the mining interests of California at the present time as that for the separation of sulphurets. Many machines have been tried and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

RECOMMENDATIONS.

San Francisco, October 19th, 1868.

Mr. M. Hungerford—Dear Sir:—We have had twelve of your Concentrators at work at the Oneida Mine, Amador county, for about six months. They give entire satisfaction. They are strong and substantial, requiring, thus far, no repairs, and do their work thoroughly and effectively. At a recent clean-up of four of them, I found that in four weeks' time we saved about $500 in free gold, besides the sulphurets, or not far from one dollar per ton on the entire crushing of the ten stamps connected with them. In my opinion, it is for the interest of every quartz mill to have your machines. Yours, respectfully, GEORGE PRINGLE, Supt. Oneida Mine.

Office of the Oneida Mining Company, Jackson, May 13th, 1868.

Mr. Moroan Hungerford—Dear Sir: In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lamhard, last month, I will say that I put them up in the Oneida Mill soon after I arrived here, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other Concentrators, but these stand up and work better than any others I have used. I have ordered Messrs. Goss & Lamhard to make eight more for me as soon as possible. Very truly yours, JAMES MORGAN.

Bio Oak Flat, May 25th, 1868.—Mr. T. W. Mulford—Dear Sir: I have used two of M. Hungerford's Concentrators in the Rattlesnake Quartz Mill at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Superintendent.

A full description of the principle and mode of action of this Pan is described in circulars, which will be forwarded to any party who may desire them.

The Hungerford Concentrator has only to be seen to be appreciated. No millman will use any other kind after he has tried that. They are in active operation in mills throughout the State, and give perfect satisfaction.

It should be borne in mind that Mr. Hungerford is the

Original Builder and Maker of the Celebrated Prater Concentrator,

and his name should be sufficient guarantee to warrant the public in examining his new Machine before purchasing elsewhere.

In future these Pans will be manufactured by GODDARD & CO., at the Pacific Iron Works, San Francisco, which is a guarantee that they will be built in the most substantial manner.

These Pans may be seen at the PACIFIC IRON WORKS, First Street, near Howard, San Francisco.

Address, M. HUNGERFORD,
9v19-2t San Francisco, Cal.

Resources & Developments

THE farmers throughout the State are busy in harvesting and threshing their grain, and hauling it to various points of railroad and steamboat connection with this city. The terms now offering are very fair, and with the relief to the money market elsewhere noted, we may reasonably look for an increased activity in moving the crop, which is now conceded by all to be much the largest ever harvested in the State. Many who have completed their harvesting are already burning off the stubble and plowing for the next year's crop.

In mining matters a much better spirit prevails between employés and employed than existed a few weeks ago. The miners generally are doing well, and large amounts of bullion are constantly arriving in this city. The labor question in San Francisco is still quite unsettled. The opinion seems to be gaining ground, however, among the laborers themselves that the high price of labor and short hours of work have been carried to too great an extreme. A healthy reaction is evidently in progress, which it is to be hoped will be satisfactory to all, and result in the re-establishment of activity in every department of business and industry.

THE WOOLEN MILLS.—The agent of the Pacific Woolen Mills denies the statement that there has been any intention of stopping those works, and says that on the contrary, the Pacific Railroad is daily opening up new markets for their goods in Utah and other territories, where their goods have not heretofore been called for. This statement is most gratifying. Long may the spindles continue their work.

SASHES AND BLINDS.—Messrs. Hoadley & Co. are building a large sash and blind factory at Nevada, which, says the Nevada *Gazette*, in connection with the general lumber business carried on by that firm, will soon give employment to 300 men. It is only by such and similar establishments that the prosperity of our mining towns can be kept up and increased. Mining alone will not, cannot do it.

VALLEJO seems to be quite an important locality just now. The tenth or eleventh ship for the season is now loading at that port. A foundry is being erected there, with which a large plant of machinery will be connected. Half a million of dollars will be expended there during the ensuing year, in improvements by the Cal. Pac. Railroad Co., and the government will spend a full million during the same time in permanent works at Mare Island. An important discovery of most excellent building stone is said to have been recently made near Vallejo.

COAL AT HAYWARDS.—The search for coal, near Hayward's, by boring, has been resumed at the place where an open shaft was commenced last summer.

SLATE WORKS.—Copperopolis, it is said, bids fair to regain her former prosperity, through the medium of her mines of slate. Large quantities of this material are now being taken out at a point just west of Copperopolis and hauled to Stockton, from whence it is shipped to this city in the shape of tiles for roofing or ground to impalpable dust. There is one good thing about slate—at least it has no mining risks to assume, nearly every day's work being made to pay as it goes. They are also finding good slate in western Calaveras, at which point it is said the slate excitement almost equals some of the gold fevers.

CALIFORNIA CIGARS.—Large orders for California cigars are being received from Salt Lake and Montana, since the opening of the Pacific railroad. Orders have also been received from New York, and large shipments went forward on the last steamer.

SALMON PACKING.—Some of the salmon fishers on the Sacramento have had a large boat built in this city with a house upon the deck in which the fishermen can live, the year round, and change their locality as the fish shift. Much time and expense of seeking nightly shelter will be saved by this arrangement.

BUSINESS AT TUOLUMNE CITY, and on the river, is said to be quite brisk at the present time. The streets of the town are crowded with teams hauling grain to market. The river carries four feet of water up to that place, and steamers as large as the Empire City have no trouble in making regular passages and good time. They are always loaded with down freight.

A NEW STEAMER, called the "Dover," has recently been built by the Cal. Steam Navigation Co. for the trade of the upper San Joaquin. She is already in service, aiding to "move the grain crop."

SOMERSVILLE, CAL., August 25th, 1869.

MESSRS. DEWEY & CO.—Dear Sirs: Allow me to return you my thanks for the very able manner in which you have conducted the business entrusted to your care You will please forward the document (British Patent) by Bamber's Express to this place. Yours, respectfully,
GEO. HAWKHURST.

THOSE 300 mahogany logs received from Central America by Hobbs, Gilmore & Co., are finding a ready sale. ***

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869.—Messrs. A. S. Hallidie & Co., Agents—Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869.—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs A. S Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Thurks, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest size—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

H K Snow	30	120	3 00
K K Snow	31	200	5 00

And in accordance with law, and an order of the Board of Trustees, made on the first day of July, 1869, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, on the thirtieth day of August, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.
THOS. J. OWENS, Secretary.
Office, No. 10 Stevenson Building, San Francisco, Cal. jy14

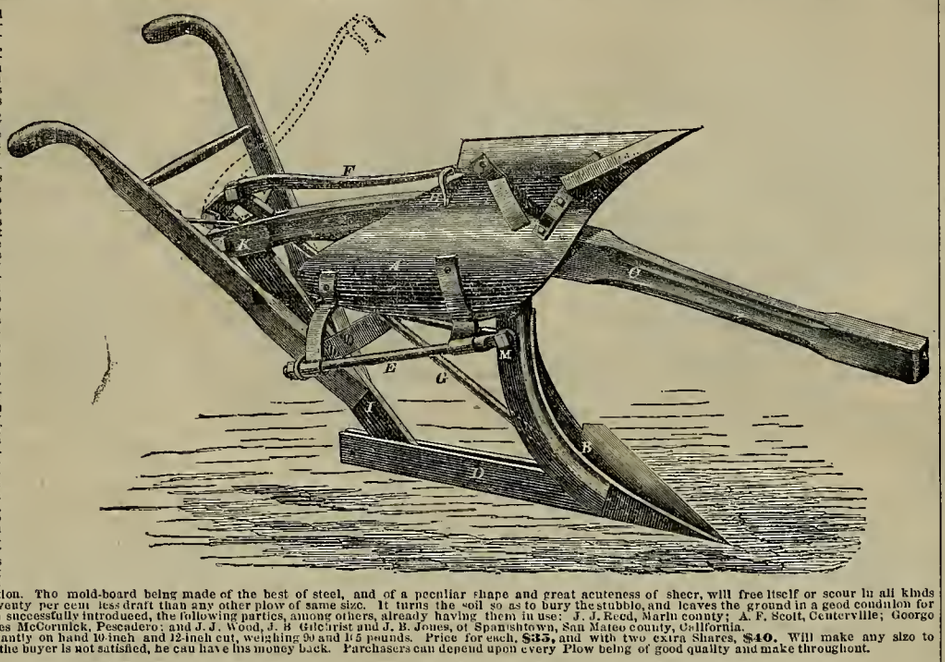
Wells Mining Company.—Location of Works: White Pine Mining District, White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the tenth day of August, 1869, an assessment of thirty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 439 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Friday, the seventeenth day of September, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the seventh day of October, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.
GEO. H. RUSSELL, Secretary.
Office, No. 439 California street, San Francisco. au14

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city contemporaries, while its rates of advertising are reasonably low 10v17tf

SCOVILLE'S CLIMAX SIDE-HILL PLOW.



The advantages claimed for this new Patent California Plow over others employed for similar work, consist in its being so constructed that the plow which is not in use is thrown up in such a manner as to rest its weight upon the beam, as shown in the engraving, where the plow, A, is firmly held by the hooks upon the end of the iron arm, F. The weight of the upturned plow is thus made to aid in keeping the opposite plow to its work in the ground, while the balance of weight is so equally divided as not to give an excess on one side. Its position is also such that it does not in any way interfere with the plowing, and the person who holds the plow can see to handle it as readily as though the mold-board was not resting upon the beam. The handles are so arranged as to give to the holder a sure and easy control of the plow. The rod, G, is operated by the arm or lever, F, so as to lock the plow to be used in its proper position in the standard, by entering a slot in the toe of the land-side, D. When it is desirable to use a single plow (as on level ground) either of the mold-boards may be quickly removed by loosening the nut, M, and removing the rod, E, thus converting it into a single plow. The mold boards are hung upon two angularly-placed axles, one of which belonging to the plow not in use is shown at E, with its mode of attachment to the axis. The plow may also be used double, as for ditching, etc., by slipping a cap over the joint of both plows when in proper position. The mold-board being made of the best of steel, and of a peculiar shape and great acuteness of sheer, will free itself or scour in all kinds of soil, and requires fully twenty per cent. less draft than any other plow of same size. It turns the soil so as to bury the stubble, and leaves the ground in a good condition for seeding. This Plow has been successfully introduced, the following parties, among others, already having them in use: J. J. Reed, Marin county; A. F. Scott, Centerville; George W. Shade, Watsonville; James McCormick, Pescadero; and J. J. Wood, J. B. Gilchrist and J. B. Jones, of Spanishtown, San Mateo county, California.

TWO SIZES kept constantly on hand 10-inch and 12-inch cut, weighing 90 and 115 pounds. Price for each, **$35**, and with two extra Shares, **$40**. Will make any size to order. If, after a fair trial, the buyer is not satisfied, he can have his money back. Purchasers can depend upon every Plow being of good quality and make throughout.

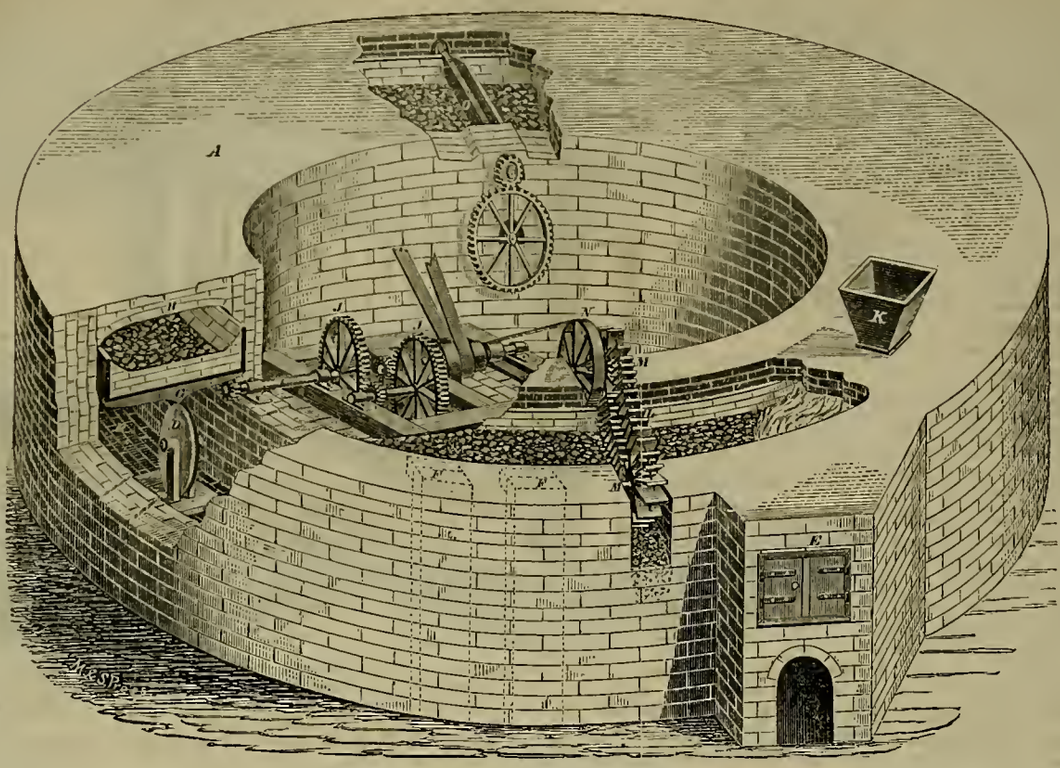
21v17-qy **J. WEICHHART, Proprietor.**

Fred. Ernst's Patent Rotary Roasting Furnace.



This is a mechanical furnace, which does away entirely with manual labor, excepting a fireman. It charges, roasts, stirs, and discharges the ore by a very simple mechanical contrivance,—in fact performs all the operation required in the oxidation or chlorination process of roasting gold or silver ores.

The ore is taken by means of an elevator from the battery, and is discharged constantly and regularly into the hopper, *K*, from whence it reaches the rotating hearth, *G*. This hearth consists of a cast iron orbicular ring paved or lined with bricks, and revolves on a series of iron rollers, *D*, and is kept continually in motion by means of the gearing, *J*. This gearing has two gear wheels, three feet in diameter, and pinions to regulate the speed from the cone pulley, increasing or diminishing it to conform to the required slow motion of the hearth, *G*. The hearth so charged and running constantly carries the ore into the first heat, which is next to the flues, and so passes all the different temperatures of the furnace, thus effecting a very uniform heating and chemical action on the ore; at the same time it has also to pass the stirrers, of which there are different kinds,—stationary and movable ones,—the number and speed of the latter varying according as the ore contains more or less sulphur. The movable paddle stirrers are shown at *O*. These movable stirrers are connected with the gearing under the iron bed of the hearth, *G*, as shown at different points, until it passes the fire-bridge, where it receives its ultimate and highest heat, and is then discharged by the dischargiog apparatus. This discharging apparatus consists of two chain or rag wheels, *M*, *M*. These two chain-wheels drive a double endless chain with inserted plates of iron (scrapers). The chain hanging loose underneath between the wheels draws these iron plates through the cavity of the hearth, and so discharges constantly the roasted ore. To keep the current of air constant throughout the whole length of the furnace, the arch over the hearth decreases slightly from the fire-bridge toward the flues. For concentrated sulphurets it may be advantageous to increase the circumference of the hearth. The advantages claimed as attainable from the use of this machine are—the doing away with a large portion of the costly hand labor ordinarily required, and the better and more thorough accomplishment of the same by machinery. A great saving of fuel, not only through the length of the hearth, but also for the reason that all the gases which are lost by other furnaces are economically employed in this as a substitute for other fuel.

The furnace is so constructed that the large access of air required for the oxidation of the ore, in addition to that demanded for the consumption of these gases, does not operate to materially lower the temperature in the furnace. When the ore in this furnace is once desulphurized, the gases cannot form any new combination with the ores or metals therein, for the reason that while the currents of air and gases are moving to the rear, the furnace hearth is constantly advancing in an opposite direction.

The construction of this furnace is of the simplest kind, and all the necessary castings can be easily transported even on mule-back. The loss of the silver by sublimation in present furnaces, it is claimed, is avoided in this, as the silver condenses before reaching the flues; the distance being great, and the heat diminishing gradually until the gases reach the point of final exit. Liberal terms are offered to parties who desire to use this furnace. Further information can be had by addressing the Inventor and Patentee,

F. ERNST, San Antonio, Lower California, Mexico,

Or by calling upon H. W. SCHMIDT, Druggist, Kearny street, corner of Sacramento, or at this office.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, but one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, **229** Fremont street,

1v1 San Francisco.

REBELLIOUS ORES.

THE HAGAN FURNACE.

The above method for the purification of Rebellious Ores is respectfully offered to the public. Repeated actual workings show that the

HAGAN FURNACE

Will accomplish all that the Reverberatory Process will do, and at an expense that is merely nominal. It has never failed to treat any ore effectually.

It has never been claimed for it that it will extract gold from ores which do not contain any of that metal.

Parties owning rich but refractory veins, can treat with the undersigned upon the basis of

GUARANTEED RESULTS,

With responsible security. For an interview, and all desired particulars, address

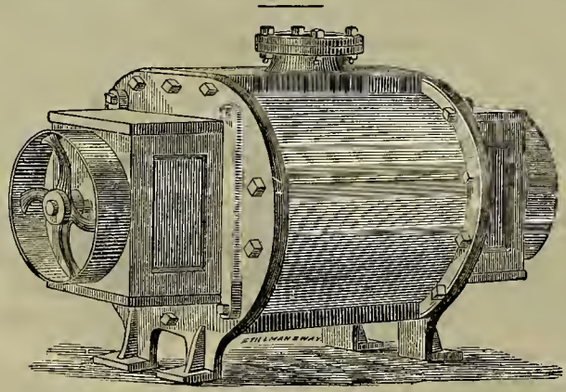
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

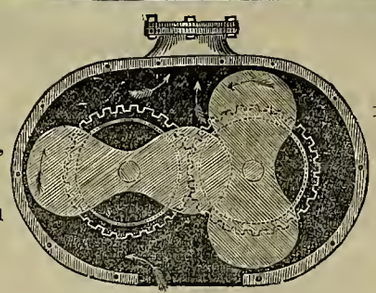
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition,



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

KEEP & BARGION,
Globe Iron Works, Stockton, Cal.

Changing the Address.—No charge is made for changing the address of this paper. To give all necessary information, write us plainly as follows: "Change address of the *Mining and Scientific Press* from Mr. .... at .... P. O., ... County, ... State, to Mr. .... at .... P. O. .... County, ... State. .... 186—."

A New Boot-Jack.—Mr. E. Coleman, of this city, one of our most enterprising and industrious inventors, has made an application, through the patent agency of this office, for a patent for an improved boot-jack, which consists of the old-fashioned wooden jack, with a flap or hinged piece that doubles back, to accommodate space, when not in use; but which, when doing duty, is thrown forward of the fork in which the heel is placed, with a flexible strap or loop, arching over its extremity, into which the toe of the boot is inserted, answering the purpose for which the heel of the other foot is usually employed in removing a closely fitting boot. The improvement consists in the application as above described of this strap, and it is a good one, without which no boot-jack will hereafter be worth house-room.

The California Manufacturing Co. has recently commenced operations at 437 Brannan street, in this city. The object is to manufacture new files of every description, and recut old files, which are warranted equal to new. We learn from Mr. L. Kramer, the business manager, who has lately returned from a traveling tour through the State, that he everywhere met with encouragement, and from the orders received, owing to the increase of this kind of business on the coast, he is fully satisfied as to the future prospects and final success of this new enterprise.

In addition to the file business, they are manufacturing mower and reaper sections, also the knives complete, adapted to all the different machines in use. We understand that Messrs. Wusthoff, Harris and Burke, the other partners, are all practical mechanics. As all work passes under their inspection before leaving the establishment, it is a sufficient guaranty that it will prove entirely satisfactory.

Removal.—The Pioneer Iron Works, Kittredge & Leavitt, proprietors, has been removed from Market street to Beale street, between Howard and Folsom. Their new building covers a good-sized water-lot, 137½x45 feet, giving ample room for conducting their business in future on a much more extensive scale. In addition to the manufacture of iron doors, safes, bank vaults, etc., they build the well-known Bussey Combination Lock, a California invention, which has secured popular favor wherever used.

Continental Life Insurance Co., 302 Montgomery street, corner of Pine.

San Francisco Mining and Scientific Press.—This deservedly popular journal, devoted to the mining, mechanical and agricultural interests of the Pacific coast, entered on its nineteenth volume last Saturday. It is one of the fixed institutions of the country, and every miner in the State should subscribe for it.—*Elko Independent.*

The Fourth Volume of the Mechanics' Fair Daily Press will be printed in the Pavilion, commencing September 14th. It will be distributed free to over **100,000** different persons affording it a wide and immense circulation.

The Fair Press will contain eight pages, with many illustrations and interesting descriptions of articles on exhibition, amusing incidents of the Fair, and will form a very desirable first-class advertising medium. Advertisers will do well to secure their space early.

DEWEY & CO., Prop's,
Mining and Scientific Press, 414 Clay street.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The school is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology, and 7—Select Course.

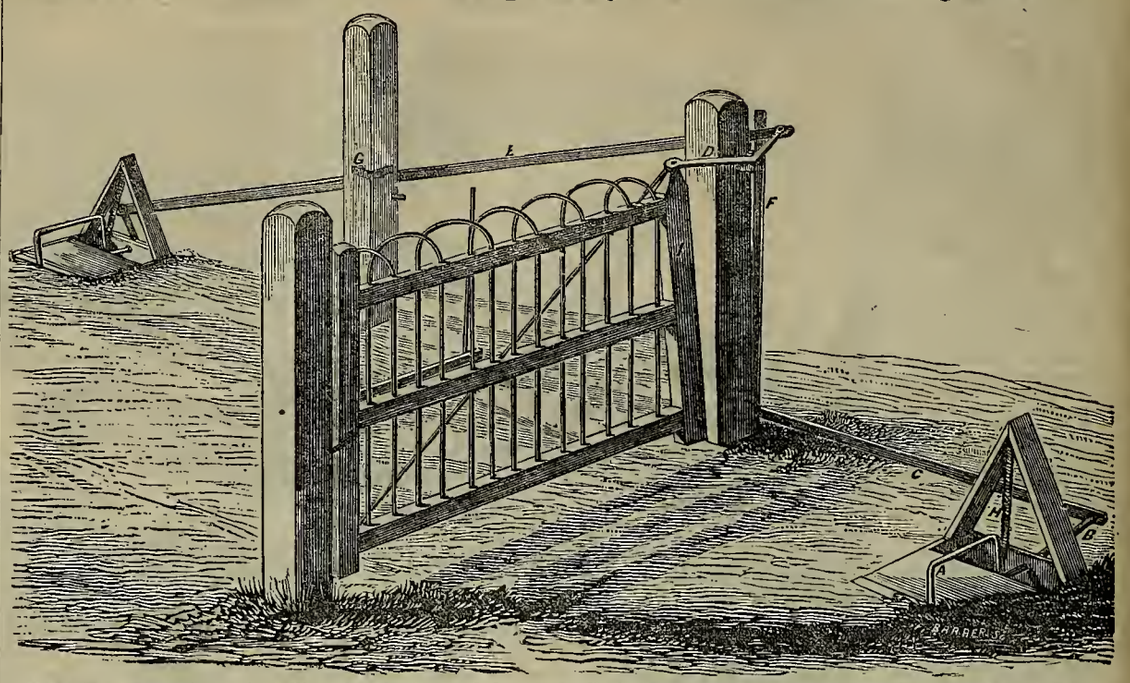
Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

Dickason's Patent Self-Opening and Self-Closing Gate.



We take pleasure in again calling the attention of the public, and especially Mechanics, to this simple and valuable Patent, with the privilege of giving the names and expressions of some few of the persons on this coast, who for several months have been using them, and whose judgment and standing in a business community would seem to entitle them to our confidence. They speak as follows:

I have erected at the Navy Yard, Mare Island, Cal., March 22d, 1869, a Patent Gate, owned by Mr. E. P. Hicks, and known as the "Approach Opener," and am satisfied with its performance. The tests I have made warrant me in saying that I believe Gates of this patent, properly made and suspended, possess all the advantages claimed, and I recommend their use to all who may require them.

Thos. Phelps,
Commander U. S. N., in charge Dept. of Yards and Docks.

Daniel S. Hussey,
Foreman Blacksmith, Yard and Dock Department.

Rooms California State Board of Agriculture,
Sacramento, June 6th, 1869.

E. P. Hicks, Esq.—Dear Sir: Having had a complete trial of your celebrated "Self-Opening and Self-Closing Gate," I can cheerfully recommend the same as worthy of the greatest consideration. No farmer in California should be without it. The ease, simplicity, durability, and cheapness of construction entitle it to the attention of the agricultural community.

Yours respectfully,
Chas. F. Reed,
President State Agricultural Society.

Salem, Oregon, Aug. 14, 1869.

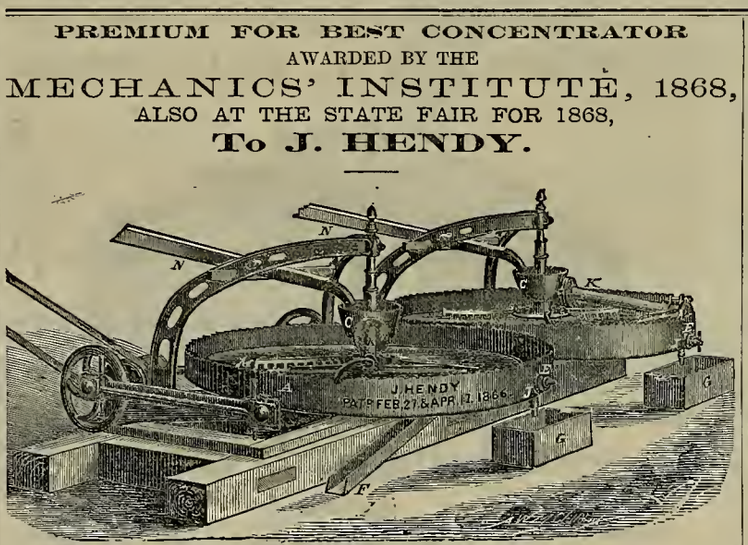
Mr. Hicks:—We take the liberty of inditing you a few lines in accordance with our promise. We have a Gate in operation, and it works like the model.

Yours truly, Dodge & Barker.

Any person wishing information in regard to the Gate, or the purchase of Township or County Rights, will please address

E. P. HICKS,
9v19-11lp **San Francisco, Cal.**

PREMIUM FOR BEST CONCENTRATOR
AWARDED BY THE
MECHANICS' INSTITUTE, 1868,
ALSO AT THE STATE FAIR FOR 1868,
To J. HENDY.



A LARGE NUMBER OF THESE
IMPROVED CONCENTRATORS
ARE IN PRACTICAL USE ON THE PACIFIC COAST.

Mr. Hendy, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice. By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

Office of North Star Mine, Grass Valley, Nov. 12, 1868.

Joshua Hendy, Esq.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.

Respectfully yours, J. H. Crossman, Supt. N. S. Mine.

J. HENDY, Patentee.

The Theory and Practice of Plowing.

[Written for the Mining and Scientific Press.]

EDITORS PRESS:—I beg to submit to your judgment and place at your disposal some remarks on the subject of plowing. The theory herewith given is not mine; but years of experience have proved its value, and as it is not generally known, I have thought it might be of some service to your readers.

There are various modes of plowing as circumstances may require:—such, for instance, as in breaking new ground, in covering manure or grain, etc. I will say nothing of these special cases, but consider only plowing, as it is done in good culture, to "make" the soil. By the word "make," I mean to place it in good condition for cultivation aside from manuring. Farmers know that this end is best attained by proper plowing, pulverizing and mixing the grounds; thus rendering the soil light, and *airing it*, or exposing as many of its parts as possible to the action of atmospheric or other natural agents, such as air, light, heat, cold, rain, hail, fog, electricity, gases of various kinds, etc.; and by such means restoring to the land those productive principles which have become more or less exhausted by continuous cultivation.

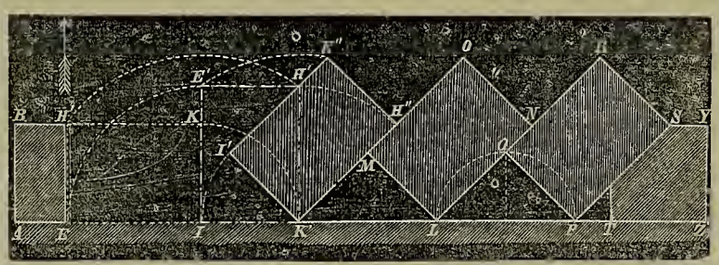
Before commencing to plow a piece of land, the farmer, of course, always decides upon a certain depth of furrow; but the width is generally taken at random, and often too great, in order to do quicker work. It will be hereinafter shown that in the case under consideration the proportion of the width to the depth is not arbitrary.

Let it be supposed that a piece of land is before the reader, measuring one acre, and the depth of the furrow has been ordered at ten inches. Now the question is: what will be the width of the band or furrow that will expose the largest possible surface in our acre of land to the influences of atmospheric agents, and place the soil in the best condition to be acted upon by said influences? I answer, the width must be fourteen inches.

Let us keep in mind that before plowing we have, as we supposed, a surface of one acre exposed to the action of atmospheric agents. Now if we should arrange for the depth and the width of the furrow, so as to take a small depth and a great width, the ground would be turned over, *upside down*, and we should still have only the surface of one acre exposed to the air, light, heat, etc.; and the field would still present, after plowing, a *plane* surface as before.

On the contrary, if the depth being ten inches, we take fourteen inches for the width, the ground will assume quite another appearance, as represented in the annexed diagram, which shows a transverse section taken in our field which has been partly plowed.

This figure is made on a scale of one-sixtsenth of an inch to one inch, and will be readily understood. The line B Y represents the surface of the field before plowing; A Z is the bottom of the furrows; B A is the depth of the furrow, and P Q R S and similar figures represent strips or bands of the soil, which have been successively cut and turned by the plow. A portion of the field is shown as having been plowed, and the various bands in position at P Q R S, L M O N, K′ I′ E″ H″, lie at an angle of forty-five degrees; such lines as O N M L, etc., being equal to the depth of the furrow—ten inches—and O M, N L, etc., representing the width—fourteen inches.



TRANSVERSE SECTION OF A FIELD PARTLY PLOWED.

It may be remarked that the strip K′ I′ E″ H″, lying as it does, the section E H I K, from which it came, ought not to be shown on this figure, as the ground has been placed in its new position, I′ K′ E″ H″, by the plow, the land-side of which has been cutting the land along the line E H. The section E H I K has been left, inclosed by dotted lines, to show how it has been made to turn around point I; the upper point, K, describing an arc of a circle and coming to K′; and so the prism, E H I K, standing up for a moment at I E′ H′ K′, finally reached its ultimate position I′ K′ E″ H″.

Now let the reader consider the present condition of the newly-plowed ground and measure certain lines on this figure. Examine the middle strip, L M O N. It will be seen that when we had, before plowing, only fourteen inches exposed to the air, *on a transverse line* of said band, such as represented by the dotted lines, H K, we have at present both lines, or sides, H″ O and O N, exposed to the same. Each of these lines measures ten inches. We have, consequently, on each land or strip of ground cut by the plow twenty inches instead of fourteen, exposed to atmospheric influences. Besides that, we have, underground, long spaces, or chambers, represented by the triangles K′ M L, L Q P, etc., which chambers allow the air to remain in permanent contact with sides L M and L Q of the band, and also to act on the subsoil, K′ L and L P. Now the sides, L M and L Q are also ten inches long each; so we have in all forty inches exposed, more or less, to atmospheric influences, instead of fourteen inches, as we had before plowing, or as we should have had if the ground had been turned by the plow upside down, as is often done. Comparing together the numbers 40 and 14, we have, by accurate plowing, nearly three times more surface exposed, and that without mentioning the line K′ L of the subsoil.

It may be objected that this figure is more theoretical than practical; but, with all due allowance, I will say that, with a proper plow, certain soils present an appearance nearly as correct after plowing as the diagram, and retain it more or less, sometimes for months. They finally lose it, because the ground is slowly decomposed or disintegrated, and crumbles down into the underlying spaces. But that is precisely the effect sought by the plowing, and is the most effectual mode to air and improve the soil.

It is seen in the diagram that, as we have supposed the depth of the furrow to be ten inches, the surface of our soil, represented by the line B Y, was, before plowing, ten inches above the bottom-line, A Z. Now the highest points of our bands E″ O R are seventeen inches above said line A Z, and such a height (or depth) will afford a good chance, and also time, for the ground to settle down. Water will, moreover, pass through our grounds as through a sponge, and the soil will not pack, because the chambers underneath will prevent that effect, by their allowing room for surplus water; and if heavy rains happen to fall, these chambers will act as reservoirs for a while, affording time for the water to soak slowly below through the subsoil.

Frost is, in certain climates and soils, a very efficient agent in pulverizing the ground and making it slack, as lime does; but for such an effect to be produced the ground must find room for slacking, and it can be seen on the middle band, L M O N, that the portions H″ O and N O will find room for swelling and slacking down into the angular spaces O H″ E″ and O N R, and also that underneath the portions M L and Q L will do the same into the chambers L M K′ and L Q P. Frost will not act underground, it is true, so much as it will at the surface; but the distances M H″ and Q N being in this case only four inches, the action of the frost underground may yet be beneficial.

If these are desirable effects, great advantage might be secured from their acting as effectually and as thoroughly as possible; and for that purpose it would be desirable to have the ground remain as long as possible in the position shown in the diagram, rather than to have it fall down at once.

Let us once more examine the whole structure. The ground is supported mostly on the chambers; and how are those built? It is seen that the chamber K′ M L is a triangle, rectangular at the point M; the basis, K′ L, is fourteen inches wide; the height is seven inches from base to summit, which corresponds, perpendicularly, to the half of the length of the base. The sides, M K′ and M L, are of equal length, and have an inclination of forty-five degrees. Thus the triangle is really constructed in the strongest form for sustaining weight. Its three angles may be conceived to rest on the circumference of a circle, somewhat like an arch, as shown by the dotted lines in the adjoining chamber. Any other form that the triangle might assume by reason of an alteration in the width here ascribed to the band would present *less resistance*.

If we consider, at present, the upper angular spaces, such as E″ H″ O, it will be seen that they are exactly similar to the lower ones. The sides, E″ H″ and O H″, make an angle of forty-five degrees, with a horizontal line. They meet at a right angle, and are equal in length. So they present the best conditions for resisting both the packing of the soil and its too speedy disintegration or crumbling by rain. If these sides should meet under an obtuse angle instead of a right angle, the soil would pack more under the rain, but the water would run down slower, and would have less effect for degrading. If the angle is acute, the soil would pack less; but the rain water would run down faster, and cause the ground to disintegrate sooner and fill up the angular spaces too fast. So our position is a medium one and the best we can obtain.

In a sudden and very heavy shower, if the water accumulates at the point H″, it will not stay long there. The distance, H″ M, is only four inches in the present case, and the water, besides soaking down through the grounds, may also follow the line H″ M, which has an inclination of forty-five degrees, and promptly reach the chamber, thus relieving the upper grounds from too great a quantity of water.

The subject of water must be insisted upon, because that is a most important agent, acting both chemically and mechanically.

After a good "plowing," the ground must undergo an efficient "harrowing;" and it can be seen on the diagram that the harrow will act more effectively on these high crests than it could do on lower ones; and also that the uniformity and smoothness of these crests will insure uniformity and evenness in the work. Grain can also be more uniformly sown, spread and covered on ground so prepared, than on any other.

I close this somewhat lengthy communication with saying, that although to the superficial observer all newly-plowed grounds may look about the same as the preceding figure, the intelligent farmer will closely study this diagram. He knows that from trifling causes great results may originate. He will ascertain the correctness or the unsoundness of this theory, and if he finds out that any other "width" than fourteen inches will present conditions different from those above described and less favorable, he will still retain an invariable rule that for a rational, I might perhaps more properly say *standard*, mode of plowing, *the width of the furrow must be to the depth as* 14 *is to* 10.

North Idaho Quartz Mines.

Written for the Mining and Scientific Press.

Editors Press:—Three weeks since I gave you a brief description of this mining section, though expressed in general terms. Since writiug that acconnt some progress has heen made here in quartz mining. Suffice it to say of the two quartz mills then in operation, that hoth having become encumbered by debt, are liahle soon to change owuers. One of them has been employed in reducing ore from the Rescue lead during the few weeks past, while the other has heen idle. Three arastras have been employed for a few weeks in reducing ores found in the respective vicinity of each. Our millmen have relied too much npon the energy of quartz miners in supplying their mills with custom work, and hence have failed. The uecessary labor has not been performed in the mines to furnish a constant supply of ore at the mills, while the mill owners themselves have had no control of the miues. It is now in contemplation to place the mills and mines uuder one control, and it is hoped that sufficient capital will take hold of the work to give both quartz mining and milling a good degree of success in this camp. I will specify some of the characteristics of the work done upon the veins now partially opened, and the results so far obtained from their ores reduced at the mills.

The Rescue lead now has the most prominence. It was discovered about the middle of last December, but no work was done upon it until March last. It is situated about one mile south of the town of Washiugton, and its shaft is about 300 feet above Warren's creek. The company, consisting of five persons, have 800 feet of the vein. Surface prospecting has revealed a good vein throughout this 800 feet. A shaft seventy feet in depth has been snuk and securely timbered, from the bottom of which levels have been extended east 125 feet and west 85 feet along the vein. Throughout this entire 210 feet of levels the vein has proved to be good and well-defined, with an average crevice of 2½ feet and 18 inches of quartz. In sinking this shaft the vein gradually increased in size and improved in quality. The company has stoped out ahout 250 tons of ore above this level, which has been reduced at the Pioneer mill, yielding upwards of $8,000, or a little more than $32 per ton in gold. The hauling and milling cost $12 per ton. They have also had eleven tons of average ore reduced in an arastra, which yielded $52 per ton. The company seem to prefer the arastra to the mill process, and it is very prohable that they will pnt np several of their own. This mine is the best opened and worked of any in the camp, although much more recently discovered than many others. They employ some twenty-five men, under an experienced quartz miner, with horse-power for hoisting. They have constructed roads, shops, quartz houses, cars aud railways, all snited to their bnsiness, and indicative of a purpose to do permaneut mining. Thus far all has beeu done without the aid of other capital than their own lahor and the money they have taken from the mine.

The Samson is another vein upon which considerable work has been done. In the winter of 1867-8, about 200 tons of ore taken out and worked at the Hic Jacet mill yielded an average of nearly $25 per ton. Since then nearly 200 tons more have beeu extracted and worked at the same mill, and at two different arastras, with an average yield of nearly $40 per ton. The vein improves in depth. The mine embraces only 400 feet of the vein, and is owned by three persons. Their shaft is about 60 feet deep, with a level to the west of 85 feet and to the east of about 30 feet. Most of the ore is stoped from above these levels. The crevice is about 2½ feet, with about 14 inches of quartz. The walls are soft granite, easily wrought without blasting. I am informed that the company intend sinking their shaft to the depth of 60 feet below the present depth as soon as possible, and I think they have good encouragement for so doing. This mine is ahout 400 yards from the Hic Jacet mine.

The Hic Jacet mine embraces but one claim of 200 feet, and is about 300 yards from the mill. About 125 tons of ore have been taken out and mostly worked. The average yield of all the ore taken ont has heen $42 per ton, mostly gold. Their shaft is 50 feet deep, with east level of 25 fect, all stoped out above. At this depth there is a break or fault in the vein, the upper portion having moved northward, down the hill, 22 feet. The company have drifted until they reached the vein, but have done no other work npon it. This veiu, wheu properly worked, will probably prove one of the best in the camp. The crevice is about 20 inches, with about 15 of quartz.

The Winfield Scott is a vein from which about 10 tons of ore, assorted from 15 taken from the mine, was worked, with a yield of $178 per tou. Two shafts are opened upon the mine,—one to the depth of 70 feet and the other 50 feet. From the former shaft and from an open cut to the west of it, most of the quartz has been taken. About 80 tons in all have been extracted, and worked with an average yield of nearly $60 per ton. But so far it has beeu unprofitable, by reason of the hardness of the walls and the small amount of ore obtained. The crevice is about 20 inches, but the average width of the pay ore is not more than six inches. I think when this vein is opened to the depth of 150 feet a much larger amount of ore will be found in the vein, and that it may be made a profitable mine to work. It is situated about three-fourths of a mile from the Hic Jacet mill, with which it is counected by a good wagou road.

The Wm. B. Knott is sitnated about 500 yards from the Hic Jacet mill, and connected therewith by a good wagon road. About 250 tons of ore have beeu taken from this miue, and worked at tho Hic Jacet and Pioneer mills and two different arastras, with an average yield of about $35 per ton. The mine embraces 400 feet, upon which two shafts have been sunk, oue to the depth of nearly 60 feet and the other to about 30 feet. Levels have been run from a point 30 feet down the deepest shaft, both east and west, to a distance of about 40 feet, and the ore stoped from above. The crevice of the vein is nearly four feet, with about 15 inches of solid quartz. The remainder of the crevice is filled with granite and talc.

The Charity vein is situated about two and a half miles to the south of the town, and the mine, which has been worked, embraces 600 feet, and is owned by two companies. One shaft has been sunk to the depth of 70 feet, from which but little quartz has been taken. Several shafts of less depth have yielded considerable ore. Also two tunnels, or drifts, from the surface along the vein, have furnished more or less ore. Ahout 300 tons in all have been extracted and reduced at the Pioneer mill and at two arastras. The average result of the whole, as near as I can ascertain, has been about $25 per ton.

The Keystone vein is sitnated about five miles south of the town and ahout two miles from the *Hic Jacet* miil. ahout 25 tons of ore have been taken from it and worked at arastras with an average yield of $70 per ton. This mine embraces 2,000 feet and is owned by Messrs. Bemis and Sanderson, who also have constructed an arastra mill at a cost of abont $8,000. They are making preparations to open the mine on an extended scale, and to grind the ore at their own mill. I think they will make it highly profitable. This vein contains a good percentage of tellurium, combined with the gold and silver, and the ore requires a different treatment from that of most of the ores in the camp.

Numerous other veins have been tested at the mills with favorable results. Several have heen tested for silver with good results. Among them is the Martinez, which has proved to be the best. But as yet we have not the appliances for working silver ores.

As I intimated in my former letter, we are novices in the working of quartz, and are daily losing money by reason of our inexperience and waut of capital to command the experience and means suited and requisito to the bnsiness. We obtain good results from our ores, but at a heavy cost—far greater than that to which we should be subjected with skill and means for doing the requisite dead work upon our mines. We hope, however, to gain experience in time, and to learn to economize. Many of us may he broken men during our schooling, hut if we can gather strength and means to pay up after we graduate at the school of experience, we will be content.

A. L.

Washington, I. T., Ang. 6th, 1869.

Mining in Indian Valley.

[Written for the Mining and Scientific Press.]

Editors Press:—I have thought that a few notes, showing the progress which is being made in the mines of this district might not be without interest to your readers.

The Crescent Mine and Mill is situated in Indian Valley, Plumas County, about six miles from Taylorville. On visiting this mine and introducing myself to the Superintendent, Mr. M. B. Bransford, I was requested, in company with the foreman, Mr. Peard, to go through and examine the works. We first descended into a very large cut, some seventy-five feet deep and fifteen wide, where I found a very fine vein, known as the Old Horseshoe ledge. The company commenced working upon its surface croppings, on the first of July, and having followed it down as described, have found it to be a well-defined ledge, fifteen feet wide and very rich. Gold could be seen in many places. The mine is very dry. The company have hoisting works some 300 feet from the ledge, and the ore is taken up through one of the shafts and then in cars to the mill. I understand that this company intends to put up new hoisting works soon, between this ledge and their old one. To give some idea of the richuess of the ore in the company's new ledge, I will state that the Superintendent informed me that the cleau up on July 15th, after eleven days' run, was $9,500; and for the eleven days previous to August 1st, it was $10,500. Only ten miners were employed in taking out rock during the time. These two runs, after paying all expenses, netted a clean dividend of $17,500. The company use the common black powder.

The mill, which is a very large and fine one, consists of thirty-two stamps, although only sixteen are used at present. The company is having the other sixteen put in working order, and will soon pnt an additional nnmber of hands into the mine. The engine is a very superior one of 120 horse-power. They are running the mill night and day; but the hoisting works only during the day. The rock is broken up by a large sized Blake's rock-breaker, which does good work. The men employed about these works evinced their appreciation of a good mining paper, by forming a club of twenty to take the Mining and Scientific Press at the club price of $4—every man about the mill and mine joined therein to make up the full number.

Cherokee is a small mining camp, half a mile from Round Valley, where a few mines have been located. Here is the Kittle mine, which I visited, descending a shaft 150 feet to the lower level, in company with the foreman, Mr. H. Gregge. The ledge is a very fine one, from three to six feet wide. The Caledonia is an extension, west, the proprietors of which are doing well and getting out very fine rock. They have very good hoisting works; hut are working only during the day for the lack of hands. The ledge crops out on the side of a hill, into which drifts have been run to strike the same below its croppings. The rock, crushed to date, has paid for all improvements, including a 30 horse-power engine, and left a net balance of $75,000. The owners are Messrs. Judkins & Kellogg. The company has a very fine 6-stamp mill, about half a mile from Cherokee, which is driveu hy a turbine wheel. This mill is run night and day. The ore has to be hauled one mile. This mine was discovered in 1862; but not worked much until 1867. The present Superintendent is George Standart. A club has also been formed at this mine and mill for the Mining and Scientifio Press.

The next visited was the Greck mine, lately taken up, and located on the side of the hill back of the hotel. The company has now a tunuel some eighty feet, and have sunk a shaft sixty feet from the top of the hill, where they find the ledge from four to six feet wide. The rock looks well, and shows a fine prospect when pulverized and panned out. The owners are Mr. George Bellas and J. B. Bachelder. They have been trying to rent the Caledonia mill; but have not yet snceeeded.

This is evidently a promising mining section. I was informed that the Kittle mine was in want of ten men; J. A. Blood's mine, fifteen. The Crescent will pnt on twenty-five men at an early day. Mr. Blood has sent to the Lahor Exchange, in San Francisco, for men.

W. M.

Salt a Necessity.

The following is from one of Dr. Letheby's Cantor Lectures before the Society of Arts, London: "The constant presence of common salt in the secretions, and the necessity for it in due proportion in the blood, indicate the importance of a supply of it with the food. We perceive this in the instinct of animals, and in our own craving for it. Animals, in fact, will travel long distances, and brave the greatest dangers, to obtain it. Men will barter gold for it; indeed, among the Gallas, and on the coast of Sierra Leone, brothers will sell their sisters, husbands their wives, and parents their children, for salt. In the district of Accra, on the Gold Coast of Africa, a handful of salt is the most valuable thing upon earth after gold, and will purchase a slave or two. Munzo Park tells us that with the Mandingoes and Bamharas the use of salt is such a luxury that to say of a man "he flavors his food with salt" is to imply that he is rich; and children will suck a piece of rock-salt as if it were sugar.

The experiments of Boussingault have shown that animals deprived of salt, other than that contained naturally in the food, soon get heavy and dull in their temperament, and have a rough and staring coat. Reulin states that animals which do not find in their food or drink, become less prolific, and the breed rapidly diminishes in number. This is confirmed by Dr. Le Saine, who says, in his prize-essay on salt, that it increases the fertility of the male and the fecundity of the female, and it doubles the power of nourishing the fœtus. During the period of suckling, also, salt given to the mother renders the milk more abundant and more nutritious. It likewise accelerates growth, and gives a finer condition to the skin; and the flesh of animals fed with it is better flavored and more easily digested, than that of animals which do not partake of it. In the experiments of the French Academicians, flesh deprived of its saline constituents hy being washed with water, lost its nutritive power, and animals fed on it soon die of starvation. Even after a few days, with such a diet, the instincts of the animals told them it was worthless as food; indeed, for all purposes of nutrition, it was, as Liebig says, no better than the eating of stones, and the utmost torments of hunger were hardly sufficient to induce them to continue the diet. There was plenty of nitrogenous matter in the food, hut there was no medinm for its solution and absorption, and hence it was useless."

Sulphur and Soda on Deer Creek.—The *Northern Californian* (Chico) says: "Mr. John D. Campbell reports the discovery in a cañon on the banks of Deer creek of large deposits of sulphur and soda. The former is contained in crevices of the rock, and is hard and free from any alloy. The latter is found in and at the mouth of a very large cave. He says hundreds of bnshels of pure soda, white as snow, lie in heaps at the mouth of the cave; while the waters holding it in solution are falling in showers from the ceiling and walls of the cavern."

Food and Exercise.—As a general rule, food which is best enjoyed is best digested. Just so exercise which is most agreeable is usually the most beneficial. In selecting methods of exercise, every individual should be guided by his own individnal tastes. It is better to change frequently from one exercise to another. It is well even to consult our whims and our varying moods; above all things we should strive to prevent our exercise becoming a dry, hard, mechanical rontine. The heart should go with the muscles.

Oil in Tulare.—With the probable early completion of one or more lines of railroad into the Tulare Valley, the oil deposits of that region are again beginning to attract attention. Popular faith in the ultimate realization of profitable oil wells in California has not yet died out. If they are ever found anywhere in the State, we know of no more likely place for them than in the Tulare Valley. The indications on the west side of the valley are well known.

Mechanical Progress.

Progress in Iron and Steel Making.

The work of the whole century preceding the last decade was simply to engraft upon the old processes, a few radical inventions, such as puddling, the hot-blast and the use of manganese. But the last decade has wrought revolutionary changes in the treatment and products of iron. By increasing the height of smelting furnaces from 50 to 100 feet, and other dimensions in proportion, the cost of producing pig iron has been reduced from twenty to thirty per cent. By selecting fluxes in accordance with chemical laws, the impurities in ores heretofore deemed unsuitable are neutralized. The most perfect utilization of fuel by decomposing coal and burning the resulting gases perfectly, instead of burning solid fuel with unavoidable loss, and by saving the waste heat in regenerators, by Siemens' processes, is one of the most useful inventions ever applied in metallurgy. The most radical improvement is the Bessemer process of converting crude pig iron into soft steel by decarburizing and by jets of air. To unprofessional readers the term steel signifies a hard, brittle, elastic alloy of iron, granular and white in fracture, and capable of being hardened and tempered for cutting tools. The hundreds of thousands of tons of Bessemer and other machinery steel annually produced more nearly resembles wrought iron in all respects except structure. It is softer and less elastic than tool steel, as ductile as wrought iron, malleable at a high heat, incapable of hardening sufficiently for tools, gray, and, when very soft, almost fibrous in fracture. But when it is compared with wrought iron the differences are more remarkable than the resemblances. While wrought iron is welded from small, pasty masses of puddled pig iron, and is only freed from cinder by repeated welding, steel is cast from a liquid mass, which from the fact of its fluidity is homogeneous, uniform, sound and pure. The greater part of the cast steel now made is substantially cast wrought iron. If it were hard and brittle like tool steel it would be unfit for rails, axles, machinery, and the thousand uses where it receives violent blows and strains. If it were welded and heterogeneous in its structure like wrought iron, it would—witness iron rails the world over—laminate, wear and deteriorate irregularly and rapidly under great strains. But being both ductile and homogeneous, "low" or "mild," or machinery steel, as made by crucibles, or by the Bessemer, the Martin, or other processes, is exceedingly durable under every variety of strain and wear, and has already wrought a revolution in the proportions and capacity of machinery.—*N. Y. Tribune.*

Machine for Making Metallic Tubes. An invention which is described and illustrated in London *Engineering*, is for making tubes of sheet iron, brass, copper or zinc. Stove pipe is turned out by it at the rate of sixty feet per minute. The tubes are made from flat strips or skelps, with a continuous, longitudinal joint, wherein two continuous edges are lapped and locked together by pressure only. If the statements of the patentees may be fully relied upon, small (1-inch) copper tubes made upon this plan have withstood a pressure of 250 pounds per square inch without leaking, and tubes of iron, zinc, tin, etc., considerable, although less, pressures. The joint can be formed either inside or outside of the tube, so as to present a flush surface on either side as required. The above named journal speaks of this as the invention of an American, and as a promising one.

Another Improvement in Iron Making. Dr. William Field, of Wilmington, Delaware, has invented an improvement in the manufacture of iron and steel. "If,"—says the *Iron Age*,—"all that is claimed for it is true, it is one of the greatest discoveries that have been made in many years." Dr. Field claims that he can make from inferior ores the best quality of wrought iron at a less price than at present the ordinary quality is produced for. He has specimens of iron and steel which show favorably. The process consists in the addition of certain chemicals, costing about seventy-five cents per ton of iron, which remove all the phosphorus and sulphur.

Utilizing Waste Steam without Condensing It.—Mr. R. Meldrum, a Scotchman, has invented a plan for the utilization of the waste steam which has done its work in the cylinder, without condensing it with cold water. It consists of a chamber or chambers (which latter are connected with each other by proper openings) in which fans are mounted, and from which, as well as the boiler cylinder and parts in connection therewith, common air has been extracted, either through displacement or by an air-pump. The steam, when allowed to bear on these fans, owing to their position, will drive them round at great speed, but in accordance with the power of the steam, and there being a sufficiency of the above, the steam will in its progress lose its power until it has none; or, in other words, be received into a vacuum. These chambers by their proper ducts will receive the condensed steam, from which, or other suitable place, it may be pumped back to the boiler.

The Mount Cenis Cars.—Dr. J. G. Holland writes the Springfield *Republican* of his trip across the Alps, and thus notes the central rail: "It is about twice as high as the others. It is grasped by two wheels opposite to each other, under a pressure that makes their slipping upon the iron almost an impossibility. There is no limit to the amount of hugging power which these two wheels may be made to exert upon the rail. This for going up the hill. In going down, the brakes, instead of being applied to the wheels of the engine and the cars, are applied directly to the rail. Two brakes, opposed to each other, are made to hug it so tightly that they can stop a train anywhere, or hold it hanging from a crag in the air, if necessary. The curves of the road are so sharp that it would be impossible to keep the cars on an ordinary track. The cars are short, and made with seats upon the sides, like those of a horse car."

Sudden Cooling or Heating of Boilers.—A writer in the *Locomotive Engineers' Journal* says: "Take a locomotive boiler of ordinary size, it will be nearly one inch longer with steam at a moderate pressure than it was with cold water. If the water is suddenly blown out and the boiler filled with cold water, it will cool the bottom of the boiler first, and the shell will cool much faster than the flues. Now let any one estimate the power that will be exerted on the parts that bear the greatest strain with the top of the boiler one inch longer than the bottom, and the flues longer or shorter, as the case may be." For a similar reason, the blower should never be used with a low fire and little steam. The parts exposed to the fire will expand the most rapidly, and the strain consequently be unequal."

Lacquer for Philosophical Instruments.—We give the following recipe from a new book, *The Painter's Companion*, noticed by us in a recent issue: "Gamboge, an ounce and a half; gum sandrac, four ounces; gum elemi, four ounces; dragon's blood, two ounces; terra merita, an ounce and a half; oriental saffron, four grains; seed-lac, two ounces; pounded glass, six ounces; pure alcohol, forty ounces. The dragon's blood, gum elemi, seed-lac and gamboge, are pounded and mixed with the glass. Over them is poured the tincture obtained by infusing the saffron and terra merita in the alcohol for twenty-four hours; this tincture being first strained through a piece of clean linen cloth."

Steel Weakened by Heating.—"In employing steel for purposes in which the material must be heated for further working, especial attention should be paid to the diminution of strength consequent upon such heating. This diminution, as proved by experiments, is greater in steel than in iron; and in different kinds of steel is greater according as the metal is harder, or richer in carbon."—*Styffe.*

A Monster Cannon.—A new twenty-inch cannon, smooth bore, weighing fifty-seven tons, has lately arrived at Fortress Monroe from Pittsburgh, Pa. It is the largest piece of ordnance ever produced in this country. It will throw a ball weighing eleven hundred pounds.

Scientific Progress.

Filtration no Remedy.

The water of the river Maas, in the Netherlands, which furnishes the chief supply for domestic purposes to several towns along its course, invariably produces diarrhœa in persons unaccustomed to its use. Analyses have not revealed the cause. Filtration has been found of no avail as a preventive. It has been found by Dr. Gunning, of Amsterdam, that the slight turbidity of the water is due to the presence of minutely divided clay, by the aid of which organic matter is kept suspended even after days of rest, and in such fine particles as to pass through a filter. A solution of alum caused after some time a precipitate, which contained organic matter in large quantities. Dr. Gunning discovered that perchloride of iron rendered this water perfectly pure. To one litre of water, 0.032 gramme of the salt, dissolved in water, was added; after being well stirred, it was allowed to settle for 36 hours. No free hydrochloric acid was left; but on the large scale, Dr. G. advises that a small quantity of crystallized carbonate of soda be added before using. At Dr. Gunning's request, a scientific gentleman of Rotterdam has submitted the water to this treatment on a large scale, and arrived at the conclusion, not only that it is thereby deprived of its noxious properties, but that it is an unfailing remedy for the illness caused by the water not so treated. Moreover the same process served to render pure other waters far more foul, which were experimented upon. The proportion of carbonate of soda to the quantity of perchloride of iron above-named, is 0.085 gramme. The city of Rotterdam is to be furnished with large water works, in which this treatment is to be adopted on the large scale.

New Assay Weights for Gold and Silver Ores.—Professor Chandler describes his new system of weights in the N. Y. *Mining Journal.* We give the plan upon which the system is based:—"The ton of 2000 lbs. contains 29,166 troy ounces. If we use 29.166 grammes of ore in our assay, every milligramme (0;001) of precious metal obtained will be equal to 1-29166 of the ore, which will be 1 troy ounce in 1 ton of 2000 pounds. This is the starting-point in the new set of weights. A weight of 29.166⅔ grammes is our assay ton, and a milligramme obtained from the *assay ton* of ore is an *assay troy ounce.* We have only to write milligrammes as units to have our weight of precious metal in troy ounces per ton. Thus: a sample of gold quartz yields from one assay ton 0.00277 gold, 0.00054 silver. Moving the decimal point to make the milligrammes read units, we have 2.77 ounces gold and 0.54 ounces silver per ton.

Effect of Induction Currents upon the Amœba.—This formed the subject of a paper by M. Engelmann which was presented to the Royal Academy of Sciences of Amsterdam at a late meeting. When the current is feeble, there is an arrest of the granules, but no change of form. In about five seconds the normal conditions are restored. If the excitation is moderate, there is immediate arrest of the granules, and in about three seconds, contraction. If the irritation is powerful, there is immediate arrest of the granules, and immediate contraction. The phenomena in the last case last about two minutes.

Identity of Caffeine and Theine.—M. Hager found that the physiological effect of these two substances, in equal doses, and under the same circumstances, is by no means the same; although chemical analysis proves them to be absolutely identical. Here is shown the difference between the delicate workings of the stomach laboratory, and those of the scientist's chemical re-agents.

Condensing of Magnetism.

M. Jamin has presented a paper to the French Academy, detailing his experiments upon this subject. Having had a large horse-shoe magnet made, consisting of ten laminæ of homogeneous steel, each weighing 10 kilogrammes, he suspended it to a book attached to a strong beam, and having wound copper wire around each of the legs, which were turned downwards, he put the latter in communication with a battery of 50 of Bunsen's elements. There was, further, a series of iron plates, which could be separately applied to each of the laminæ. Before attaching any of the latter, the electric current was driven through the apparatus for a few minutes, and then interrupted, whereby the magnet acquired its first degree of saturation, marked by a certain deviation of a small horizontal needle. One of the iron plates—"contacts"—was then put on, and it supported a weight of 140 kilogrammes. A second trial was now made; and the current having passed through again for a few seconds, it was found that the horse-shoe would support 300 kilogrammes, instead of 140. The number of contacts being now increased to five, it was found, that they could support 680 kilogrammes,—which they did for the space of a full week. No sooner, however, were the contacts taken off, than the horse-shoe returned to its usual permanent strength of 140 kilogrammes.

Desmids and Diatoms.

The following is from an article in the last *American Naturalist*, by Prof. Arthur M. Edwards: "The Desmids have had this designation applied to them on account of their being made up of two aymmetrical halves, united together by means of a band or bridge. They are very beautiful when examined by means of powerful glasses. In a few instances this bilateral symmetry is not so evident as in others, or even seems to be entirely absent. External warty or spinous protuberances, or processes, are very commonly present, and then the outline of the plant is of great beauty, the green cell-contents, made up for the most part of the same material as constitutes the coloring matter of the leaves of larger plants, and there called chlorophyl, but in the Desmids known as endochrome, causing them to appear almost like brilliant gems of great purity of tint and configuration. In some cases no such external projections are present, but yet the outline of the cell is, nevertheless, extremely graceful. In the Diatoms the cell-wall is strengthened and supported by having deposited within it a mass of silicious material which then becomes marked with wonderfully fine tracings and sculpturings; but in the Desmids no such stony and indestructible substance is present, stiff cellulose only constituting the skeleton of the plant. Hence we do not find the remains of these organisms occurring fossilized in the older strata of the globe as is very commonly the case with the Diatoms."

A New Jelly-Fish.—Prof. Verrill describes in *Silliman's Journal* for July a beautiful jelly-fish discovered by himself and companions during a recent excursion to the coast of Maine. It is,—he says,—the type of a new genus, and represents a family previously unknown upon the Atlantic coast. It is large in size and yellowish in color. The tentacles are about eighty in number; and in large specimens may extend fifteen or twenty feet. They are scalloped on one edge, and margined with white. The largest specimen was eighteen inches in diameter. Prof. Verrill has named it *Callinema ornata.*

The Moon's Heat.—The Earl of Rosse is experimenting with a thermopile and telescope to determine what proportion of the moon's heat comes from its interior, what proportion falls from the sun on the moon's surface, and is reflected, and what proportion is absorbed. The last raises the temperature of the moon's surface, and is afterwards radiated.

Farming and Gardening.

Something about Barley.

A warm, rich, kind soil is best adapted to this cereal. A sandy or stiff, cold clay or any worn out field is unsuitable for such a crop. Soil for barley should be well cultivated—plowed deep. Early sown barley is generally heavier than late sown. In rotating, barley is a good crop to follow potatoes; any soil well adapted for potatoes is good for barley—Barley does not do as well on freshly turned sod, as on that which has been previously cultivated. As a general thing barley is the easiest and surest of all grain crops to cultivate and harvest. It ripens early and may soon be turned into cash. It has been sown, grown, harvested, and the money from the product invested, within ninety days time. Barley takes but little from the soil—less than oats, much less than wheat. For this reason ground which has been sowed with this grain, is good to follow with almost any crop. For this reason also it is good to sow with grass. It gives clover and timothy as good a chance as though its thin stalk was not intermixed with them. While it shelters and protects the slow and early growth of the grass, it is soon out of their way entirely.

Barley is more variable in price than any other cereal, and for that reason is not as desirable as wheat for extensive cultivation. It is better for farmers to raise it only in small quantities, as a bye-product. If the price is low use it more freely on the farm. It makes excellent food, no matter how you use it. When properly ground and bolted it is not bad for the table. If the reader doubts this statement let him try some barley griddle-cakes. Barley contains a large proportion of nourishment.

Bright, clean barley straw is much relished by cattle,—while nothing is better for them than barley meal. Hence, if the crop is so abundant that the beer makers—its chief buyers—cannot be compelled to give you a fair price for it, you can turn the surplus to better account by converting it into beef, or pork, or eggs.

Barley is frequently imported into the United States. In 1868, some 200,000 bushels were imported from England, chiefly for distilleries in Chicago, Cincinnati, and other western cities; while in 1867, the home supply being ample, not a bushel was imported. The usual cost of British barley for malting is from $1.50 to $1.62½. The British grain is considered superior to the American for such use.

The natural classification of barley is by the ear, into three kinds—two-rowed, four-rowed and six-rowed. By the grains, it is classified into two kinds—the *bere*, or *big*, and *barley*. The bere, or big, is four-rowed—the barley two or six-rowed. The grain of the former is mainly distinguished from the latter by having its radial line so traced as to give the grain a twisted appearance, by which one of its sides is somewhat larger than the other. The grain of the latter is divided by a straight medial line into two equal parts. Its grain is also smaller than the former, though more plump and heavy. The two and six-rowed are the varieties generally cultivated. The former is preferred by many, especially in the Middle and Western States, from the fact that it is a larger grain, weighs more to the bushel, and may be sown thicker on the ground—say as two and a half bushels of the two-rowed to two bushels of the four-rowed.

A California Farm.—The present year's yield of the farm of Mr. Bidwell, of Chico, in this State, has been 35,282 bushels of wheat, 10,300 of barley, 900 of oats, 300 tons of hay, besides eleven acres of corn not yet harvested. The yield of grain this year has been 2,200 bushels in excess of last.

Facts About Cattle.

It is a well-established fact that all domestic animals may be greatly improved in size and value by careful breeding and culture. One hundred and fifty years ago the average weight of cattle (heeves), at the great English Smithfield market, did not exceed 370 pounds, and that of sheep twenty-eight. Now the average weight of English beeves is over 800 pounds; while sheep have increased to eighty.

The average weight of cattle brought to the New York market is about 700 pounds—of sheep fifty. California cattle greatly exceed in weight either of the above; how much, we are unable to say. If any records have been kept, it would be interesting to compare them with the above.

Careful records kept by agricultural fairs in Maine, have shown that there has been a gradual increase in the size of neat cattle in that State, by improved culture, which already exceeds a foot in the girth of working oxen. The improvement in the quality of horses has also been very rapid and marked, in that State.

Experience shows that animals with small stomachs require concentrated food—those with large stomachs do best with coarse food. Horses and oxen have large stomachs; hogs and human beings have small ones.

An experienced wool grower says that if sheep are kept in the same lot with a few fat or good-conditioned cattle, no dog will injure them; for as soon as the dogs approach the sheep, they instinctively run to the cattle for protection, who at once unite in driving off the dogs. The farmer who communicates the above to an eastern exchange says he has practiced this plan for thirty years, and has never lost a sheep by dogs; while his neighbors, on all sides, who do not use this caution, have suffered severely from the dog nuisance.

To Skin Peaches.—The skin should never be removed from peaches by paring; a better way is to make a weak lye—say by adding two quarts of ashes to four quarts of water—place the same in an iron pot and bring to a boil. While the liquid is still hot, place therein about a dozen peaches and take them out as quickly as possible (using a skimmer) and drop them into cold water. The skin will then slip off without trouble, when they should be dropped into another vessel of clear, cold water, to remain until wanted to cut up or can; either of which should be done as soon as possible after the skin has been removed.

Cause of the Decay of Orchards.—There are numerous reasons for the often seeming unaccountable decay of orchards. Among other causes than the exhaustion of the soil from constant crops for the production of such a result, may be mentioned the blowing away of the leaves, by the fall of which nature designed to feed the soil in which the tree stands and the taking away of crops of grass,—grain or roots, without any remunerative return of manures. The whipping of the limbs with poles, to remove the fruit is also a material injury to the trees. Improper trimming is often a cause of serious injury. The pasturage of any stock other than hogs, in an orchard, is also a great injury. Hens as well as hogs help to kill the enemies of the trees.

Vegetables and Fruit from Bermuda. A large steamer now runs regularly between New York and the Bermuda Islands, bearing to that market the earliest onions and potatoes, and thousands of bunches of the finest bananas, etc., and carrying back such merchandise as is needed at the islands.

Santa Cruz Products.—The annual product of lumber, of all kinds, in Santa Cruz County, is set down by the *Sentinel* at 20,000,000 feet. The value of lime produced $360,000; leather, $250,000; powder, $500,000; butter and cheese, $15,000.

California Hams and Bacon.—It is said that the best hams and bacon made in California are from mountain hogs. The principal firms engaged in this business are Cashin & Kent, of Grass Valley; Garrecht & Co., of Shasta; Phillips & Chandler, Red Bluff; and Heitzig & Co., of La Porte. These four firms alone slaughter about ten thousand hogs per year, relying on Idaho and Nevada for a market. The large packing house of Wilson & Stevens, of this city, supplies the army and navy of the whole Pacific Coast, with pork, and for that purpose slaughters seven thousand head per annum.

There has been some talk about erecting an extensive packing establishment on the line of the Pacific Railroad, near the summit of the Sierra Nevada where the snows continue almost through the entire summer, producing a temperature extremely favorable for such a business. The hogs might be raised and slaughtered anywhere along the line of the road, in the foot-hills or valleys.

Hydraulic Power in Flour Packing.—Flour for the use of the French army is packed, by hydraulic power, in tin cases, and so compressed as to be impervious to damp or mould. Great saving is thereby made in storage, while the flour is said to keep better. It is stated that this idea originated with the Emperor himself, who ordered experiments to be made, which resulted in a complete success. Why might not flour be put through a compressing machine, something after the manner of pressed brick, and the expense of freightage and handling be thereby materially reduced?

Imported Cereals.—Commissioner Capron, of the Agricultural Department, has received gratifying information in regard to several important cereals introduced by him from Europe last year. Among these, the white Schomen oats promise to be a great acquisition; also the white Tappahannock wheat, a plump, white grain, which makes excellent flour, and, being ten to fourteen days earlier than any other variety, escapes the ravages of the fly. As it succeeds well in all parts of the Union, its general cultivation, it is thought, will have an important bearing on the aggregate and quality of the wheat crop. The Commissioner is anxious that all farmers to whom seeds have been sent the past season should report to the Department the results of their experiments.

The Grape Crop—Short Yield.—The *Alta*, in speaking of the present season's grape crop, says: "Notwithstanding the fact that at least a million of vines have came into bearing this year, and twice as many others, on account of increase of age, will bear twenty per cent. more than they did last year, the grape crop of 1869 will be less than that of 1868. This season follows one of extraordinary production, after which a small or moderate crop was to be expected. A very large yield always exhausts vines, and they need a twelvemonth to recover. The bunches which were blistered by the sun, some weeks ago, may be regarded as lost. The mildew or oidium has appeared in many vineyards, and has not been checked by the application of sulphur, as it might have been. Next year more attention must be given to the matter, or serious loss may result. It is said that there is no mildew on the leeward side of dusty roads. The dust seems to have the same preventive and curative influence as flowers or sulphur. The oidium first shows itself in little black spots on the new shoots; and as soon as these appear, the remedy should be applied. The grape fly is doing some damage in Sonoma."

The Wine Crop of Europe, reckoned at only twenty-five cents per gallon, aggregates over $800,000,000, annually, and is produced from 12,200,000 acres of land.

Frost in Valleys.

When any portion of the air is cooled it becomes heavier than the surrounding atmosphere; and, if this occurs upon a hill-top or side, the cooler air immediately runs down the slope, and forms, as it were, a lake of cool air in the valley, the warmer air rising to give it place. This is of very common occurrence, from the fact that hills are more exposed than valleys to winds or moving currents of air, which are generally cooler than still air. The coldness of the air in valleys is also still further increased from the fact that the dark and porous soil which is generally found in such localities radiates heat faster than the gravelly and more compact soil of the hills. A knowledge of these facts should teach the farmer the importance of selecting elevated places for fruit trees or any other crop liable to be injured by the frost. They also explain the reason why the muck or peat of drained swamps, or other similar land, is more subject to frosts than sandy or gravelly soil at the same elevation and subject to the same exposure.

Corn, especially in this State, where the nights are always cool, should never be planted in the lowest part of a valley; for in such locations it is more liable to be injured by early and late frosts.

The city of San Francisco is greatly diversified by hills and valleys, affording frequent opportunities for noticing the phenomena alluded to above. The moisture in the atmosphere of the lower portions of the city is often so much condensed as to render the streets and sidewalks there quite wet; while the pedestrian, by walking up the slope of any neighboring hill, will soon find himself treading upon a perfectly dry pavement. The white hoar frost, sometimes seen in this city in spring and autumn, is almost exclusively confined to its lower portions.

People in a rolling country will often notice in the early morning little isolated patches of fog here and there over the land. That fog covers precisely the localities which would be occupied with water if the country was partially submerged by that element, and those localities are the ones where frost is sooner and latest seen. Farmers should notice and carefully mark such localities, and avoid planting therein any fruit or vegetables which are liable to be injured by light frosts.

Sugar from Pumpkins.—An excellent quality of sugar is made from the common field pumpkin, in Hungary, where several large factories have been in operation since 1837. The process is the same as that employed in the beet sugar manufacture.

What Careful Cultivation will Do. An English farmer, by picking over his seed-wheat with the utmost care, and planting a grain in a place, at intervals of a foot each way, produced 162 bushels to the acre.

The Japanese Colony, near Placerville, is said to be progressing in a most satisfactory manner. The tea and mulberry plants are flourishing finely. The remaining members of the colony, 200 in number, will soon arrive from Japan.

Imported Sheep.—The Butte *Record* says that Mr. G. L. Hamlin has recently returned from the East with nine Cotswold Sheep, two of the Lester and one of the Lincoln breed—all fine animals.

Big Beet.—Santa Barbara has produced a mangel-wurzel beet, this season, which weighs 51 pounds.

The Light of Uranus.—This planet emits light which differs from that of any other of our system. According to Father Secchi, its spectrum exhibits broad absorption lines. The surface modifies the sun's light which it reflects, in the same manner as do colored bodies.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, September 4, 1869.

Financial.

Our financial condition has been considerably improved during the past week, and money is no longer unobtainable. Coin disbursed in the interior for domestic produce is beginning to find its way back to be employed again, and bills of exchange for exported grain are becoming quite plentiful. Savings Banks deposits are on a larger scale and the market has greatly recovered from its late stringency. The election interfered greatly with all kinds of business, but the spasm being over, trade and finance will resume their normal channels. Material reductions have been made on the price of passage between this city and the East, and there is good ground to hope for a large and valuable additiou to our population.

The Pacific Mail Steamship Company now charges but $100 in the first cabin and $50 in the steerage, the second cabin arrangement having been dispensed with. The Union Pacific Railroad and the other Eastern railroads connecting with it at Omaha, have not acceded to the proposition of the Central Pacific Railroad to place immigrant cars on the route and fix the rate of passage at $50 in currency, but have agreed to reduce fares on second class cars to $45, coin, to Chicago and $55 to New York, while the charges on first class cars have been reduced to $97 50, gold, to Chicago and $112 50 to New York.

Real Estate transactions for August, according to Carter's *Circular*, were as follows: number of sales made, 375, representing $1,139,416; number of mortgages effected, 245, involving $861,690; number of releases, 118, amounting to $389,243. We quote the following from the same authority:

A few days ago, two Germans, who desired to secure a tract of 10,000 to 75,000 acres of land, called upon us. They had been appointed a committee by a number of their fellow-countrymen, who desire to secure a large tract of cheap rolling land, upon which they intend to form a German settlement, somewhat similar to that of Anaheim.

We are informed that a tract of 10,000 acres of land, situated on the southern border of Monterey County, near the old San Miguel Missiou, was lately purchased from the Government, by a land speculator, for $1 25 per acre. This tract is now partially used as a sheep range. But for scarcity of water it would he well fitted for that purpose. Even as it is, nearly one-half of the tract is suitable for grain-growing. Heretofore it was deemed impossible to raise grain on the dry Salinas Plaius. This season, however, a spaco ten miles square was planted in wheat and barley. The experiment has been successful, the grain having come up well, greatly to the surprise of the wisecares of the vicinity, who knew in advance that the experiment would be a failure.

Bullion is in rather light supply and the demand somewhat active. Gold bars are quotable at 850@860; silver bars sell from par to ½ per cent. discount; currency hills on Atlantic cities pay 31½@32 per cent. premium on gold; coin drafts, payahlo at sight, ¾ per cent. premium; telegraphic transfers, 1@1¼ per cent. premium; sterling exchange, 48¾d; commercial exchange, 49¾@49½d; Mexican dollars, 6½@7½ per cent. premium; gold in New York, September 3d, 135¾; legal tenders in San Francisco, 73¾.

The near approach of our regular rainy season will give Eastern visitors an opportunity to enjoy our climate under its most delightful condition, and impart a sense of gratification that will probably result in sending thousands to us instead of to Cuba and Europe during winter. We have always entertained the opinion that facility of transportation was the only thing needed to render California the coveted winter ahode for the wealthy classes of ice-hound Eastern localities. Invalids will also seek it with the same avidity they have heretofore sought southern Italy. One winter passed in this State will settle the question for thousands, and must result in great benefit to all classes of our trades people.

The exports of Treasure from Aug. 1st to date have been as follows:

Aug. 4—Per Oregonian—		
To China	$346,913 30	
To Japan	326,403 93	
		673,377 23
Aug. 1 to 5—Overland to New York		63,246 65
Aug. 9—Per Sacramento—		
To New York	$ 48,047 15	
To England	448,887 83	
To Central America	161,625 42	
To Panama	20,000 00	
		679,660 40

City Stocks.

For the week nnder review we noto sales of North Beach and Mission Railroad at $69. The usual monthly dividend of this company was paid on the 1st inst.——San Francisco Gas stock realized $83@83 50. The usual ½ per cent. dividend was disbursed on the 1st.——California Steam Navigation Co. at 53 per cent.——Spring Valley Water Co. at $61 per share.——Twenty shares of Pacific Insurance Co. stock sold at $110 per share.——The Pacific Bank dishursed its usual dividend of 1 per cent. for the month just closed.

Mining Share Market.

During the period intervening since our last reference, the mining share market has improved considerably, and the sales making were quite large; however, a general apathetic feeling pervades the market, through the scarcity of available cash means with which to operate. Both in the Comstock and White Pine claims nothing has transpired to produce greater activity and better prices, though their intrinsic merits seem to warrant an improvement.

HALE & NORCROSS—sold at improved prices. For the week ending August 28th, the upper mine yielded 264½ tons of ore, and the lower 1,078½, making a total yield of 1,342½ tons. During the same time they delivered 821 tons for reduction, keeping on hand at the dump 1,294½. In drifting westward on the fifth floor of the fifth level, fifty feet south of the northern boundary line, they have reached the west vein, hut owing to the flow of water were compelled to stop and allow it to drain off. The character of the vein has not yet been ascertained. In the upper mine they find great difficulty in opening the 600 level, being more difficult to work than new ground. On the 400 level they continue to sink the winze, having carried it down fifty feet, the average width of vein being 2½ feet, and showing average assays for the week of $70 to the tone. The north drift on the vein, same level, continues without change.

CHOLLAR-POTOSI—was in the market to a considerable extent at a slight improvement. During the week ending August 27th, they extracted 1,540 tons of ore, of which amount the Blue Wing stope contributed 1,000, the New Tunnel 237, and the Grass Valley 253 tons. We learn of no change in the Blue Wing, while the New Tunnel shows a good quality in the northern portion, and the Grass Valley considerahle improvement. On the 27th, $33,828 in hullion was sent forward to this city.

GOULD & CURRY—has been in slight request. During the week ending August 30th, 265¾ tons of ore were taken from the upper chambers of the mine, which gives an average assay of $39 20 per ton. The second station drift is within fifty feet of the shaft that connects from the main adit, which will shortly ho completed, adding considerably to the present production of the upper levels. At the seventh station the drift going southeast is in 45 feet, with no change in the material. They have started a drift northward. The hullion receipts to date for the month of August nggregate $18,573.

OPHIR—is quiet. The drift is going ahead at the rate of two feet per day, running in hard rock. On the 30th of August it had attained a distance of 663 feet.——OVERMAN is less active than last week. For the week closing August 28th, 262 tons of ore were extracted, showing an approximate value of $5,240, or $20 per ton. They had on hand at the dump 385 tons.

In White Pine stocks there is not much doing. From the *News* of August 28th we cull the following:

AURORA CONSOLIDATED.—Having come into possession of the Earl mine by purchase during the last week, this company is now shipping a large quantity of high grade ore from the Earl shaft. This is an important addition to the property of the company, and cannot fail to enhauce the value of its stock.——CONSOLIDATED CHLORIDE FLAT has increased its working force to 125 men, and is now sending 50 tons of ore to mill daily for reduction.——ECLIPSE CONSOLIDATED has struck a body of high grade ore 12 feet thick, in their shaft, at the depth of 112 feet. A drift has been run several feet eastward, revealing an excellent quality of ore; and next week drifts will be run in other directions, to ascertain the course of the vein. This is a horizontal vein, with a good hottom or foot wall, inclining slightly to the south. This strike is considered the most important development made here for many months, indicating, as it does, greater depth and permanency to our mines than many are willing to believe.——INDUSTRY continues taking out some very good ore. The usual number of men are employed. About 30 tons of ore shipped the 6th. A dividend of $4 per foot will be paid on and after this week.——MAMMOTH is employing 13 men. Its fine vein, 5 feet in thickness, is being worked in the east shaft. The work is also progressing in the Shehoygan incline, and some very good ore coming out.——VIRGINIA is taking ore from the north chamber only, hut that is of a very high grade. The Newark mill is now engaged upon ore from this mine, the pulp of which assays much higher than the ore milled last month.——ORIGINAL HIDDEN TREASURE levied an assessment of $2 per share on the 28th of August last.

STAINING WOOD BROWN.—Dr. Stozel first paints over the wood with a solution made by boiling one part of catechu (cutch or gambier) with thirty parts of water and a little soda. This is allowed to dry in the air, and then the wood is painted over with another solution made of one part of bichromate of potash and thirty parts of water. By a little difference in the mode of treatment, and by varying the strength of the solutions, various shades of color may be given with these materials, which will be permanent, and tend to preserve the wood.

Weekly Shareholders' Directory, for Meetings, Assessments and Dividends.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Sept. 3, 1869.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

		Per ton.			Per ton.
12	per cent. ore	$16 00	22 per cent. ore		$43 56
13	" "	18 62	3 " "		46 45
14	" "	20	20 24 " "		49 33
15	" "	23	25 25 " "		52 22
16	" "	26	2 26 " "		55 11
17	" "	29	12 27 " "		58 00
18	" "	29	91 28 " "		60 80
19	" "	34	90 29 " "		63 77
20	" "	37	78 30 " "		66 66
21	" "	40	67 31 " "		69 55

These prices, we believe, will be found substantially correct, and can be realized at this date.

Do you admire Elise Holt? Have you examined her features through one of Muller's opera glasses? If you have not, you have no right to pronounce an opinion.

***

CENTRAL AMERICA Mahogany has been introduced here by Hobbs, Gilmore & Co., being found cheaper than the Eastern.

***

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Pennsylvania.—*Chronicle*, Aug, 21st: The annual report of the Supt. closes thns: "I believe we now possess a good mine, and see no reason why the Company shonld not make an exertion to procure a mill as soon as possible."

Globe.—*Miner*, 21st: In this tnnnel the back-set occasioned by the cave is now overcome and some good developements are daily expected.

CALAVERAS COUNTY.

Coffee Mill.—*Chronicle*, 28th: We have been shown a couple of nnggets from the Coffee Mill claim, weighing $21 and $28. These are the first "indications" that the mine contains coarse gold. Mr. Gleason informs us that the first "clean up" resnlted satisfactorily. The "incline" has been retimbered throughout. Mr. Gleason is employing a large nnmber of hands.

Good "Clean Up."—One hundred and nine ounces of gold were taken from one sluice hox in Clark'a great hydraulio claim in Railroad Flat this week. There are 300 boxes in the claim.

KERN COUNTY.

Rich Discovery.—Havilah *Courier*, 17th: Mr. S. O. Remington gives ns intelligence of a discovery made by him, six or eight miles from Sageland. The lead is from four to five feet in width, and contains both gold and silver.

NEVADA COUNTY.

You Bet.—*Transcript*, Judge Brown is working two shifts and running night and day. He is employing 16 men and is taking out ahout $2,500 per week. Neece & West are running a bedrock tnnnel in order to get the proper fall to work the blue lead, and are getting along finely. They let off a hlast last week of 280 kegs powder, and it did its work beautifully. The prospect is now that these claims will pay better than they ever did before. Ed. Williams is rnnning a bedrock tunnel, and expects to get it completed this fall. He is employing 20 men. W. H. Duryea is also repairing his claims for winter, and the prospect is that You Bet is going to he very lively.

Little York.—Little York Co. are running three sets of hydraulic claims, and using 250 inches of water per day. They give employment to 60 men, and are taking ont on an average $3,000 at each run of ten days. These claims are owned hy W. W. Cozzens, of You Bet, and Mr. Briggs, of San Francisco. The same company are also running a bedrock tunnel 6½x7 feet. They are in about 200 feet.

Washington.—The town is rather dull. Battis & Co. have struck good pay and coarse gold since they have changed the direction of the drift, and it is said they will take out $600 in a week.

Harroun & Co., and Root & Co. are at work at Rocky Bar, where a few years ago a very large amount of gold was taken out from the old river channel.

A Portuguese company is at work opposite town, and several Chinese companies are working the bed of the river below.

The Cascades.—In the Spring Slide claim, owned by Irish & Reagan, a tnnnel is heing driven and fine prospects are obtained. The Red Diamond is now in charge of John Goodman, and he is getting ready for hydraulic work, when the next season opens. The gravel prospects a dollar and a half per pan in some places. At Bnrrington Hill, Stranahan has been doing considerable work aud getting good pay. The prospect in this vicinity is exceedingly good.

Omega.—At Omega the mining season is about over, the supply of water being ahort. Dnring the short season most of the mines have done well and given employment to a number of men. Kidd & Co. are still working the old Prescott claims and are getting good pay.

Diamond Creek.—Curtley, in his claims has done first rate, and has them fitted up in good style for the next season. Van White & Co. also have a promising set of diggings.

The Salathiel is yielding good quartz. Upon the claim is an 8-stamp quartz mill, run by an engine called the Little General. The machinery is so compact that the whole arrangement might he placed in a good sized store box. The engine burns abont two cords of wood per day, and the mill crushes about 12 tons. The tnnnel is in 200 feet.

The North Bloomfield Co.—Bowman's ranch has been purchased by the company for the site of the new reservoir. Four hundred and fifty men are now employed, and every department of the labor, such as fluming, blasting, hewing timbers, etc., is under the management of competent men.

Kansas.—Same of 27th: This company has heen working for 13 months in search of the old lead of pay gravel on Selby Hill, and have strnck it. They will now commence a new incline to open the channel.

Rich Strike.—Mr. Coe says that a company in which he is interested made a rich strike in Steep Hollow, 18 miles from this place. The claims are drift diggings, and the main tunnel paid the expenso of running it. In the side drifts very rich pay was struck in the channel, the gold being coarse and so abundant as to remind one of '49 times. The gravel in these side drifts pays so well that the yield is as high as $50 per day to the hand. The claims are on the same range as the Burrington Hill claims.

Bridgeport.—Same of 28th: A contract has been entered into hetween an English company and Stidger, Evans & Co., whereby the latter agree to sell to the former all of their claims on Buckeye Hill for $200,000. The transfer will be made, and the money paid, it is thonght, in 90 days..... One day last week Henry Sweetland struck a splendid lead of gravel in his claims... At San Juan Hill several claims are heing put in order, and more mining will be done there during the coming winter than in a long time.

Eureka.—*Gazette*, 25th: We learn that this district is not lively. The Mutual Co. on the Jim ledge is setting a good example, and the prospects are that other companies will go down deeper. The Mutual has a shaft down 50 feet helow the tunnel and the tnnnel is 125 feet helow the surface.

Pittsburgh Mine.—Same of 26th: We are gratified to state that satisfactory arrangements, hetween the owners and the employés, have been made, and that work will go on as usnal.

Pleasant Valley.—The people are agaiu getting excited over qnartz, and beginning to prospect. T. C. Bourne sends us specimens from a ledge which he has lately discovered, that prospects finely.

The *Gazette* of the 27th says: A report was in circulation yesterday that the gravel mine at the head of Steep Hollow, owned hy White, Coe, and others, was yielding a hundred dollars a day to the hand.

PLACER COUNTY.

Good Prospect.—*Stars and Stripes*, Aug. 26th: Messrs. Hayford, Himes and Melville, whose claim is on Rich Bar, near Rice's bridge, on the north fork of the American river, ahout two miles from Colfax, strnck a good prospect on the 10th inst. From one pan of gravel $212.50 worth of gold was obtained. Last year the same claim was worked by other parties, and paid an average of $20 per day to the hand.

SIERRA COUNTY.

Hydraulicing.—*Messenger*, 28th: Alpaugh, Fritz & Ney, of the hydraulic claims between Pike City and Plum Valley, intend drifting hereafter. The claims have paid richly this season; hnt the tenacious clay rohs them of too much gold by the piping process. They have a rich deposit of unknown extent, the hottom gravel of which yields from 50 cents to $2 per pan.

Alaska Co.—The following, from an authentic source, exhibits the operations of the Alaska Quartz Mining Co. during the past 12 months. Number of stamps, 5; crushing capacity per day of 12 hours, 4½ tons; whole uumber of days run, 270; whole number of tons crushed, 1,200; cost of mining and milling per ton, $12; average yield per ton, $38; net profit per ton, $26.

South Sierra.—At Alleghany, several companies are at work. The Highland & Masonic hoys are pushing ahead their work to advantage. On the other side of town, the Alleghany Consolidated, the Blue claims and others are steadily at work. Jim Thomas aud others recently took ont of their claim here a nice little chispa weighiug 11 pounds.

Mr. Stevens, Secretary of the Oak Flat mine, informs us that they have temporarily suspended operations, but will resume work in a few days.

SISKIYOU COUNTY.

Slate Creek.—Yreka *Union*, Aug. 28th: We learn that new discoveries have been made lately hy the miners of Slate Creek and that capitalists from San Francisco are engaged in turning the Sacramento River near the mouth of this creek. Something near a hnndred miners are now working in this locality.

TRINITY COUNTY.

The Corral Diggings.—*Journal*, Aug. 28th: A gentleman from lower Trinity informs us that hut little has yet been done toward developing the newly-discovered mines on Corral creek, because of the scarcity of water. Those having claims are waiting anxiously for the fall rains. Our informant states that the day hefore he started an ounce was taken out of Clifford & Co's claim by two men with a rocker.

Low Water.—Trinity river is lower than ever hefore known. Miners out of employment should take this fact into serious consideration. Any unworked spot on the river is pretty snre to pay good wages, and it is in just such streams that large sums of money are taken out in a few days.

Arizona.

Rich Pay Dirt.—Prescott *Miner*, Aug. 20th: A. French, and others, fonnd, recently, on top of Bradshaw mountain, dirt that prospected all the way from three to fifty cents a pan, but as there was no water, they could not work it. Jackson & Co., are having a shaft sunk on the Box Elder lode, at Walker's, out of which they have taken some very rich .rock. Uncle Billy Pointer was also taking good rock ont of his lode.

Sterling.—Chas. Borger, the only gentleman here capable of running the mill and chlorination works, has quit. In all probability work will cease nntil the arrival of some one from San Francisco capable of filling Mr. B's place.

Prospectors.—Saturday there assembled in Miller's Valley, a short distance from Prescott, some 28 men who propose starting, soon, to prospect the region to the northwest of the San Francisco Mountain.

Gold Product.—In reports, Arizona is credited with producing, annually, $500,000, in gold, when, the truth is, she produces nearly double that amount. Why, the Vnlture mine, near Wickonburg, in this county, produces nearly $500,000 per annum.

Colorado.

Hoosier.—Boulder *Pioneer*, Aug. 17th: Samples of the ore, one of which is in our possession, look exactly like the richest specimens from the Terrible lode, Georgetown. One shot last Saturday threw out 400 pounds of this ore, and disclosed a continuous vein of it three inches wide, following down the south wall. In the center of the shaft large kidneys, from 50 to 100 pounds in weight, of this same ore are found.

California Gulch.—Denver *News*, 18th: Mr. Henderson is working eight men and taking out $5 per day to the man; Mr. Floyd, five men, $7 per day; Mr. Star, six men, half an ounce; Mr. Huey has just hegun working; Mr. Bard, working three men, has made no clean-ups; Caruth & Hilton, seven men, taking out $5 per day to the man; Graham Bros., five men, half an ounce per day; Leahy, Graham & Co., two men, taking out good pay; A. Y. Corman is making wages; Thompson & Gurley, four men, taking out $10 per day to the man; Wells & Moyer, four men, taking out wages; J. J. Hoover, six men, taking out $7 per day.

Cash Creek.—The Gaff Co., on acconnt of the scarcity of water, are now employing only seven men. They are taking out from $3 to $10 per day to the man. Mr. Snyder is working four men, and taking out about $12 per day. In Willow Gulch, Moses, Willett & Co. are working five men, and taking ont good pay.

Granite District.—Quartz.—The principal operations are being carried on by the Niagara and Yankee Blade Co's. The Niagara property consists of the Wateree, Monarch, Dowser, Tene Virta, Grand View and Empire lodes. On four of them shafts have been sunk 50 feet and upward. They also have feet on several other lodea not opened, and own two water powers on the Arkansas river. Their mill of nine stamps is on Low Pass creek. Several runs have been made from the Hattie Jane lode, prodncing from $400 to $800 per cord; 4¾ cords mixed surface ore from the Solux Tiyee lode producing $473; one-half cord from the Monarch lode, owned hy the Co., taken ont while prospecting the lode, yielded five ounces retort, worth $90; 3¼ cords aurface ores from various lodes, raised and crushed at an expense of $273, produced in the aggregate $432. The result of the last run of the mill, 9¼ days, was a production of $1,302.50, at a total expense of lesa than $1,000. The Yankee Blade shaft is 125 feet deep. A large amount of rich ore is out. A mill, containing 15 stamps, has been erected on the Arkansas.

Summit County—Gulch Mining.—There are five companies at work in French Gulch, three of which have not yet reached bed rock. C. P. Clark is working eight men, and Ladd, Todd & Co. five, and both are taking out good pay.

On Stilson's Patch, Mr. McFaddeu is putting in a large flume. Martin & Co. are working seven men, and McDonald & Co. two men. Both are taking out pay, the last clean-up of Martin & Co. being three pounds of gold.

In American Gulch, Hitchcock & Co. are working three men. In Humbug Gulch, Carter & Page are taking out $15 per day to the man. Mr. Iverson is working two men, and taking out pay. In Georgia Gulch, Mr. Clay is working three men; Mr. Boylan, three men, and taking out $12 per day to the man; and Hitchcock & Co. three men.

At Delaware Flats, Mann & Lane are working four men, and Stogsdill & Davenport, five men. Both companies are taking out good pay. In Gold Run, the following companies are at work: G. W. Mumford, seven men and three hydraulics; J. Nolan, five men and one hydraulic; L. Peahody, seventeen men and three hydraulics; M. Coatney, four men and one hydraulic; Moffat & Shock, ditto; and S. M. Walker, ditto. All are taking out large pay.

Iowa Gulch is worked by Stahl, Tuhhs & Co. in a systematic manner, and good pay taken out. McNulty Gulch pays largely. Christian & Turuer are taking large pay from Galena Gulch, as are Pollock & Co. from Soda Gulch. Pierce & Co. are working successfully in Corkscrew Gulch, as is also Mr. Hildebrand. On the Blue, Mr. Clack is making pay, and other varties are opening claims. Work is being done in Illinois Gulch, and also on Ten Mile.

Idaho.

Mining Items.—Silver City *Wave*, Aug. 24:—The Goldeu Chariot has on hand 200 tons of very rich ore, much of it showing free gold....Peck and Porter's shaft is being timbered....Corduroy has a large pile of ore on the dump. So has Billy Reynolds....Starlight have struck a three foot ledge forty feet down, containing a large proportion of decomposed quartz, said to prospect well. We were shown a specimen of solid quartz showing black sulphnrets in considerable quantity....Very rich rock now coming out of the Red Jacket. The Poorman is not yielding ore so ahundantly as in former years, though they are going after it with tunnels and crosscuts with a will.

Loon Creek Mines.—Correspondence of above: I made the trip from Oro Grande, the next town, 130 miles, in four days. Ahout fifteen miles of the creek has been located for har and creek, or rather river claims, as there are about 5,000 inches of water in the stream. These diggings aro on Loon creek, Lemhi county, about 120 miles from Leesburg. The largest prospect I know of is $1. I saw that; it was in two pieces. I have been told of $10 a day being made with a pan. Alexander Craig asnred me that he had obtained $17.96 to the pan. That I did not see. He also said he got $159 ont of a hole 4x4 feet, one piece weighing $8.

The New Diggings—Latest.—Boiso City *Statesman*, 24th: Joseph Boggs, who arrived in town last evening, furnishes ns with the following news: The diggings are distant from Placerville ahont 125 miles, via Deadwood. They cover a surface of twelve miles, consisting of creek and har claims, besides good gulch and hill prospects. He saw a lncky fellow take out $17 in one pan, and at another place a nugget worth $9 was found. The gold resembles the Blackfoot. Water is abundant; timber is rather scarce. Ahove five hnndred men are already there. Five hundred men from Montana were looked for daily. Mr. Boggs intends returning without delay.

Other Accounts.—Joe Pinkham writes from Idaho City: "Letters received last night from the new mines are very favorahle. Joe Gallatin Dr. Belknap and Dr. Betts, all report good mines and extensive. Thero are about fifteen miles of Loon Creek taken up, which prospects well, and another creek just struck, prospects not known. Joe Gallatin has ordered two more train loads of liqnors and merchandise."

The *Statesman* says: "The news is from nndoubted authority. We believe it fully. We have never before advised people to rnsh off to new excitements, but we now do most emphatically recommend our people to get ahead of the 'tother-siders from Montana and occupy the ground in advance.

Montana.

Through the Mines.—Virginia *Republican*, Aug 20th: G. F. Cope, reports at Cal

ifornia Gulch work progressing and miners satisfied. They were bringing in water from Granite Gulch. In Bevins' Gulch work was lively. The water from Ramshorn afforded every facility for mining, and results were large. In Rochester both mills were running, and the Julia Holmes, Watseka and Niff, among the best. The mills are doing well. Mr. Cope panned out several pans from the placers in Rochester gulch, obtaining not less than one dollar and twenty-five cents from five pans above bed-rock. Splendid rock is being taken from the Iron-rod, at a depth of 200 feet, in Upper Silver Star. The Green Campbell, at lower Silver Star, is the best lode developed in the Territory. The Horae Pans have arrived for the Everett mill. Davis' Bars, in Jefferson Cañon, promises well. Two bars, half a mile in length, have yielded to water thrown by a water-wheel, $10 per day to the hand. Two ditches are in progress.

CROW CREEK.—There were 300 men at work whenever they could get water. The placers are very rich. The Keaton lode has been sunk 100 feet. The vein is three feet in width and the rock yields $30 per ton by arastra,

Blacker is running two wooden stamps, on assorted rock, which produces $100 to the ton. He intends putting up a large mill next winter.

The Robert E. Lee lode is worked by Nave, who gets from average ore, with an arastra, $73 per ton.

INDIAN CREEK.—Men are constructing drain ditches and working placers which pay from $80 to $100 to the set of timbers in the drift. They are also sinking on five lodes, which prospect from two bits to two dollars to the pan. It is proven that six or seven miles of the gulch will pay from $15 to $20 to the man per day.

NORWEGIAN.—Messlar is averaging $8 to $10 per day to the man. Clarke & Fletcher are encouraged with their prospects.

STERLING.—Hall & Spaulding keep their mill in operation. Appleton's mill is running night and day, and Mr. Jackson, at Ward's mill, is making preparation for an early resumption of work.

WASHINGTON.—Harris & James are doing a successful business. Their placers are extensive and the average from ten to twelve dollars to the man per day.

SILVER STAR.—N. J. Davis is interested with Fred. Root in the Golden Clipper lode. The lode has been excavated to the depth of fifty feet, and presents a crevice of from two to four feet in width. The quartz averages $40 to the ton.—Wyant, Ross & Co., are running an arastra on this lode, and crushing two tons of ore every twenty-four hours. Alex. Everson is working rock in an arastra, taken from the John Heffner lode, which has been worked to the depth of twenty five feet, and has a crevice of four feet, averaging $30 to the ton. Sam Holman has an arastra crushing ore from the Georgia lode, in Georgia gulch. This lode is developed thirty feet in depth, and averages $25 per ton, with a crevice of six feet in width. Four ounces per day of gold are taken by Aiaslee & Tripp, with their arastra, from the tailiugs of the Iron-rod lode.

MILL CREEK.—J. M. Bailey is running his arastra upon ore taken from mines in Mill creek, which yields from $15 to $20 per ton. Kit Bradley has leased the Bradley lode, and intends starting his quartz mill.

SUMMIT.—Major Postlewait is repairing his mill, preparatory to commencing work upon the Keystone lode. Work is progressing.

NORWEGIAN GULCH.—The Sterling Co., 10 men working, have averaged, so far, $400 a week, and the yield continues undiminished. Messler & Co. have a flume over 1,000 feet long, with a branch over 200 feet, and are making handsome "clean-ups." Clark & Fletcher are encouraged to make preparations for extensive operations. The bar diggings on the cañon are being worked with flattering results.

FRENCH GULCH.—Deer Lodge *New Southwest*, Aug. 20th: The boys had a little excitement on Monday. Allen & Co's success on the west side was the cause, and a stampede was made, resulting in the recording of some 40 claims. The bar is about 30 feet deep, pay gravol all the way. R. B. Campbell is building a 700-inch ditch. Allen & Co. are taking out good pay, using 100 inches of water. The Spanish claims are paying well. Some 50 men are at work on them, but water can only be had about three hours per day.

MOOSE CREEK MINES.—H. S. Stackhouse, of Deer Lodge, in company with Charlie Bennett, returned from Moose Creek mines a few days since. The two principal gulches are the Pioneer and Independence. Each is two miles long. There are a number of side gulches. There is no water except the natural streams, giving Independence a sluice head three or four and Pioneer the same two hours per day. About a dozen claims are paying. Scott & Miller's yields four ozs. per day on two hours' water, two men shoveling, the ground having been stripped. The pay is near the rim-rock, not in the bed of the gulch. Andy Ferguson is working seven men on a ditch from Independence creek, which will be completed September 1st, and the water used in their own hydraulic, on ground now paying an ounce per day.

Nevada.

COPE DISTRICT.

LATEST.—Elko *Independent*, Aug. 28th: Good news comes in from Cope faster than we can record it. Yesterday Mr. Enright brought into our office samples of ore that required no expert to see the rich mineral all through it. Dr. Hudson also showed us the result of about three hours' work of himself and friend in the placers. There is about $5 worth of as pretty dust as we ever saw—the product of 23 pans of dirt. New discoveries are being made every day.

FOR COPE.—*Enterprise*, 24th: Quite a party of miners will leave here in a day or two for Cope district, where they intend wintering. It is milder in that region than here, and the parties expect to be able to work the surface mines as early as March. It is said that mines have been struck about 60 miles this side of Cope.

FROM COPE.—Silver City *Wave*, Aug. 27: Charley Hauson returned from Cope district day before yesterday, well pleased with the prospects of the place. He is having a house built here, all ready to be set up when it arrives at Mountain City.

Billy Hammond also came in yesterday, bringing some very fine specimens of ore from ledges in Cope district.

HUMBOLDT.

LITTLE GIANT.—We learn from the *National* that Robert McBeth has sold his interest in the Little Giant mine to Mr. Fox for $40,000.

The White Pine *News* of August 24th speaks of this mine as follows: "The mine in the last 14 months paid for the mill which works its ore, paid for roads leading to the mill and the railroad depot, and a net profit besides of $50,500. McBeth has been enabled to see his friends in the East, and has now sold out his one-half interest to his partner, Fox, for $40,000. Fox will make a hundred thousand out of it, and then sell for about another hundred thousand, while McBeth is now going resolutely to work to develop the Buena Vista Series, which he owns, and which he says he will show up, next New Year's Day, the best mine that ever was found."

REESE RIVER.

MINERAL HILL.—*Independent*, Aug. 28th: Charley Barrow dropped in on Thursday from Mineral Hill, and from him we learn some particulars. The ore near the summit of the hill is a fine bromide. There are a great number of ledges located, but Mr. Barrow thinks there are not more than three or four good ones so far discovered. The prospect is that this will be a lively camp in a short time.

REVEILLE DISTRICT.—*Inland Empire*, Aug. 27th: From our friend Dodds, just from Reveille, we have received some beautiful specimens of ore. An average assay from the Chico mine shows $282.71 per ton. According to the laws of Reveille, a man may have 30 days after the location of a claim to record it. The consequence is that no record is made of claims that do not reveal pay ore. Yet between 400 and 500 claims are recorded. About 100 men are in the district, and they tell us to wait and we shall see something.

COL. BUEL.—The *Enterprise* says: Col. E. E. Buel has returned to Austin from London, where he has succeeded in negotiating a large sale of mining property in the southern part of the State.

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

GOOD YIELD.—*Enterprise*, 25th: From a two weeks' run of 127 tons of ore from the Twin mine, Silver City, recently, at the Ione mill, the clean-up yielded $6,000, and about the same time 32 tons of ore from the same mine, worked in arastras near the Franklin mill, on the Carson river, yielded $3,640.

HALE & NORCROSS.—Same, 29th: This mine is yielding about 110 tons of ore per day. The shaft is nearly repaired. Good ore is found on the 175, the 300, and 400-foot levels.

YELLOW JACKET.—There is still 30 feet of mud and debris to get out, and as one tub cannot keep the water out, it is only occasionally that a tub of dirt is raised. This is the reason of the slow progress that has been made in cleaning out the shaft.

OVERMAN.—This mine is yielding about 50 tons of ore per day—ore worth $25 per ton.

IMPERIAL-EMPIRE.—The repairs of the shaft being concluded, drifting southward at 1,080-foot level is resumed. The upper levels continue their regular yield.

BULLION.—No ore as yet, even at the lowest levels, where the mine continues perfectly devoid of water.

GOULD AND CURRY.—The drift eastward from the seventh station is in a little over 30 feet. No quartz yet encountered. The regular yield of 40 tons of $45 ore per day is still kept up.

VIRGINIA CONSOLIDATED.—The new shaft is now down 245 feet, substantially timbered throughout. But little water is encountered, and the rock is not very hard. The dirt, rock and water are hoisted in tubs.

CHOLLAR-POTOSI.—This mine is yielding 200 tons of good milling ore per day, principally from the old Blue Wing stope.

WHITE PINE.

WEEKLY MINING REVIEW.—*News*, 28th: Mining affairs have improved somewhat. An increased number of men are at work, and a larger amount of ore has been shipped than for several weeks past. An important development has been made, which gives greater confidence in the depth and permanency of our mines. The Eclipse Consolidated shaft, on Chloride Flat, has opened up a body of high-grade ore, 12 feet in thickness, and lying nearly horizontal, at a depth of 112 feet from the surface. The litigation which has for a long time kept the Earl mine idle has at last been terminated by the Aurora Consolidated purchasing the Earl title. Aurora has already begun active operations by the shipment of large quantities of rich ore that had accumulated on the dump. The shipments of bullion since our last review amount to $73,571.70. Considerable shipments of lead bullion from our smelting works have been made recently, but we have no means of knowing the amount of silver contained, and no account is made of them in our reports.

MINING ITEMS.—*News*, 23d: It is said that the furnaces at Swansea are shipping about two tons of lead bullion per day, and that the quantity will soon be doubled. ....We hear of a rich strike in Keystone Ravine, several hundred feet below the Eberhardt mine, in a shaft 125 feet deep. Some of the ore is said to assay as high as $5,000 per ton....Work was started up yesterday on the Ora Dell by ex-Marshal Jackson, who is one of the present owners. The shaft is about 50 feet in depth. The body of pay ore is only 12 feet from the surface....The Eclipse Consolidated mine, on the north side of Chloride Flat, is now taking out high-grade ore, at a depth of 112 feet, from a deposit or horizontal stratum of ore 12 feet in thickness and resting upon a limestone foot-wall. This development is regarded as the most important that has yet been made in the district, proving as it does that our mines are not all on the surface, as many have supposed. It proves that when the upper horizontal stratum of ore is exhausted, there is almost a certainty of finding another one below by sinking, and strong probability that still further down will be found other strata....26th: Two men are at work at the Emersley mine, on the eastern slope of Treasure Hill, below the Hidden Treasure, assorting ore and getting the mine in shape to deliver to the new owners....The North Iceberg mine is taking out some very rich rock. A specimen, weighing 40 pounds, and worth several hundred dollars per ton, was presented to the Cincinnati party now here....28th: Work has been resumed in good earnest on the Parris mine, in the vicinity of the Poeotillo. Capt. Bilty, the principal owner, returned from below with ample funds. He is working double shifts on both the incline and the drift. The incline is down 37 feet, and presents a fine body of ore....*Empire*, 25th: Dave Buel is buying up Spring Valley ores to ship to Austin for reduction. ....A sale of the New York mine to Eastern capitalists is pending....26th: Uncle Joe Trench has gone to San Francisco for a 20-stamp mill, to be put up at once at his mine. He will also bring up the machinery for extensive smelting works.

EBERHARDT.—*News*, 26th: The Eberhardt mine is not, for some reason best known to the owners, contributing one-half that which it might, to the bullion shipment from here. A system of prospecting goes on, probably to open galleries for larger forces of men, and a large share of the labor now performed is what is technically known as "dead work;" but while opening up the mine *some* ore must come; and, to show the yield of this incidental product, we quote an item furnished by Mr. Mitchell, yesterday, from the Oasis mill. The yield for the past eight days has been about $30,000. Mr. Mitchell's figures are as follows:

August 17	$7,569.89
" 20	6,847.34
" 21	6,889.60
" 25	7,084.08

SPRING VALLEY DISTRICT.—*Empire*, John R. Berry just returned from this district yesterday, and placed on our table some very fine specimens of ore, showing well in sulphate and bromide of silver. He gives a very flattering account of the prospects, and reports about 50 men there. About 30 claims have been located. The average of six assays from an equal number of ledges, was $1,083.40. Seven tons of ore from the Reeves & Berry, worked at the Manhattan mill, Austin, yielded a little over $150 per ton. Small lots have been worked from other claims, the yield being as high as $300 per ton.

SMELTING WORKS.—*News*, 26th: The furnace of Jordan & Pritchard's smelting works at Swansea, was so much injured by the recent fire which destroyed the framework, as to require it to be rebuilt. This will delay the resumption of their smelting operations a few days.

SIX TONS OF BULLION.—Elko *Independent*, 25th: One hundred bars of bullion from the Swansea furnaces at White Pine, were unloaded at the depot yesterday, to be shipped to San Francisco by the railroad. This bullion is estimated to contain a large per cent. of silver.

New Mexico.

MORENO.—A St. Louis telegram August 26th is as follows: Gulch mining is reported as a failure in the gulches leading into Moreno Valley and depending on Red river. Water is entirely insufficient, causing great disappointment. Many miners are leaving for Colorado, Arizona, and other points. Willow Gulch, being self-independent for water, is an exception, and is yielding largely. Several new and rich discoveries were made recently in that vicinity, and a new 30-stamp mill is being erected.

Division of Labor is Progress.

"Some persons think the mechanics of the present day have, on account of the great subdivision of labor, deteriorated. This is erroneous. It is true that formerly there were but few mechanical branches, and that a boss in any one branch had to display a considerable knowledge of details not now used in the same manner. A gunsmith formerly had to learn the whole construction of the arm. He was required to make all parts himself and join them together in good style. The increased demand for such articles, and for all other mechanical productions, has necessitated a subdivision of such labor; as it would involve unnecessary loss of time and capital to employ the men in the same manner as formerly. Now there is one man, perhaps, solely employed to forge the springs; another attends to the screws; still another to the stock and woodwork, and so forth; and each one has to display as much skill, perhaps more, than would formerly have been required. Universality of knowledge in practical, as well as in theoretical matters, is, in fact, not of so much consequence as thoroughness in what we do. Human life is short and our capacities limited. It would be folly for one man to attempt to learn everything that science and experience has brought to light. It is far more reasonable and landable to aim at perfection as far as practicable in everything that we do."—*Workshop.*

THE GREAT WASTE OF GAS.—In both London and New York complaints regarding the quality of gas furnished to consumers has led to examination of the subject, and the appointment of referees for its settlement. The report of these referees shows, among other things, that the light given by gas depends in a great measure upon the shape of the burner. Those of the "fish-tail" sort are wasteful. Yet with cannel gas, they give better results than the argands. The kind of gas should therefore be considered; and the form of burner adapted thereto. One kind of bat's-wing burner gives an illuminating power of 99, —while the best fish-tail with the same gas gives only 89. The result is an enormous waste of gas,—because this description of burner is most commonly in use.

San Francisco:
Saturday Morning, Sept. 4, 1869.

Notices to Correspondents.

First Street.—The composition of steel still remains a debateable question with chemical metallurgists; the well known French *savan*, Frémy, contending that nitrogen must necessarily be present in order to convert iron into steel. The molecular condition of the carbon possibly is the most influential; for instance, if a piece of soft steel be divided into two portions and one of them hardened or high tempered, it will be found on treating the two pieces with dilute acetic acid that the piece of soft steel will ho scarcely affected, whilst hard steel hecomes rapidly dissolved. Further, soft steel, when dissolved, leaves a homogeneous gray carhuret of iron, whilst tempered steel leaves a black residuum, possessing no cohesion, and having the appearance of pure carbon.

High Pressure and High Temperature. Although water under sufficient pressure will retain its liquid state at temperatures above 212°, the experiments of Coignard de la Tour have shown that if the temperature be raised sufficiently high the liquid cohesion of water will ultimately disappear, and the water be found to pass immediately, without alteration of volume, into the gaseous form, possessing enormous tension. It is estimated by experimenters in this branch of physics that a complete change takes place from the liquid to the gaseous condition when water hecomes heated to redness.

B. Z., Napa.—Other liquids beside water, it is suspected, are occasionally to be found in mineral crystals. In one case related by the late Sir D. Brewster in Vol. 9 of the Edinburgh *Phil. Journal*, the case of an amethyst is described iu which a cavity existed which was three-fourths filled with liquid at the ordinary atmospheric temperature, but became completely filled when the temperaturo was raised to 83° F.; bnt, on cooliug, the vacuity re-appeared, with signs of ebulition.

Screen Making.—There are great numbers of metal screens used on this coast, nearly all of which are manufactured in San Francisco. J. W. Quick, at No. 203 Fremont street, has long made it his especial husiuess to prosecute this branch of manufacture, and is turning out a superior article, giving satisfaction to a large list of customers. His works are sold from Mexico to Alaska. Quartz and flouring mills are his hest customers.

The Diamond Region, iu Brazil, from whence the larger portion of the diamonds in the world have been derived, is a large valley, surrounded hy deep and lofty mountains, and called the Valley of Fire. It is forty-four miles loug hy twenty-two in width, and is the property of the government.

An Ancient Silver Mine—Singular Phenomena.

In the neighborhood of Goginau, in Wales, there is an ancient tumulus of silver mine waste, about sixty feet in diameter by thirty feet in height, which, from quite unmistakable evidences must be at least something over two thousand years old. At all events it was in existence, as is graphically expressed by the correspondent hereinafter alluded to, a long time before Julius Cæsar poked his Roman nose into the British Isles. Some thirty years ago a gentleman visited the spot, aud gave it and the mine from which it was extracted, quite a thorough examination. Extensive workings had evidently been carried on at the mine by the Romans, who must have had possession of it for a long time. There were also evidences of later workings, which, from their character could not have been of an earlier date than the time of Queen Elizabeth.

These explorations led to a reöpening of the mine, which has since become a very valuable property. The ancient miners, as many others have since done, had drifted to within a few feet of a very valuable deposit of ore before abandoning their work. The ore from this deposit has since yielded as high as 7,000 ounces of silver per month. In the more recent explorations of the mine an ancient Roman drift has been discovered, evidently an adit level, the onter opening of which has not been found. This level must have been at least 900 feet long, and yet it was only three feet high and eighteen inches wide! The wonder is how men could run such a distance in so narrow and shallow an opening. Its existence affords a striking example of the economy employed in the use of labor, iu those early days.

One of the most remarkahle discoveries connected with this ancient mine is described by a late correspondeut of the Londou *Mining Journal*, and the same person, ahove referred to, who visited the mine some thirty years ago. We extract as follows:

The most interestiug natural phenomena I noticed were that when we came to re-wash the old slimes, I cannot say whether of the Romau or the Elizabethan period, we found in the comminuted rock or dried slime all the particles had arranged themselves, so that without touching them it was impossihle to tell whether they were the hard lode-stone as it was taken from the vein, or whether it had undergone any change; but iu taking it in the hand it conld he moulded like a piece of putty, and what was still stranger, when these apparent stones were broken to show a transverse fracture there were fine veins of silver-lead ore, like threads of silk, in them, and, to the best of my knowledge, these were arranged exactly as in the parent vein from which they were taken—5° south of east.

It thus appears that since that heap of comminated ore had been placed there by the ancient Roman miners, a decomposition and re-arrangement had taken place among the constituents of the mass. Some portion, at least, of the ore,— argentiferons galena,—had been aggregated by electrical or some other influences, from its mixed condition, as thrown out, into regularly arranged veins of ore, exactly as they had existed in the parent vein. We have witnessed similar phenomena in the "ancient river drift" in the vicinity of You Bet, Nevada county. We have seen where small boulders and pebbles had been thrown out from shallow shafts, from depths where the mass had heen alternately exposed to the influence of air and water, uuder such conditions as to canse a softening of many of the (slate) boulders, that some of the houlders aud pebhles had been intersected hy narrow seams of sulphuret of irou—these seams having been carried, iu perfectly straight lines, through both the pebbles and accompauying cement—just as seams of quartz are fouud cutting the pebbles in the "pudding stone" in the vicinity of Boston, Mass. Such phenomena are interesting in their hearing upou the various theories of vein formation.

The Northern District Fair.

The Northern District Fair, which closed its exhibition on Saturday last, is pronounced by the Marysville *Appeal* as a success in its principal features. The show of blooded horses, breeders, etc., was the best ever seen in the State, and was the *ne plus ultra* of the exhibition. The display of horned stock, sheep, etc., was good so far as quality and blood were concerned; but it is said to have been meagre in extent. The mechanical exhibition was flattering; the show of fruit could not be excelled in the State. The same complaint is made of this that is generally brought against the State Fair, viz: that much of the money which ought to be paid out in premiums on agricultural articles aud productions is squandered in horse-race purses. It is to be regretted that this important feature in the agricultural fairs of this State cannot be held more in abeyance. The difficulty probably arises from the fact that a larger portion of visitors at fairs go to see the "sports," rather thau for information and benefit to others. We fully agree with the *Appeal* that it is evident that two policies must he adopted to make our fairs more attractive as well as useful. The managers must work with a greater capital, and offer larger and more general premiums; and if we have races at all, have the best. Citizens mnst take greater and more active interest in the management. As the matter now goes, the few do the work and the many do the growling. More of the former and less of the lattor will make our fairs popular and successful.

New York Society of Practical Engineering.

The above named organization held its first annual meeting for the transaction of business aud the election of officers on the 18th ult. James A. Whitney, one of the editors of the *American Artisan*, was elected President, and Lawrence Holmes, Corresponding Secretary. The Trustees of the Cooper Institute having offered the Society the free use of one of its large rooms, a resolutiou was offered and adopted inviting both graduates and students of the Cooper Union to participate in the meetings; also one providing that the graduates be privileged for admission to membership without the payment of an admission fee. A resolution was also carried by acclamation, extending an invitation to the Presideut of Columbia College and tho faculty and students of the School of Mines to he present and assist in the discussions, etc., of the stated meetings.

The next regular session of the Society will he held on the 16th inst., when the subject for tho eveniug will be, "The Uses and Construction of Water Meters." A carefully prepared paper will he read on that subject, after which a general discussion upon the subject will be invited, and an opportunity offered for the presentation and comparison of the most noted instruments of that description in use. Any inventor or manufacturer of water meters will be allowed, after the reading of the regular paper, to exhihit and explaiu his improvemeut, provided that he have either a working model or full-sized apparatus to illustrate his remarks.

The meetings of this Society are conducted much after the manner of the meetings of the Polytechnic Association connected with the Mechanics' Institute of this city.

Building in Boston.—It is thought that the enormous amount of twenty millions of dollars will he expended in Boston, for huilding purposes aud city improvevents, during the coming year.

Mechanics' Institute and Polytechnic.

The regular quarterly meeting of the Mechanics' Institute was held at the rooms on Post Street, on Thursday evening, at which the President, Mr. Hallidie, made a quarterly report, presenting a very favorable condition of the finances of the Institute, of the improvements which are in progress, and of the general prospects of the Association.

With regard to the approaching Exhibition, everything looks especially encouraging. Every available foot of space has been applied for; and new applications are constantly coming in, not only from the States and Territories of the Pacific Coast, but from the far East and South. The opening address will be delivered by Irvin M. Scott, Esq., of the firm of Booth & Co., and a member of the Institute.

The Polytechnic Association.

After the President had concluded his remarks, Professor LeConte, of the University of California, was introduced, and delivered a very able and interesting lenture on "The Mechanical Principles which Render Perpetual Motion Impossible." The Professor alluded to the fact that the discovery of perpetual motion has ever been a favorite idea with many ingenious though ill-instructed mechanics. Money enough is expended every few years in this vain pursuit to found and endow a college, which, by the teaching of natural laws, would establish, to the satisfaction of any educated mind, the absolute impossibility of any such result. He proved the impossibility of a perpetnal motion machine, hy reference to the doctrine of the "conservation of force," which establishes the fact that the amount of force in the universe is constant, and that no force is either annihilated or created; heing merely changed in form. That portion of it which in a machine is, owing to friction, converted into heat, is lost, as motive power; and consequently the machine must stop, unless the supply of power is kept up by external means. The same thing was proved also by algebraic reasoning; tho demonstration being aided hy the use of the hlack-board.

The lecture-room was well filled, quite a number of ladies being present. The thanks of the Institute were unanimously extended to the Professor for his very interesting and instructive lecture.

Important Sale Consummated.—It is said that the sale of the Visitacion Rancho, to a party of Eastern capitalists, has been fully consummated. The sum paid is one million dollars; numher of acres in the tract, 3,774. The land borders upon the Bay, and is situated to the south of the city, just over the line in San Mateo County, and some four or five miles from tho preseut center of business. It is stated that the company intend to expend an amount equal to the purchase money in improvements—of what nature we are not informed. The tract has an excellent water front, toward which the growth of the city is constantly tending, and might he made an excellent manufacturing locality.

Another Sale.—A large company from Ackron, Ohio, have purchased tho Feliz Ranch, near by the Visitacion Ranch, for $150,000. The company is organized iuto an emigration colony, and will soon remove to their purchase. A portion of the colony will engage in the mannfacture of pottery, for which excellent facilities are found on the ranch.

A Mammoth Gold Fish.—They have a gold fish in Oakland, which is said to measure fourteen inches from the tip of its nose to the end of its tail. This piscatorial curiosity would form quite a feature in the fountain at the Mechanics' Pavilion, during the coming Fair, if some one would secure possession of it for that purpose.

Immigration.

The reduced rate of travel recently extended to immigrants over the Pacific Railroad, bids fair to prove a success for the road and a great benefit to the State. The arrivals are about fifty per day, or at the rate of over 1,200 per month—mostly from the extreme western States. Very few of the immigrants so arriving would ever find their way hither *via* the Isthmus; so that we may consider those thus arriving as a net gain to the labor population of the State, above those who would reach here by water. This class of immigrants, moreover, coming from the great farming regions of the West, are such as would naturally seek the inviting fields presented in our great inland valleys. It is the very class of labor that is most needed to develop our agricultural wealth.

There is now a movement from various directions, east and west, looking to combined action or colonial immigration—co-operative associations of men and families with small means, to buy large tracts of ands, and either parcel them out to individuals or occupy them together, and embark in the dairy, wool-growing, cattle raising, fruit, wine or silk-growing business. Many such colonies will find their way to the State within the next three, four or five years. The genial climate, variety of resources, and great productiveness of soil in California, surpass similar advantages in any other part of the earth, and are fast becoming known in every portion of the world. The increased facilities and low rates of travel now enjoyed will greatly facilitate such movements.

The Pacific Mail Company will hereafter have but two rates of travel—$100 in the cabin, and $50 in the steerage. These prices will command large passenger lists from New York, and even from Europe *via* New York. We have also a rumor of an opposition line of steamers, which must still further stimulate immigration. The managers of the Central Pacific deserve credit for the wisdom and liberality which they have displayed, both in reducing their first class rates and in putting on emigrant cars at the very low price of $50. These cars, we are assured, are fitted up in a very comfortable manner—nearly as much so as the ordinary first class cars; the only difference being in the slow time necessarily made by their going with freight trains. Time, however, is not of special importance with those who will travel in these cars. By reason of all these various facilities, we may reasonably look for a continuous and very large increase of population during the two or three coming years. The predicted results of the railroad are being realized as fast as the necessary steps can be taken to accommodate ourselves to the change thereby introduced into our commercial and social relations with the rest of the world.

Death of A. J. Grayson.—We hear of the death on August 17th, at Mazatlan, of a California pioneer of 1845,—A. J. Grayson. He was at one time a prosperous merchant, but met with heavy losses, and finally devoted himself to the study of natural history, for which he had unusual talent. He excelled in the painting of birds, and, a second Audubon, occupied himself for several years in making a large ornithological collection. Frequenters of the art gallery at the Mercantile Library, will remember a picture of a stalwart hunter leaning on his rifle and gazing from the summit of the Sierra upon the Sacramento Valley. That is a portrait of Grayson.

The Mineral Hill Rush—Telegraphic. A dispatch dated Carlin, September 1st, says: Large numbers are leaving daily for the new El Dorado. One ton of rock, worked by mill process, yielded $900. It is reported that the Austin Company, the original locators, were offered $400,000 for their entire interest in the district.

The Isthmus Canal.—It is now said the negotiations have been concluded, and only await the forms of a legal completion, for the construction of a ship canal across the Isthmus of Nicaragua. The constructing parties are a company of French capitalists and the governments of Nicaragua and Costa Rica, which jointly control the lower portion of the San Juan river, through which the canal must reach the sea. It thus appears that the pig-headedness of the Columbians of Panama has lost to them forever the possession of one of the most important engineering enterprises ever conceived, and one which would have poured hundreds of millions of wealth into their territory. While they have been higgling with the United States Commissioners, and beating the bush for naught, their more enterprising and far-seeing neighbors have caught the bird. A canal from the Atlantic to the Pacific, at or near Panama, is a commercial necessity; and if the above reports are correct, the United States and Panama have lost the opportunity of constructing and controlling such a work.

New Patent Harrow.—T. A. & T. S. Brown, of Brooklyn, Cal., have just received a patent for an improved harrow. The device relates to an improved link connection, to be used where two harrows are united together, and it consists in employing in place of the usual hinge a link which is attached to one of the harrows; and a bar, having an enlarged head, is attached to the opposite one. This head is passed into the link, and serves to connect the two together, so that each of the harrows will have an independent motion back and forth on the ground equal to the length of the arm, and also an independent movement up and down equal to the length of the loop or link, thus greatly facilitating the harrowing of the ground by allowing each harrow to accommodate itself to the conformation or unevenness of the field, and insuring a thorough pulverization of the soil.

The Sierra Nugget.—The Downieville *Messenger* criticises an item upon large nuggets in the *Times*, and says of the one recently found in the Monumental Quartz Co'a claims—"It weighed 106 pounds avoirdupois, or 141 pounds 4 ounces troy, and stands fourth on the list of big chunks, to wit: 1st, the "Welcome Nugget, 168 pounds; 2d, the largest ever found in this State, 160 pounds; 3d, the Blanch Barkly nugget, 146 pounds; 4th, the Sierra County nugget, 141 pounds 4 ounces."

The same journal says: "As near as we can learn, about 100 pounds of gold have been taken out since the day on which the $50,000 was obtained, and the report is that there is a much larger nugget in the mine, and that the owners are taking measures to get it out without breaking."

We learn that the nugget will be on exhibition at Woodward's Gardens in this city on and after to-morrow, the 5th inst., daily, between the hours of 11 A. M. and 3 P. M.

Miss Anna Dickinson.—The lecture by this lady on the evening of the 2d inst. for the benefit of the Mercantile Library was a success. She lectures this evening at Platt's Hall, to-morrow evening at the Metropolitan Theater, and on Tuesday evening at Platt's Hall again. The subjects for these three farewell lectures are respectively "De Profundis", "A Lay Sermon", and "A Last Word".

Miss Dickinson has remarkably acute powers of observation, and has made good use of them during her visits to Yosemite and other places of note, and to various mines, manufactories, etc., in California. She will spend a day at the State Fair in Sacramento, and leave for the East some time during the coming week.

Familiar Science.

How to Treat and Use Rancid Butter.

Butter is a mixture of several kinds of fats. Fats are composed of glycerine, with acid, one of which is known as butyrine,—a fat consisting of glycerine and butyric acid, a very powerful caustic and pungent acid, having that peculiarly unpleasant odor which characterizes rancid butter. Butyric fat constitutes but a very small portion of the mass of any given quantity of butter; but within that portion is contained the principle from which its chief rancidity is derived. Butyrine, as such, is neutral or sweet; but when it is decomposed,—when its combined acid is separated from its glycerine,—the acid principle contaminates the whole mass of butter. This decomposition is more or less accelerated by the quality of the butter, or the greater or less care which is taken in its manufacture and preservation. All fats grow stale and more or less unpleasant to the taste and smell, with age, on free exposure to the atmosphere; but no one more readily than butyrine.

The decomposition of this compound is always the first step in the decay of butter, and when once set free, in any considerable quantity, it is impossible to remove it, except by evaporation; although a small portion may be removed by washing or "working" the butter in water or milk. To accomplish its entire removal, the butter must be heated to about 315° Fahrenheit, and kept at that temperature long enough for the evaporation of the acid,—five, ten or twenty minutes, according to the quantity operated on; but this process renders the butter unfit for table use, although it may still be employed for cooking purposes. If rancid butter is mixed in cake, a portion of the butyric acid will be absorbed by the water, and thereby partially neutralized, another portion will be evaporated; but the heat is not sufficient to make the evaporation perfect. If it is used for frying in an open pan, it will be pretty certain to lose all its butyric acid.

With this knowledge of the chemistry of one of its most essential components, the prudent housewife will be able to so purify rancid butter that she may make the fullest use of it without conveying any of its offensive properties to the articles of food into which it may enter in the process of cooking.

A Substitute for Food.—M. Rossi writes to the *Roman Scientifica* that by the use of a decoction of the *erythroxylon coca*, a plant which grows in Peru, men may retain their health and strength for several days without taking food. He himself had tried it, and felt neither hunger nor thirst for forty-eight hours after drinking freely of a tea made from the leaves of this remarkable plant.

Dew and Frost.—All bodies are constantly radiating heat, and if an equal amount is not returned from some source, they grow colder. Hence in a *clear* night the ground grows colder by radiating its heat freely into the atmosphere, where it is lost in space. When this proceeds to a certain extent, dew is formed, and if the air is sufficiently cold, the dew freezes into frost.

When the sky is cloudy the clouds either prevent the radiation, or reflect back a portion of the escaping heat. Hence a thermometer, in a close room, may mark the same temperature on a clear and a cloudy night; and yet a severe frost may accompany the former, while the latter is perfectly free from any such appearance. The clouds form a covering or blanket as it were, for the ground, and keep it warm precisely as a blanket keeps the reader warm when spread over him on a cold night. A very thin covering, by intercepting the radiated heat, will often prevent injury to tender plants. Even a sheet of the thinnest muslin, stretched over a tree in bloom, or plants, affords perfect protection from frost, when other trees or vegetables, uncovered, may be either seriously injured or entirely destroyed.

Green and Dry Wood for Fuel.

Few are aware of the great loss of heat sustained in the use of green wood for fuel. Green wood will lose, in being properly seasoned, about one-third its weight in water; or fully 150 gallons of water. Now all the water in every particle of wood must be evaporated before it will burn, and to evaporate that water, wood must be used which has already parted with its water. Hence in burning a cord of green wood we must subtract from its total heating power enough to evaporate 150 gallons—nearly four barrels—of water. That amount is absolutely thrown away, so far as any practical use can be made of the heat evolved by it. The evaporation of 150 gallons of water is equivalent to raising 750 gallons to the boiling point.

The heat, however, so employed, is more economically used than it could be in any of the contrivances for evaporating or boiling water, so that for this and other reasons, which might be named, the real loss of heat in burning green wood is liable to be overrated; yet careful estimates and actual experience show that seven cords of well-seasoned wood will go as far and throw out as much heat, for practical purposes, as eight cords of green. Of course, this estimate applies only to the extremes of green and dry; as the actual results will vary exceedingly with wood of different degrees of seasoning and different varieties of growth. The more porous the wood, the greater the necessity for thorough seasoning.

Seasoned wood will sometimes burn with such great rapidity that the heat which it gives out cannot be readily controlled, and much of it is necessarily wasted. Under such circumstances green wood or a mixture of green and dry may be advantageously employed. Where the draught can be properly regulated, however, as in an air-tight stove, seasoned wood should always be preferred for either convenience, comfort or economy. Moreover, when wood is drawn from a distance, it is well to consider that with every cord of green wood half a ton of water must also be hauled.

The Citron and Citron Melon.—The citron, as imported in small boxes, is the rind of a large, thick-skinned, lemon-like fruit, which is preserved in sugar and dried. The flavor which it has is not imparted to it, but is natural to the fruit. The citron melon, grown in our gardens and put up for preserves, is a very different fruit. The thick, fleshy portion between the rind and seeds, is put up and preserved in syrup, to which ginger or other flavoring material has been added. A beautiful green color is imparted to it by soaking it for a short time in weak alum water. This fruit is merely used as a sponge to soak up the syrup and form a convenient vehicle for carrying the same to the stomach. Unlike the imported citron it has no flavor of its own, which it is desirable to preserve.

How to Save a Drowning Person.—It is of frequent occurrence among those who attempt to save others from drowning, to fall victims to the engulfing waters themselves. This is owing to the fact that they do not pursue the proper course in their efforts to save those in a drowning condition. It is not generally known that when a person is thus situated, if he is taken by the arms from behind, between the elbows and the shoulders, he cannot touch the person attempting to rescue him, and whatever struggle he may make will only assist the person holding him in keeping his head above water for an hour. If seized anywhere else, the probability is that he will clutch the swimmer, and, as is often the case, both will be drowned.

THE "FELTED" PAPER.—M. Pavy has patented a new and peculiar paper of extraordinary pliancy and strength. It can be sewn together like cloth. The *Mechanics' Magazine* says of it: "The uses to which this paper can be put are innumerable. We may mention a few of the articles we have seen. First, petticoats, which no girl of the period could resist. These may be printed exactly like the skirts now so fashionable, or they may be white, and have openwork stamped on in patterns, which scarcely any amount of labor with scissors and needle could imitate. The marvel is that they can be sold retail for sixpence each—little more than the cost of washing a petticoat. We have next bed furniture, of imitation cretonnes and chintzes. These are printed with patterns of great beauty, and a set of curtains will only cost five shillings. We have also quilts, which, besides being non-conductors of heat have a very genteel appearance. White day-covers for beds are made with embossed patterns and equally cheap. White table-cloths, stamped with patterns in remarkably good taste will, we are sure, soon ornament many a dinner table, and serve to light the fires the day after the party.

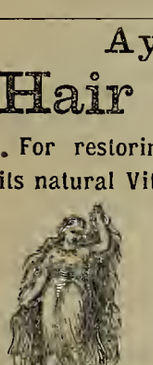
Ayer's
Hair Vigor,
For restoring Gray Hair to its natural Vitality and Color.



A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a

HAIR DRESSING,

nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long on the hair, giving it a rich glossy lustre and a grateful perfume.

Mining Property for Sale.
A Two Thirds Interest
OF THE
Golden Rule Mining Company's
Claims and Mill,

Situated in Tuolumne County, California, two and a half miles south of Jamestown, on the Great Mother Quartz Lode. A good 15-stamp Water Power Quartz Mill is situated on the property, with a never-failing supply of water, as can be shown by the last four years continual running. This Claim has three parallel Ledges, from 50 to 100 feet apart, averaging from two to six feet in width, with a length of six hundred feet. They are so situated that a tunnel has been run through them at right angles, making a surface drainage of from seventy to eighty feet in depth on the mine. The mine is well ventilated by shafts from the surface, and well timbered so far as worked. In the mine are steam Hoisting Works, capable of hoisting from a depth of 300 feet. A force of thirteen men only are required to keep both mill and mine running regularly.

On the surface and flats for a distance of 500 feet from these veins, the ground or surface was mined by placer miners, in former years, producing from two to five ounces per day to the man, during the season when water could be obtained, which fact goes to prove that a heavy deposit of ore was once contained in the croppings of these shutes, which, by all former and present theories of deep mine workings, came from below, indicating that when sunk upon to a proper depth, the lead will develop a mine equal to the Amador or Eureka.

This claim has paid its 19th regular dividend of $1,500 each, during the past four years, besides all the construction and other expense account, and has levied no assessments during the same time, and at present has on hand $8,000 in the Treasury, and no debts.

The last level, 150 feet from the surface rock, averaged $7 per ton, on which was a profit of from $4 to $4 50 per ton. The length of the two shutes of ore on the east vein, and the only one worked upon, has been about 200 feet.

Now I propose to sell two thirds of this valuable property for $16,000, cash; and any party who desires to purchase a property of this kind—which theory has proven that it requires depth, on well known shutes of ore, for a sure fortune—can obtain a chance here, providing he or they will go down a sufficient depth. No purchaser is solicited unless he first goes and examine the mine, or sends a mining engineer in whom he can have confidence, to indorse what he may think proper of what has been here stated.

For any further particulars, direct by letter to Wm Bosworth, San Francisco, P. O. Box 1978, or at my office, room No. 5, over Donohoe & Kelly's Bank.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.

New Almaden Vichy Water,

(CALIFORNIA VICHY WATER.)

FROM THE SPRINGS,

NEW ALMADEN,

Santa Clara County.

F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.

OFFICE, 506 JACKSON STREET,

GENERAL DEPOT:

Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the vellous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases wh re a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever;* Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever;* Gout, *when the patient is still able to walk;* Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece.

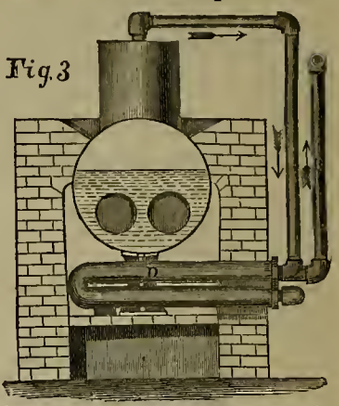
CARVALHO'S

Patent Steam Superheater



[SECTIONAL END VIEW OF BOILER, WITH SUPERHEATER.]

Saves Fuel! Saves Water! Saves Pressure!

Brief Extracts from letters from parties using Carvalho's Superheater. Full letters can be seen on application:

NAVY YARD, Washington, June 15, 1869.

"Superheater saves 12 per cent. in fuel and 10 per cent. more in speed of engine."

NAVY YARD, Washington, Oct. 8, 1867 (after *seven* years of service.)

"Superheater yet attached to boilers, and appears to be in good order."

HOWARD WATCH AND CLOCK CO., Boston, May 19, 1866.

"Superheater saves us at least 10 per cent. in fuel and gives a large increase of power."

JONES & SMITH, New York, March 21, 1867.

"Superheater saves 20 per cent. of coal, less steam pressure, exhaust more serviceable in drying paper."

STEAM ENGINE WORKS, South Brooklyn, April 23, 1867.

"Superheater saves not less than 20 per cent. fuel; no priming!"

CROCKETT LEATHER CLOTH CO., Newark, N. J., Oct 16, '67.

"Superheater economizes 25 per cent fuel; does our work with 25 lbs. less pressure steam, and steam superior for drying purposes."

N. Y. DYEING & PRINTING ESTAB., Oct 4, 1867.

"Superheater brings contents of our dye vats to boiling point in one-third less time and one-third less increase of water; saves us at least 15 per cent. fuel."

CONTINUOUS OIL REFINING CO., Binghampton, N. Y., Sept. 20, 1867.

"Superheaters give entire satisfaction, and we superheat to 55° deg—an increase of 200 deg."

CAREW MANUF. CO., So. Hadley Falls, Mass., Oct. 17, '67.

"Superheater saves 15 or 20 per cent. fuel; steam for paper mill now perfectly pure and dry—an important advantage in our business."

STATEN ISLAND FANCY DYEING ESTAB., June 18, 1867.

"Superheater saves at least 25 per cent in fuel, and we have the advantage (hardly to be over-estimated) of perfectly dry steam."

ÆTNA IRON WORKS, San Francisco, Sept. 15, 1867.

"Superheater saves 25 to 30 per cent. in fuel; no priming."

CONTRA COSTA LAUNDRY, Oakland, July, 1868

"Superheater causes a use of 50 lbs. steam instead of 60 lbs.; use much less water, and there is a saving in fuel."

HAVILAH M. CO., Cal., August, 1868

"Superheater causes a use of 40 lbs. steam instead of 60 lbs.; use much less water, and there is a saving of fuel." (2 sets.)

SIXTH MECHANICS' INST FAIR, S. F. Sept. 4, 1868.

"Superheater used proves that it saves fully 30 per cent. in fuel." (Chief Engineer.)

NEVADA MILL, Virginia City, May 30, 1869.

"Superheater is a perfect success, and saves three cords of wood in ten, or 33⅓ per cent. in fuel; engine works better."

And many other letters of the same tenor.

The Most Important Invention of the Day.

HALL & LEE'S

New Method of Packing Stationary Joints in Steam Engines,

— AND ALSO IN —

STEAM AND WATER PIPES.

BY THIS METHOD OF PACKING THE JOINTS ARE made perfectly steam tight inside as well as outside, thereby effectually preventing the steam from entering into the joints of the steam chest. Consequently, an Engine packed after this method will last twice as long as it will when other Packing is used; and the joints may be opened and closed every day, and they will be steam-tight every time they are closed, and the same Packing will remain good forever. Consequently, owners of mills will make a great saving, both in time and money, by having their engines packed by this method. Patented June 8th, 1869. By permission we refer to A. J. Binney, Supt. Northern California Railroad, and A. D. Starr & Co., Proprietors of the Buckeye Mill, Marysville. State, County and Mill Rights for sale by A. H. HALL & H. T. LEE, Marysville, Cal. 6v19-3m

A Long Desired Article

FOR CLEANING THE HEAD AND HAIR. THE CLEANing of the head and hair has been the subject of consideration for a long time. This object will be accomplished by using

CAMILLE CHAMPOO,

which not only does away with the poor soap so offensive to use, and so injurious to the hair, but it cleans the head, strengthens and beautifies the hair, preserves the color and prevents baldness. It is cooling in nature, and can be used with safety and reliance on the smallest infant. Price 50 cents per bottle. Prepared by EMERSON & LUELLING, **723** Mission street, San Francisco, Cal.

HEATHFIELD & BOGLE, Wholesale Druggists, **206** and **208** Battery street, San Francisco, sole Agents for the Pacific Coast. 24v18-3m

Great Loss.—A Philadelphia telegram of September 2d, says: Among the paintings burned in Earl's gallery, last night, was Bierdstadt's celebrated Yosemite Valley.

The Mining and Scientific Press, a most able California journal, has entered upon its nineteenth volume. The Press is now an influential publication, and is valuable to all classes—the miner, the farmer, and the scientific world generally.

It is a large, sixteen-page publication, and the proprietors, with commendable energy, have brought it to the front rank among scientific journals.—*Pajaronian.*

Returned.—Dr J. H. Paine, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

Photography.—For Cabinet Photographs, or Enamcled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction. 10v18 6m B. F. Howland.

Co-Operative Union Store.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 24v18-4w

Dr. Hall has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs Curling, Druit, Lee, Parker, Acton, Aitken, Churchill, Ricord, Velpeau, Boech, Sperino, and Hewilz Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco 21v18 3m

Use Pain Killer for Cholera and Bowel Complaints, for Boils, Cuts, Bruises and Scalds, Old Sores Sprains, Swelling of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Frosted Feet, Felons, **Sore Throat, Sudden Colds, Coughs, Etc.**

Use it for any of these, and you will never do without it. Its success as a valuable family medicine has induced others to initiate and counterfeit the Pain Killer to some extent. *Beware of Counterfeits!*

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

REDINGTON & CO., and HOSTETTER & SMITH, San Francisco, Cal., General Wholesale Agents

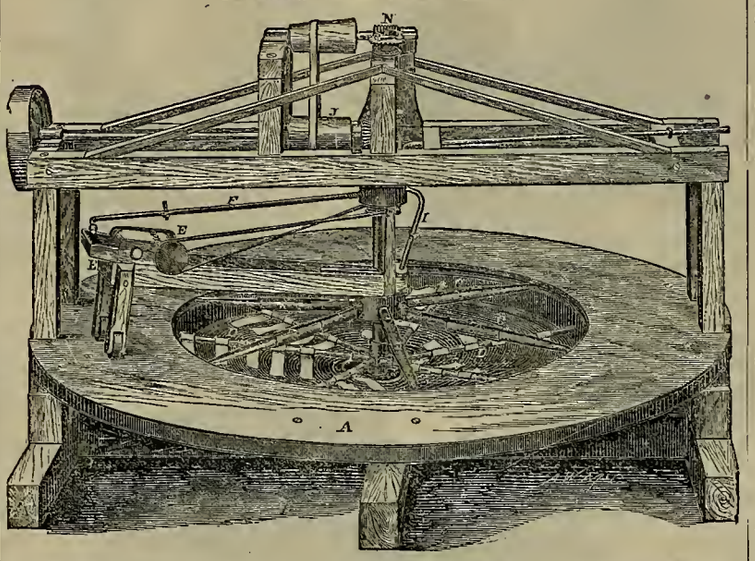
The Fourth Volume of the Mechanics' Fair Daily Press will be printed in the Pavilion, commencing September 14th. It will be distributed free to over **100,000** different persons! affording it a wide and immense circulation.

The Fair Press will contain eight pages, with many illustrations and interesting descriptions of articles on exhibition, amusing incidents of the Fair, and will form a very desirable first-class advertising medium. Advertisers will do well to secure their space early.

DEWEY & CO., Prop's,
Mining and Scientific Press, **414** Clay street.

PAINE & STEPHENS'
IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.



One Machine, costing about $1,300, is sufficient to work the Sands from 25 to 30 Stamps,

Less power being required than for any other Machine. The attention of quartz millmen throughout the State is directed to the subjoined certificates, and if they desire they can visit the Amador Mining Co's mill, near Sutter Creek, the Eureka Co's mill at Grass Valley, or the Banner Co's mill near Nevada, and see for themselves.

CERTIFCATES:

Grass Valley, Jan. 4th, 1869.—This is to certify, that we have used the Paine, Stephens & Harry Concentrators for over twelve months. They have given us entire satisfaction, and are the best we ever used. WILLIAM WATT, Supt. Eureka Mine.

This is to certify, that we have had in use for the past 18 months one of Paine, Stephens & Co's Sulphuret Saving Machines, constructed by John T. Harry, (called a buddle,) and which operates satisfactorily, particularly so in saving fine sulphurets, and we recommend it as well worthy of use, even where other Concentrators are used above it, as it will pay if there are any sulphurets. WM. L. TISDALE, Supt. Star Spangled Banner Mine.

Nevada City, Oct. 26, 1868.

Any one wishing to purchase one of these useful machines, can do so by applying to THOS. N. PAINE, at Grass Valley, Nevada County, or JOHN T. HARRY, Sutter Creek, Amador County.

SAN FRANCISCO
Pioneer Screen Works.

JOHN W. QUICK,

203 Fremont street, near Howard, San Francisco.

Screen Punching of all kinds and qualities for Quartz, Cement, Flour and Rice Mills, at greatly reduced rates.

ORDERS SOLICITED AND PROMPTLY ATTENDED TO.

I would call special attention to my slot cut and slot punched Screens which are attracting much attention and giving universal satisfaction, both as regards their efficiency and durability. This is the only establishment on the coast devoted entirely to the manufacture of Screens. It has furnished screens for the principal mills and firms on the coast for many years. 10v19tf

DR H. J. PAINE. ROBERT CULLEN.

PAINE & CO.,
Mine Commission Merchants,

No. 225 BUSH STREET,

SAN FRANCISCO.

Will negotiate the sale of Mines and receive consignments of Ores from Battle Mountain and all parts of the Pacific Coast. They will sell or work the Ores, as the consignors may direct. They guarantee to pay the highest prices for Gold, Silver, Copper, Galena, Lead, Zinc, Antimony and Tin Ores, on the shortest notice. They will make test or working Assays for prospectors at a very low figure. They will also receive orders and furnish Miners' and Farmers' Supplies, including machinery of all kinds, at the lowest prices. N. B.—All correspondence with us will receive prompt attention. 10v19-3m

A NEW
Gold Metal.

THE GOLD METAL WATCHES

Now being introduced by

C. E. COLLINS & CO.,

No. 629 Washington Street,

SAN FRANCISCO,

Surpass anything yet made in the way of an Imitation Gold Watch. They wear well, and keep good time.

The Ladies' Watches cost $10, $15 and $20 each.
The Gentlemen's cost $15 and $20 each.
Chains, from $3 to $6 each.

Can be sent by Express to be paid for on delivery.

C. E. COLLINS & CO.,

No. 629 Washington street, San Francisco.

P. S.—Where six watches of the above are ordered at one time, we will send one extra, free of all charges.

We also deal in the finest Gold and Silver Watches, Watch Materials, etc. Send for circulars or prices. 7v19 4t

Mines, Mills, Capital and Labor.

Almarin B. Paul, one of the most vigorous and thoughtful writers on current topics on the Pacific Coast, furnishes the following to the *Bulletin* of this city. It purports to be a reply to some querries by a White Pine correspondent. We reprint the answers entire.

Capita —What to Do and Where to Get It.

You say "If miners could hit upon some plan of building small and economical mills, they would get along better than to depend upon selling or going in with heavy capitalists, in too many instances to be swindled out of all by expenses and assessments." In that idea you have struck the key note, which if acted upon, will make every mining district prosperous, and give the whole State renowned life.

At this stage of affairs, when capital is so shy and exacting, it does call for some system whereby a few men of smaller means can club together, and, with a few dollars comparatively, put themselves in a position of independence, both against cheap labor and dear capital, by coöperating and working their own mines. I am laboring, and have been for two years, to this end, and so are others; and we all hope to succeed. I am watching with a critical eye every improvement in milling, as appendages to my system of amalgamation, and hope for a great reduction in first cost, simplification and cheapness of erection, not forgetting efficiency in working. Our present system has got too much iron about it; too much to the foundries; too much for freight; too much for erection; too much wear and tear; too much money to start with.

To the following points you and all inventive miners should turn your attention: A complete mill to work a few tons per day; that will cost but little, weigh but little, and get more metal out at less expense. We must get over our high-horse ideas of big mills, and no dividends—work less rock and work it better. My motto for the future (and I have had as you know, some experience in large mills) is, small mills and large mines, instead of big mills and small mines, and too often no mines at all. Small institutions worked by miners on the coöperative system, will build up a country and reward the industrious, when waiting for capital won't pay, and going into large joint stock institutions will pay less. Fair, square, prudent and legitimate *work*, is what pays in the long run.

As to capital, you need not look to San Francisco for it for some time to come. She has got her hands full already with her homesteads and other assessments. You can all go to work with a blind horse and an arastra and make more money than you can possibly coax out of San Francisco by coming here after it. As you say, San Francisco has got to change her tactics, or Chicago will change them for her. She has got, too, to look after the goose that lays the golden egg, and help out small institutions as well as big ones, or the East will capture goose, eggs and all. There is no question about it. There has got to be a different state of things. But to square up and balance her accounts for a new start she wants all the money she has now got and you can get for her (without her putting any in) to do it. Once righted up, she will keep pace with the East. For the present, you will do best to turn your faces eastward, for awhile at least, for capital—invite it by your bullion and moderate proposition to associate mills with mines—make no demands for cash—take half the chances.

This you must do or do nothing, comparatively. The East are shy of names also. They have been so outrageously swindled that they shake their heads at a proposition for coin or greenbacks. But you can make them listen when they see you are willing to stake your labors on the turn of a small amount of their capital. A few successful enterprises would bring you millions. So much for the first; and now the second:

Labor and What is in the Future.

This question is what interests the masses. They are the poor devils of creation, for you know the proverb says there are three kinds of poor—God's poor, the Devil's poor, and poor devils. God takes care of His poor (the rich), the Devil takes care of his poor (the bad), but poor devils (the honest) have got to take care of themselves, and they outnumber, though they do not outwit, all others. The masses it is who have got to scratch; and yet it is their scratching which sends the world along. Capital *vs.* Labor is the great question of the day. This problem is moving on to a solution at a ratio but little considered even by the actors themselves.

The Chinese Problem.

One of the agencies that are going to give it impetus is the incoming of the Chinese, and it is of this I want to speak. At this state of affairs, when our country is likely to be overrun with them, it calls for thought and action for security against them by the association of capital and *white* labor to use them. And here let me say, your miners must stare facts square in the face, and arouse all their energies, not by brutish or unconstitutional acts, but by putting yourselves in a way to use them. They are coming by the thousands; Yes, tens of thousands. There is no staying it. State laws cannot be made strong enough to do it, and national ones will not be enacted to prevent it; all organizations combined can't stay it; nature's laws are inevitable, for it seemingly is manifest destiny. I accept it as such. I have fought it; for I see an evil in it, which only the lifting of ourselves square up in our boots, and declaring that we will turn an impending evil into a universal good, by resolving ourselves masters and they our servants, can avert. Every miner, if he has brains, can use them to a profit, in some part of the vast mineral domain. If he has not this requisite, he must abide the wave that is to carry him on or under. He must use them, or counteract this cheap labor by coöperation; for without this action by all, the rich will be richer, and the poor poorer. The rich will use them to build up colossal fortunes and power, and for the poorer to fight them without avail, is ruinous to them.

If this great Asiatic wave can be stayed, then I say Amen; but can you do it? The world seemingly has turned upon its axis crosswise. The magnetic currents have changed. With the Caucassian it has been westward ho! With the Asiatic it is now eastward. The Orient and the Occident are to mingle.

New York alone wants 100,000. The South asks for 50,000 at once. From the fact that a Commissioner from Arkansas has already been dispatched to China for thousands, I would not be surprised to hear any day, that every hatteau in the harbor of San Francisco that can brave the billows of the ocean, will be chartered for China to fill the demand.

I talk plain—not that I want it, but that I see it in the future, and my interests in behalf of those who labor, calls for candid declarations and timely warning, that you all may understand it, wake up to it, husband your efforts, and prepare to meet it.

New Mining Advertisements.

Silver Wave Mining Company.—Location of Works: White Pine District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of August, 1869, an assessment of twenty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 418 California street.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of September, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the twentieth day of October, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.

Office, 418 California street, San Francisco, Cal. se4

Silver Sprout Mining Company.—Location of Works and Mines: Kearsarge District, Inyo county, Cal.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-seventh day of July, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Brown, H L	11	10	$5 00
Cleaveland, A H	7	10	5 00

Gillis, John	unissued	640	320 00
Hearst, George	unissued	200	100 00
Jackson, Otis	9	41	20 00
McLaughlin, J W	unissued	1000	500 00
McMillin, Thos	10	20	10 00
Mott, E B, Jr	unissued	200	100 00
Winard, A	unissued	1060	530 00
Williams, Mrs. Mary	16	80	40 00

And in accordance with law, and an order of the Board of Trustees, made on the twenty-seventh day of July, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the sales room of Maurice Dore & Co., auctioneers, No. 327 Montgomery street, San Francisco, California, on the twentieth day of September, 1869, at the hour of 11 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. B. WINGARD, Secretary.

Office, 408 California street, San Francisco. sep4

Mining Notices--Continued.

Allegheny Consolidated Gold Mining Company, Sierra County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixth day of August, 1869, an assessment of fifty (50c) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the seventh day of September, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the twenty-third day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, 37 New Merchants' Exchange, California street, San Francisco. au7

Cordillera Gold and Silver Mining Company.— Morelos District, Chihuahua, Mexico.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty third day of July, 1869, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No Certificate.	No. Shares.	Amount.
P M Jones	Not Issued	100	$100 00
S T Walch	76	10	10 00
W H Bennett	45	13	13 00
S T Walch	37	10	10 00
Alfred Harris	118	18	18 00

And in accordance with law, and an order of the Board of Trustees, made on the twenty-third day of July, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., auctioneers, No. 327 Montgomery street, San Francisco, on Thursday, the ninth day of September, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

HENRY A. REED, Secretary.

Office, 321 Washington street, San Francisco. jy24

Evening Star, No. 1, Silver Mining Company. Location of Works: White Pine District, White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fourth day of August, 1869, an assessment of ten (10) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 302 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-third day of September, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday, the fifteenth day of October, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.

Office, Room No. 6, No. 302 Montgomery street, San Francisco, Cal. au28

French Silver Mining Company.—Location of Works: White Pine District, (formerly Lander County), State of Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the nineteenth day of July, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
A G Chauche		2100	$105 00
L Franconi	7	1050	52 50

And in accordance with law, and an order of the Board of Trustees, made on the first day of July, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, on the thirtieth day of August, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

THOS. J. OWENS, Secretary.

Office, No. 10 Stevenson Building, San Francisco. jy10

POSTPONEMENT.—The above sale is hereby postponed until Thursday, the ninth day of September, 1869, at the same hour and place. By order of the Board of Trustees.

sep4 JOHN J. OWENS, Secretary.

Glenwood Mill and Mining Company, Green- wood, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of August, 1869, an assessment of thirty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at his office, 418 California street, (office Security Life Ins. Co.), San Francisco.

Any stock upon which said assessment shall remain unpaid on the eighth day of September, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-eighth day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.

Office, No. 418 California street, San Francisco. je12

Hamilton Hydraulic Tunnel and Mining Com- pany, White Pine District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the tenth day of August, 1869, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, San Francisco; or to M. T. Brewer, Hamilton, Nevada.

Any stock upon which said assessment shall remain unpaid on the tenth day of September, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-seventh day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, 37 New Merchants' Exchange, California street San Francisco. au14

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding months of delay requisite in transacting business through Eastern agencies.

Hornet Silver Mining Company.—Location of Works: White Pine County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fourth day of July, 1869, an assessment of ten (10c.) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 419 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the eighth (8th) day of September, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the thirtieth (30th) day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

M. S. MARTIN, Secretary.

Office, No. 11 Hayward's Building, 419 California street, San Francisco. jy31

I. X. L. Gold and Silver Mining Company.— Location of Mine: Silver Mountain District, Alpine County, California.

Notice.—The Annual Meeting of the I. X. L. Gold and Silver Mining Company, for the election of Trustees for the ensuing year, will be held at the office of the Company, Pioneer Hall, Montgomery street, San Francisco, Cal., on THURSDAY, September 9th, 1869, at 2 o'clock P. M.

J. CROWNINSHIELD, Secretary.

Office, Pioneer Hall, Montgomery street, up stairs, San Francisco. au28

Kincaid Flat Mining Company, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of August, 1869, an assessment of two dollars and fifty cents ($2.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 220 Clay street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eighth day of September, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the twenty-fifth day of September, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. H. CROWE, Secretary.

Office, 220 Clay street, San Francisco, Cal. au7

Marlborough Silver Mining Company.—Loca- tion of Works: White Pine District, (formerly Lander County), State of Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the nineteenth day of July, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.

K K Snow	31	200	5 00

And in accordance with law, and an order of the Board of Trustees, made on the first day of July, 1869, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, on the thirtieth day of August, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

THOS. J. OWENS, Secretary.

Office, No. 10 Stevenson Building, San Francisco, Cal. jy14

POSTPONEMENT.—The above sale is hereby postponed until Thursday, the ninth day of September, 1869, at the same hour and place. By order of the Board of Trustees.

sep4 JOHN J. OWENS, Secretary.

Wells Mining Company.—Location of Works: White Pine Mining District, White Pine County, State of Nevada.

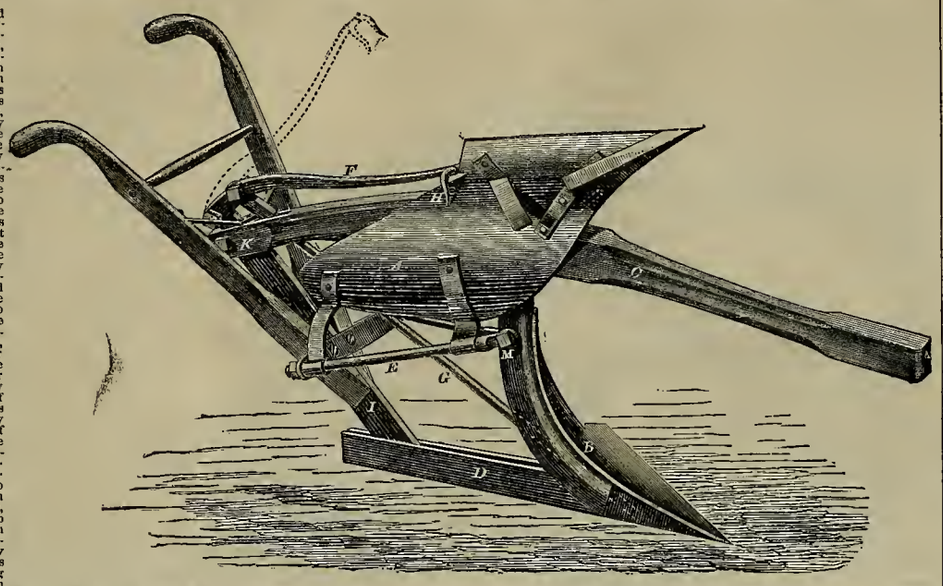
Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the tenth day of August, 1869, an assessment of thirty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 439 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Friday, the seventeenth day of September, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the seventh day of October, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. H. RUSSELL, Secretary.

Office, No. 439 California street, San Francisco. au14

SCOVILLE'S CLIMAX SIDE-HILL PLOW.



The advantages claimed for this new Patent California Plow over others employed for similar work, consist in its being so constructed that the plow which is not in use is thrown up in such a manner as to rest its weight upon the beam, as shown in the engraving, where the plow A, is firmly held by the hooks upon the end of the iron arm, F. The weight of the upturned plow is thus made to aid in keeping the opposite plow to its work in the ground, while the balance of weight is so equally divided as not to give an excess on one side. Its position is also such that it does not in any way interfere with the plowing, and the person who holds the plow can see to handle it as readily as though the mold-board was not resting upon the beam. The handles are so arranged as to give to the holder a sure and easy control of the plow. The rod, G, is operated by the arm or lever, F, so as to lock the plow to be used in its proper position in the standard, by entering a slot in the toe of the land-side, D. When it is desirable to use a single plow (as on level ground) either of the mold-boards may be quickly removed by loosening the nut, M, and removing the rod, E, thus converting it into a single plow. The mold boards are hung upon two angularly-placed axles, one of which belonging to the plow not in use is shown at E, with its mode of attachment to the axis. The plow may also be used double, as for ditching, etc., by slipping a cap over the joint of both plows when in proper position. The mold-board being made of the best of steel, and of a peculiar shape and great acuteness of sheer, will free itself or scour in all kinds of soil, and requires fully twenty per cent less draft than any other plow of same size. It turns the soil so as to bury the stubble, and leaves the ground in a good condition for seeding. This Plow has been successfully introduced, the following parties, among others, already having them in use: J. J. Reed, Marin county; A. F. Scott, Centerville; George W. Shade, Watsonville; James McCormick, Pescadero; and J. J. Wood, J. B Gilchrist and J. B. Jones, of Spanishtown, San Mateo county, California.

TWO SIZES kept constantly on hand 10-inch and 12-inch cut, weighing 90 and 105 pounds. Price for each, **$35**, and with two extra Shares, **$40**. Will make any size to order. If, after a fair trial, the buyer is not satisfied, he can have his money back. Purchasers can depend upon every Plow being of good quality and make throughout.

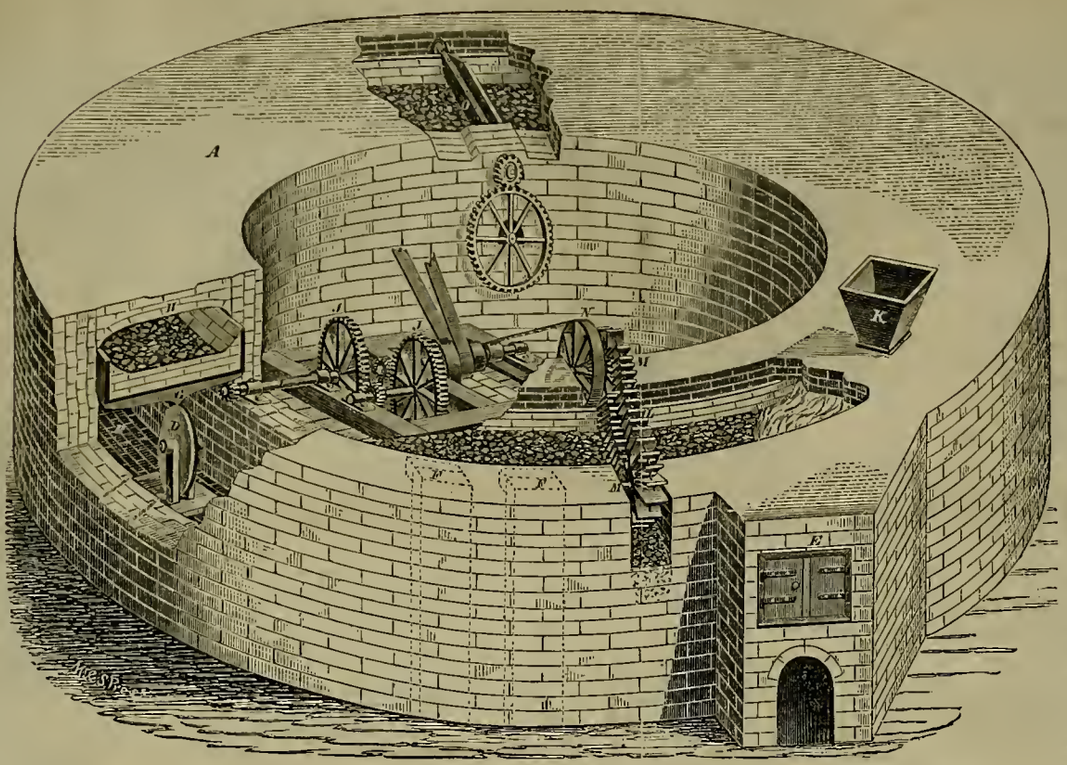
Fred. Ernst's Patent Rotary Roasting Furnace.



This is a mechanical furnace, which does away entirely with manual labor, excepting a fireman. It charges, roasts, stirs, and discharges the ore by a very simple mechanical contrivance,—in fact performs all the operation required in the oxidation or chlorination process of roasting gold or silver ores.

The ore is taken by means of an elevator from the battery, and is discharged constantly and regularly into the hopper, K, from whence it reaches the rotating hearth, G. This hearth consists of a cast iron orbicular ring paved or lined with bricks, and revolves on a series of iron rollers, D, and is kept continually in motion by means of the gearing, J. This gearing has two gear wheels, three feet in diameter, and pinions to regulate the speed from the cone pulley, increasing or diminishing it to conform to the required slow motion of the hearth, G. The hearth so charged and running constantly carries the ore into the first heat, which is next to the flues, and so passes all the different temperatures of the furnace, thus effecting a very uniform heating and chemical action on the ore; at the same time it has also to pass the stirrers, of which there are different kinds,—stationary and movable ones,—the number and speed of the latter varying according as the ore contains more or less sulphur. The movable paddle stirrers are shown at O. These movable stirrers are connected with the gearing under the iron bed of the hearth, G, as shown at different points, until it passes the fire-bridge, where it receives its ultimate and highest heat, and is then discharged by the discharging apparatus. This discharging apparatus consists of two chain or rag wheels, M, M. These two chain-wheels drive a double endless chain with inserted plates of iron (scrapers). The chain hanging loose underneath between the wheels draws these iron plates through the cavity of the hearth, and so discharges constantly the roasted ore. To keep the current of air constant throughout the whole length of the furnace, the arch over the hearth decreases slightly from the fire-bridge toward the flues. For concentrated sulphurets it may be advantageous to increase the circumference of the hearth. The advantages claimed as attainable from the use of this machine are—the doing away with a large portion of the costly hand labor ordinarily required, and the better and more thorough accomplishment of the same by machinery. A great saving of fuel, not only through the length of the hearth, but also for the reason that all the gases which are lost by other furnaces are economically employed in this as a substitute for other fuel.

The furnace is so constructed that the large access of air required for the oxidation of the ore, in addition to that demanded for the consumption of these gases, does not operate to materially lower the temperature in the furnace. When the ore in this furnace is once desulphurized, the gases cannot form any new combination with the ores or metals therein, for the reason that while the currents of air and gases are moving to the rear, the furnace hearth is constantly advancing in an opposite direction.

The construction of this furnace is of the simplest kind, and all the necessary castings can be easily transported even on mule-back. The loss of the silver by sublimation in present furnaces, it is claimed, is avoided in this, as the silver condenses before reaching the flues; the distance being great, and the heat diminishing gradually until the gases reach the point of final exit. Liberal terms are offered to parties who desire to use this furnace. Further information can be had by addressing the Inventor and Patentee,

F. ERNST, San Antonio, Lower California, Mexico.

Or by calling upon H. W. SCHMIDT, Druggist, Kearny street, corner of Sacramento, or at this office.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, **229** Fremont street,

1v1 San Francisco.

REBELLIOUS ORES.

THE HAGAN FURNACE.

The above method for the purification of Rebellious Ores is respectfully offered to the public. Repeated actual workings show that the

HAGAN FURNACE

Will accomplish all that the Reverberatory Process will do, and at an expense that is merely nominal. It has never failed to treat any ore effectually.

It has never been claimed for it that it will extract gold from ores which do not contain any of that metal.

Parties owning rich but refractory veins, can treat with the undersigned upon the basis of

GUARANTEED RESULTS,

With responsible security. For an interview, and all desired particulars, address

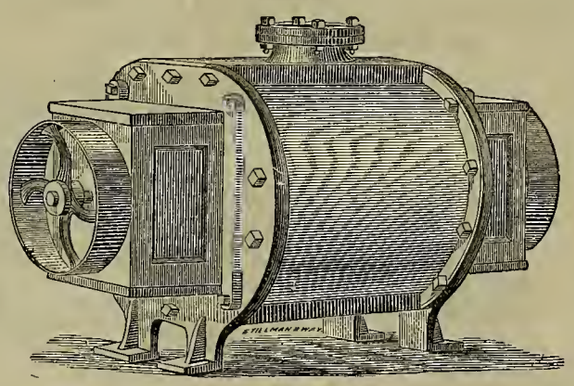
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

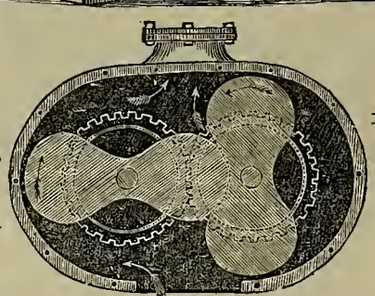
MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition,



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.



ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**

REQUIRES **Fifty Per Cent.** LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

KEEP & BARGION,

Job Printing.

We employ the best workmen in this department, and promise our customers—(many of whom have patronized the office for over eight years)—the best of work at very fair and uniform rates.

We are constantly adding new presses, type, and other material to our stock, making our facilities good for doing a wide range of work for merchants, mechanics, inventors, manufacturers, and tradesmen of all classes.

To ENGRAVING AND ELECTROTYPING, for illustrating books and circulars, we pay particular attention, guaranteeing our customers satisfaction in this line difficult to be secured elsewhere.

Printing in colors, bronze, plain and ornamental style promptly done. Especial care given to working engravings

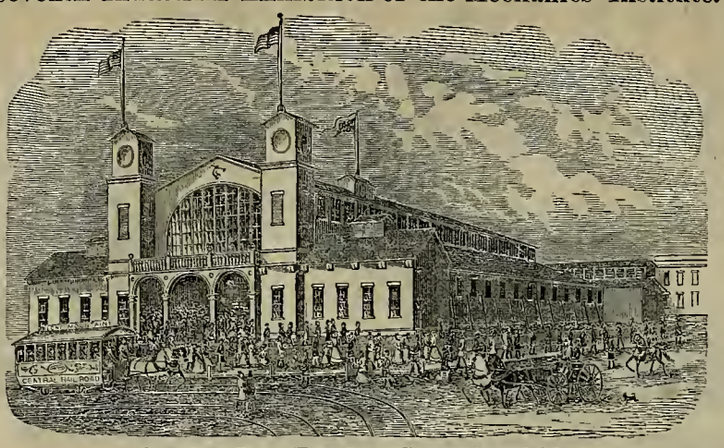
Seventh Industrial Exhibition of the Mechanics' Institute.



Opening Day, Tuesday, September 14th.

The Board of Managers of the Seventh Industrial Exhibition of the Mechanics' Institute announce to the public that the FAIR PAVILION ON UNION SQUARE will open on TUESDAY, SEPTEMBER 14, at 11 A. M., with the usual ceremonies.

The success of the last Fair was beyond the expectations of the Managers, and the satisfaction to the public was acknowledged by all. In the coming Fair, numerous additional attractions will be presented. Applications for space to exhibit have been received from foreign countries and the Eastern States, and the Managers confidently predict an Exhibition never equalled in California. Steam power will be furnished necessary to drive all machinery.

The Pavilion has been improved in many respects, and now covers an area of 90,000 feet. A new gallery has been erected, and additional decorations will be employed. The Pavilion at night will be illuminated by 1,300 gas jets, presenting a magnificent spectacle.

A celebrated band has been engaged for the entire period of the Fair.

The restaurant and refreshment departments will be in competent hands.

Admission:—Season ticket, admitting a gentleman and lady, $5; season ticket, admitting single person, $3; single ticket, 50 cents. Children, half price.

A. S. HALLIDIE, President.

Mechanics' Fair Daily Press---Fourth Volume.

Spicy and Interesting Sheet---The best Advertising Medium ever offered in San Francisco.

Eight pages, profusely illustrated, and furnished free to every Exhibitor and Visitor during the season of the Fair—from four to five weeks. Copies sent abroad to friends everywhere, containing description of the Fair.

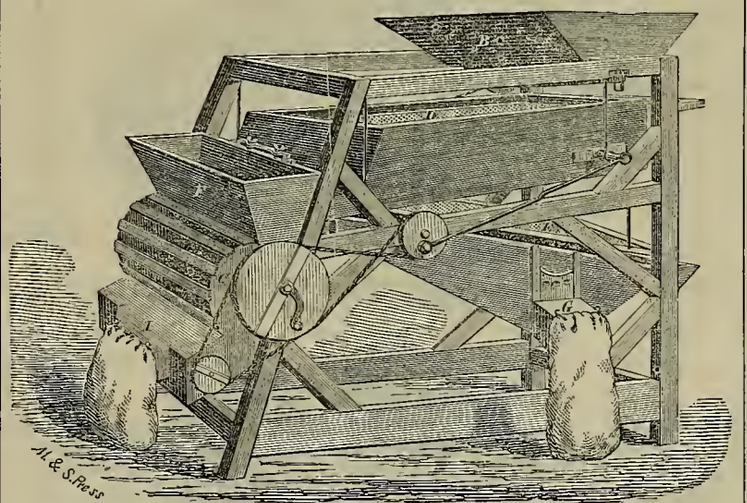
Secure your space and hand in your Advertisements early. Advertisements Engraved to order, or set in fancy type, to suit patrons, who will be rendered all assistance desired in getting up their notices. Orders received through agents or at the office.

Our three previous volumes have given patrons the best satisfaction of any advertising medium on the coast. *We have the exclusive privilege for newspaper advertising in the Fair.* DEWEY & CO., Publishers, 414 Clay street.

FOR FARMERS.

CROWLEY'S PATENT GRAIN SEPARATOR

AND BLUESTONE MIXER.



It Cleans Perfectly all kinds of Grain, and Separates Seed Wheat from Small kernals, Mustard, Barley, Oats, Cockle Pods, and other Impurities.

DESCRIPTION:

The grain is first emptied into a hopper, *B*, and is discharged through an adjustable feed gate, upon a series of shaking screens, *D*, which are so arranged that the crushed seeds and chaff will be caught by the first screen, the barley and oats by the next three, while the fair wheat which is fit for seed will be caught by the next screen, and discharged from it into the mixer, *C*. A finer screen, *E*, placed just below the one last mentioned, catches small wheat and saves it; but allows mustard and similar small seeds to fall upon the ground, or it may be saved and sacked at *G*. The tank *F* is filled with a solution of sulphate of copper, which is introduced gradually into the mixer, *C*, and the wheat is stirred and intimately mixed with this solution by revolving stirrers, after which it is discharged over a screen which frees it from surplus moisture, and passes it to the sacks, or trough which may be placed below the spout *I*.

The machine works equally well for cleaning wheat alone without using any mixture. When constructed for warehouse and mill use exclusively, the mixing apparatus is left out of its construction.

The inventor has for years bestowed much attention and labor on the construction of his machine, and has succeeded in making it durable and simple, and not likely to get out of repair. It can be easily adjusted and operated by any boy or man. It will soon save its cost in the labor of mixing "bluestone," which work it does more evenly and better than it can be accomplished otherwise. Come and see it and try it.

Single machines for sale. State and County Rights for sale on favorable terms to those who call early.

The machine can be examined at the shop of the proprietor, corner of Sixteenth and Valencia streets (near the Mission Dolores).

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.,

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,

Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

GALLAGHER, WEEO & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of D. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1857, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adins, Gaudier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, D. HARRIS.

On hand and for sale by the Agents,

California Academy of Sciences.

The California Academy of Sciences held its regular semi-monthly meeting at the rooms on Clay street, on Monday evening last, with a fair attendance of members. Mr. W. H. Haskell was proposed for membership. Dr. A. W. Saxe presented some specimens of the redwood log, heretofore mentioned in these columns as having been found 200 feet below the surface, by parties boring an artesian well in Santa Clara County. A diagram was also presented, showing the different strata of mud, sand, etc., passed through in boring the same well to the depth of 328 feet. A very interesting discussion followed with regard to these deposits, and the manner in which the fiber of the wood presented had been so perfectly preserved—wood found at such depths being usually carbonized.

Several specimens were received for the cabinet and museum, among which was the fossilized jaw-bone of a shark twenty-one feet long. Dr. Cooper gave notice that he had a paper which he should soon present for publication, on the animals of California.

Dr. Blake called attention to the singular phenomenon which was generally observed throughout the State, a few weeks ago, of a peculiar light in the heavens soon after sunset. The Doctor said he could explain it only by supposing it to have been caused through the agency of a vapor or smoky medium, which, at a high altitude, would reflect the sun's rays in such a manner as to present just such a phenomenon as was then noticed.

A request was expressed that each individual member of the Academy would gather all the information he could conveniently obtain, concerning the various weeds and plants that have been imported into California, and become naturalized here. The object of collecting this information is the preparation of an article on the subject, which shall, by the combined aid of the various members, be as complete as possible.

THE MEDICAL JOURNALS.—We acknowledge the receipt of the *Pacific Medical and Surgical Journal* and of the *California Medical Gazette*, for September. The first is published by Bancroft & Co., the other by Roman & Co. We wish both God-speed. The entire community is interested in the progress of medical science.

The Mechanics' Institute Exhibition.

The mechanics of San Francisco have already more than once borne off the palm for the most successful Industrial Exhibition ever presented to the people of the United States, and they are now determined to excel even any past efforts of their own. The people of this city and State never undertake trifles. In whatever enterprise they embark, no matter what its nature may be, they never measure their efforts by what has been done before; but improving on the past, strike out anew for that which has not hitherto been reached.

It was feared, a short time since, by the friends and well-wishers of the enterprise, that the late reaction and unsettled condition of business, might have a bad effect on the Fair—but to-day we can safely say that such fears were without foundation. The sons of toil, of skill, of enterprise and of art, are about to assemble once more in the Temple dedicated to their efforts, where they will add yet higher honor to themselves; and in the quiet walks of peace earn laurels, brighter, greener, and more lasting than ever crowned the brows of the proudest of earth's tilted lords. The foot-prints in the progress of civilization which will there be shown in wood, iron and marble, and in all the multifarious forms which toil, genius and art can devise for the pleasure and profit of man, will be more imperishable, and far more glorious than the proudest monuments raised in commemoration of the grandest wars, the memory of which history has or will preserve. The victories of industry and genius are constantly being reproduced—they never die out. Man is always more ennobled, always more god-like when creating, than when destroying.

We trust the mechanics and citizens, generally, throughout the State, will extend to this new effort all the encouragement in their power to make this SEVENTH EXHIBITION of the industry of California, that success which it so well deserves—to make it one of which the whole State and the entire coast may well be proud—one which will astonish the world by its extent and excellence. We should bear in mind that thousands are now seeking our shores from every quarter of the globe, filled with curiosity to see what California, what the Pacific Coast, can do and produce. Marvellous stories have been told of us abroad—of our rich and varied mines, of the wonderful productiveness of our fields and forests, of the genius, enterprise and industry of our people. All these things are being concentrated into representative form, in the great Temple of Industry, which has been reared in the heart of our city. Let the few remaining days and hours which are left, to still further perfect that work, be fully improved, to the end that we may not be subjected to criticism by reason of the slightest failure. The good name of our State, and of her people, were never more at stake than now. We never before had so many curious, peering eyes following our footsteps, to seek out our weak points, or become more thoroughly and practically acquainted with our possible advantages. The good repute of our State, its industrial and commercial advantages, the opportunities which are actually presented to immigration, were never before so directly dependent upon a public showing, never before held so intimate a relation to the success or otherwise, of a Mechanics' Fair. Therefore, let every one feel it a duty he owes to himself, and to the State, to do all that he reasonably can in behalf of this exhibition.

It is not even *now* too late for special efforts. Nothing will be left undone on the part of the managers, to afford every possible facility, even to the most backward of those who may manifest, at the latest hour, their desire to take an active part in the Exhibition. Let every one come forward and take hold of the work with that earnestness and vigor which has heretofore been so characteristic of California enterprise.

THE PENNSYLVANIA CALAMITY.—The papers of the week have been filled with accounts of the most frightful coal-mine horror ever known in our country. The Avondale mine, near Scranton, Pa., took fire on the 5th inst., from the furnace used for ventilating purposes. The flames were communicated to the hoisting works, which were destroyed, and escape rendered impossible. It was at first positively stated that nearly two hundred men were in the mine; but it has since been ascertained that the total number was one hundred and eight. As soon as it was possible, men were sent down to explore the workings; and on the 8th the bodies were found collected in one of the chambers, behind two barriers which the unfortunate men had built of coal and clothing, in the vain hope of excluding the suffocating smoke. At last accounts (telegram of the 9th) all the bodies had been recovered.

By this appalling catastrophe, six hundred women and children are left destitute. The New York Board of Assistant Aldermen has appointed a committee to receive subscriptions for the widows and orphans. The Gold Board and Stock Exchange appropriated $3,000 for the same object. The coal operators are also moving in the matter.

PERSONAL.—We understand that Mr. Horace Adams, who has been acting as superintendent of Goss & Lambard's foundry, Sacramento, for the last fourteen or fifteen years, has taken the place of Mr. Detrick, late superintendent of Booth & Co's (Union) Iron Works in this city. Mr. Adams is a thorough mechanic, and one who has ever commanded the respect of all with whom he has come in contact.

A USEFUL DEVICE has been invented by Mr. C. H. Horne, of Astoria (Oregon), whereby a rider is enabled, by pulling a strap passing through rings, to tighten the girth of his horse without dismounting or slacking his speed.

Write English.

Thousands of readers of the daily newspapers and of popular works on agriculture, mining, mechanics, etc., mentally ask, when they read scientific descriptions of fruits or flowers, of metallurgical or chemical operations, why the writers do not employ simple words in their descriptions, and more generally avoid the use of scientific terms, when plain English will often answer just as well or better. In writing for the scientific reader alone, there is, perhaps, less cause for such care, as to the educated mind such terms are often more precise, and better adapted for accurate comprehension; but when one is writing for the million, the plainest and simplest English should always be employed when practical, even to the risk of being sometimes slightly misapprehended.

As an example, take the following description of a plant: "Stem erect; leaves globose, pubescent on the under side; flower at first erect, afterward pendant, etc." Now take the same in English: "Stem upright, leaves egg-shaped, hairy underneath; flower at first upright, afterward drooping." If the last description does not convey the idea exactly, to common minds, then the English language is not lucid enough to convey *any* meaning.

PARIS EXPOSITION REPORTS. — We acknowledge the receipt, from Prof. W. P. Blake, of the report upon Steam Engineering, as illustrated by the Paris Exposition, prepared by Wm. S. Auchinloss, Honorary Commissioner. Also, the receipt, through Prof. Blake, of the report upon Machinery and Processes of the Industrial Arts, and Apparatus of the Exact Sciences—prepared by Prof. F. A. P. Barnard, of Columbia College, United States Commissioner. Like all the reports of the Commissioners, these are beautifully printed and illustrated. Both are valuable books, but we prize that prepared by Prof. Barnard, of 650 pages, as a very important acquisition. The double duty which devolved upon the Professor, of reporting upon "Instruments of Precision and Apparatus of Instruction in Science," in addition to the part originally assigned to him, as one of the Committee upon "New Inventions in the Useful Arts," is evidence of his especial fitness for the position; and it is fortunate that the work of placing before the reading world the finest display of instruments that the world has ever known, has fallen into such good hands.

DISTRIBUTION OF PLANTS.—The importance of a plant well bestowed is strikingly exemplified in the fact that all the coffee plants now cultivated in the West Indies have sprung from a single specimen given in 1720 to an officer of a French war-ship, by the Director of the Garden of Plants at Paris, with a request that he would pass it over to some one at Martinique, whither the ship was going, who would undertake its cultivation and propagation on that island.

Familiar Science.

Insect Bites and their Remedy.

When a mosquito, flea or other similar insect punctures the human skin, it always injects an atom of an acidulated poisonous fluid, which produces more or less irritation, according to the susceptibility of the system which is attacked. In the case of these insects, the attack is innocent of intended harm—food being the only object in view. A similar injection accompanies the sting of bees, wasps, etc., which is made not for food, but for defense or attack against a real or supposed enemy. The pain induced in most persons by the former, and always by the latter, excites the sufferer to seek a "remedy."

Bearing in mind the fact that the poison injected is of an acidulous nature, the obvious remedy is some *alkali* which will most promptly and effectually neutralize the *acid* of the poison. Ammonia or borax are usually the most convenient alkalies to be obtained, and quite as effective as anything which can be suggested. The former is usually employed; but chemists and physicians, of late, more generally recommend borax, the alkaline reaction of which is quite too little appreciated. This salt is useful in many ways, particularly as an aid in the washing of clothes, and should always be kept in the house. If those who are subject to insect annoyances would keep a solution of borax by them, and apply it as soon as possible after being bitten, they would find the application a great relief.

Bathing the face and hands with a strong solution of spirits of camphor, before retiring, will, with many persons, keep away mosquitos, as those troublesome insects, as well as most others, appear to have a decided aversion to camphor. Moreover, such a face bath, with most people, is a very agreeable one, apart from any indirect benefit.

In making a borax solution, the water should first be thoroughly boiled and then set away to cool, before the borax is added, after which replace it over the fire and boil again. The bites should be sopped freely and often with the solution, until the irritation passes away. For flea and mosquito bites, an ounce and a half of borax should be dissolved in a pint of water. For the sting of bees, three ounces should be used. The solution should be more or less strong according as the system is more or less susceptible to irritation from such causes.

The so-called "bites" of the common house-fly are quite different from the bites of the other insects named. Theirs is more of a tickling sensation, and is produced from suction without puncture or injection. Such bites are, sometimes, but only in rare and exceptional cases however, not only dangerous, but even fatal. A fatal case from such a bite occurred in Oakland, two or three weeks since, where a lady was bitten on the face. A very severe case occurred in Troy, N. Y., some six weeks since, where a man was bitten between the thumb and forefinger, from which he came near losing his arm. Other severe cases have been noticed in different localities the present season. The irritation or danger in such cases, does not arise from any poison *injected;* but from poison communicated by *touch*, from some carrion upon which the fly had previously been feeding. Such cases are similar to those which surgeons often meet with, who accidentally wound themselves with the knives employed in dissecting operations. The fly, by suction, opens the pores of the skin so as to allow direct communication between its little proboscis and the blood of the individual attacked; hence the effect. When there is reason to believe an occurrence of this kind has taken place, a physician should be called at once.

The Friction of Water in Tubes.

The friction or resistance which water encounters in its passage through tubes is much greater than generally supposed. The amount of resistance depends materially upon the smoothness of the walls of the pipe. This resistance is due to the particles of water, which, on coming in contact with the irregularities of the inner surface of the pipe, are thrown out of their true course, and thereby are not only delayed themselves, but impede the motion of other particles, in their onward flow. Experiments have proven that an inch tube 200 feet in length, placed on a level and connected as a discharge pipe from a tank, delivers only one-fourth as much water as escapes through a simple orifice in the tank, of the same diameter as the pipe.

Air passing along tubes, is also much retarded, as miners who are obliged to employ such tubes for the ventilation of their mines, are well aware. It is on record that a person connected with a mine in Europe, without properly considering this fact, once erected heavy bellows, for ventilating purposes, at a water-power two miles from his mine. When he set his apparatus in operation, he found it totally useless—his power was entirely taken up in the friction of the air through his two miles of pipe.

It is a singular fact that the friction of a liquid decreases in proportion as its temperature is increased. This is supposed to be due to a diminution of the cohesive properties of the particles of such liquid. It is well known that the more cohesive the liquid is, which is passed through a tube, the greater the friction and the slower the flow. This is apparent in the comparative flow of such liquids as water, oil and syrups.

The velocity of water issuing from an orifice is as the square root of its altitude. Thus, calling the velocity of issue under one foot pressure, 1, the issue under 4 feet pressure will be 2; 9 feet 3; 16 feet 4; and so on. A *short* tube is found to discharge water much faster than a simple orifice in a vessel, without a tube; the difference in favor of the tube is nearly one-half. This is due to certain peculiarities in the flow of liquids which can only be explained by the use of diagrams.

The simplest way of ascertaining the rate of discharge from an orifice, such as a pipe, duct or drain, is to measure the quantity discharged in a given time. Such mode of determination may be readily employed where limited discharges only are in question.

Rhubarb Leaves.—There has been some considerable discussion, of late, with regard to the action of the *leaves* of the common pie-plant, on the system, when eaten as greens. A family of five persons, in Indiana, was recently poisoned by partaking of such diet—one of whom died. Nine boys are said to have been poisoned in Chester County, Penn., by eating of the leaves—five of which died. Other cases have been noticed. The question seems to be whether the deleterious action results from some specific poison in the leaf, or from the fact that the pie-plant, like many other generally innocent articles of diet, are poisonous to certain constitutions. The leaves of this plant contain considerable oxalic acid, and it has been suggested that the deleterious effects proceed therefrom, being perceptible only on such constitutions as are particularly susceptible to the action of that acid. The facts are such as should induce great caution in the use of the leaves of that plant, although the stem may be used as freely as any other article of vegetable diet.

Lava Flow over Ice.—Lava has been known to flow over a layer of ashes, underneath which is a bed of ice. The non-conductivity of the ashes saved the ice.

A Phosphorescent Foot.—A Boston lady, recently, when about to retire, observed that a phosphorescent illumination appeared to proceed from the upper side of the fourth toe upon the right foot. Upon rubbing it the light was increased and spread over the upper portion of the foot, accompanied with a disagreeable odor. The phenomena, which was continued nearly an hour, was also witnessed by the lady's husband, who communicated the fact to the Boston *Transcript*, asking for an explanation thereof. Phosphorescence from a living body is certainly something new. A natural cause for the phenomena might suggest itself in the minds of some, if there was not reason to believe that the foot was subjected to frequent ablutions. Moreover, soap and water were freely applied as soon as the phenomena was observed, but without any apparent effect toward its abatement.

Poisonous Potatoes.—The sprouts of a potato contain an alkaloid, termed by chemists solanine, which is very poisonous, if taken into the system. This alkaloid does not exist in the potato itself, unless it has been exposed to the light and air, during its growth, by which it takes on a blackish-green color, upon the exposed side. Potatoes presenting such an appearance should never be cooked or fed to stock—they are poisonous to both man and beast.

Poisonous Candles.—There is a kind of stearine candle, which is remarkable for its alabaster whiteness; but it contains *arsenic*, and its use should be avoided. These candles may be known by the emission, when burning, of a more or less perceivable garlicky smell, and the giving off of a slightly perceptible white smoke. When broken they present a somewhat spongy fracture, rather than crystalline, as is the case with the genuine article.

Avoid Red Colors Next the Skin.—Many of the dyes now largely employed in woolen manufactures, are deleterious if not absolutely poisonous, when brought in contact with the skin by constant wear. Stockings, with red rings around the top, have been known to cause severe inflammations; even the time honored red flannel which was so innocent and comfortable in the days of our grandmothers, is now often colored with chemicals which are poisonous. The only safe color, now-a-days, for wearing next the skin, is white.

Horse-hair Snakes.—The American Entomologist thus disposes of the reputed horse-hair snake:—"The popular notion that these animals are animated horse-hairs is nothing but superstition. Like every other living creature, including ourselves, they spring from an egg in the first instance. They are not true insects, but belong to the Class of Worms; and just as man has intestinal worms that live and thrive in his body, so many insects are infested internally by these so-called horse-hair snakes. We have ourselves seen living specimens six inches long, that came out of the gigantic caterpillar, and have often seen smaller ones come out of grasshoppers."

To Whiten Beeswax.—Take the cleanest beeswax you can obtain, melt it in hot water, skim it out into a cup or basin previously oiled; when quite cold cut the wax into thin slices; expose these to the action of the sun and air upon white dishes, sprinkling it, unless there be rain, once or twice each day with clean water. At the end of a week melt the wax again, and proceed as before. In hot weather the wax may be floated on water in the middle of the day. This method is convenient for small practice; but white wax for commerce is prepared in large quantities by chemical process.

To Remove Writing Ink.—To remove writing ink from paper without scratching, apply with a camel's hair pencil a solution of two drachms of muriated tin in four drachms of water; after the writing has disappeared, pass the paper through water and dry.

Mining in Eastern Nevada.

[Written for the Mining and Scientific Press.]

Editors Press:—From the flush times of a growing excitement, to a period of deep depression; then slowly reacting, the normal level of healthy business has at length been reached. Varied by time and circumstances, such is the history of every mining community; and such has been ours in Eastern Nevada.

The immediate effect of the discoveries at White Pine, during the summer and fall of 1868, was to deplete of population, to a great extent, other and older districts with fewer surface attractions; especially in the counties of Nye and Lander. Had the excitement that followed the development of the Eberhardt, Hidden Treasure, and other mines in that district, proved to have been as baseless and ephemeral as mining excitements usually are, and as many gravely prognosticated, the result would have been disastrous in the extreme, to the hopes and reasonable expectations of those who have waited, with commendable patience, for the aid of a little well-directed capital in developing the numerous lodes of undoubted value and promise, in our older districts, that have lain comparatively unworked and unproductive for years, and under the ban of popular distrust and neglect. The substantial evidence of the permanence and value of the mines at White Pine, afforded by the large and constantly increasing yield of bullion, has fortunately served to redirect the attention of practical miners, especially, to the favorable opportunities presented for acquiring valuable mining properties at reasonable prices, in what the *Reveille* was wont to term, "outside districts;" and where the early prospectors and settlers, with a large stock of hope, and a small stock of money, but with a just appreciation of the value of their possessions, have for years eked out a precarious subsistence, by occasionally hauling a few tons of well-assorted ore to Austin, or some other distant point, and converting it into coin at a round cost of $85 to $100 per ton for freight and milling.

The lethargic condition of the mining interest in most of the districts of Eastern Nevada, during the past three years, however it may be viewed from abroad, was produced mainly by the untoward success of Eastern companies, whose capital, with few exceptions, was recklessly squandered by high-salaried and shamefully incompetent superintendents; who, instead of being practical miners, and having an experience acquired by a residence in a mining community, seem to have found their way into such positions through the nepotism of some prominent stockholder or director. Many companies that had secured titles to properties of undoubted value, were induced to withhold the necessary means of development by a fear of similar results, but without a knowledge of the causes that inevitably led to them. Among those of the latter class, I may mention, without making invidious distinctions, the Ural S. M. Co., of the Mammoth district, and the Florence S. M. Co., at Ione, each owning a series of lodes that with a reasonable amount of capital, judiciously expended, could, in a few months, be made dividend paying mines. Other companies under capable and economical management, and on the evo of assured success, like the Mt. Vernon, at this place, were, for the same cause, induced to suspend operations, and allow their property to go under the hammer, at a tithe of its value. At present, however, there seems to be a healthy revival of confidence in legitimate mining enterprises, especially in this immediate section; as is evidenced to some extent by the fact that in this district we have a home company (the Pioneer), with a capital, hard earned by its stockholders, engaged in erecting a 10-stamp mill, with facilities for working both gold and silver ores, and with satisfactory assurances that the business can be made a success.

We do not expect much material aid from California until her business men shall have done experimenting with an inexpansive currency, and with trying to buy and sell a harvest worth fifteen millions, with interest at three per cent. per month. In the meantime we must help ourselves as best we may, and turn our faces east.

Mechanical Progress.

THE THOMAS ENGINE-LATHE.—The N. Y. *Mining Journal* gives an illustrated description of this lathe, made in Worcester, Mass.: "Its sides are firmly tied together with cross-ties, unlike the common weight-lathe, and it has a large, powerful cone, with large gears, spindles, and centers to match, with hard gun-metal boxes, making it a powerful machine. The carriage is so constructed that it may be used with any improved weight alone, or it may be tightened with a hand-wheel and gib under the carriage, which makes the carriage slide firmly, thus adapting it to boring or squaring work at will. This carriage is very wide on the track, and will square out the full swing of the lathe without re-setting the tool, and it has no long, deep slot to get filled with chips, to be cleared out with an old file-shank, to the injury of the screw, but the top is plain, and protects the screw from dirt. The upper portion of the carriage removes, exposing the bolt-slots, for the purpose of bolting on work to be bored out. There is a shoo, or tool-post holder, which is reversible, that goes with the machine, for turning pulleys. The screw-cutting arrangement dispenses with an extra intermediate gear, by changing from right to left by means of a simple lever, and the screw attaches to the carriage by a clamp-nut, which is always ready at any distance from the head. The foot-block fastens with a star-wheel, which is a very quick and effectual operation, and dispenses with the old-fashioned bolts and nuts."

THE "FINISH" OF RUSSIA IRON.—One process is as follows: "The sheets are taken as they come from the rolls, and given a thin coating of petroleum. A number are then put together, enough to make a pack weighing three hundred pounds. The pack is placed in a muffle, closed up air-tight, and heated to from 800° to 1,000° Fah., where it remains about one hour. This, it is stated, converts the black oxide into a protocarbide of iron. Then the pack is placed under a heavy steam-hammer and worked until it is quite cool. The hammer-ram weighs seven tons, is self-acting, and strikes one hundred blows per minute. The striking surface of the dies is about one hundred and thirteen square inches, and the impact is equal to two hundred and forty tons. The anvil weighs thirty tons. Lighter machinery will produce the finish, but not so well or economically. In warm weather the pack must be hammered about twenty-five minutes continuously. One hammer will finish off from four thousand to five thousand pounds in ten hours."

MONSTER SCREW.—Another prodigy of iron work has just been turned out from the Corliss Steam Engine Works in Providence. It is a propeller screw for the United States steamer "Pomponoosuc," 18 feet in diameter and fitted on a wrought iron shaft 18 inches in diameter. The hub of the screw is 4 feet long and 11 inches thick. The screw is a solid casting of bronze metal—88 parts copper, 10 of tin and two of zinc, weighs 35,273 pounds, and is worth about $20,000. It is the largest casting ever made in Providence, and is a specimen of perfect workmanship.—*U. S. R. R. Register.*

UNLOADING BOATS BY MACHINERY.—The St. Louis Grain-Elevator Company have constructed a new machine, on the endless chain or platform principle, for unloading boats: "At intervals of four feet on the moving platform are fixed blocks, to hold barrels and hogheads in place, the width being four feet, sufficient for a hogshead of sugar. It is run by steam, and is capable of unloading 1,000 barrels of sugar, 700 barrels of salt, or 150 hogsheads of sugar per hour. Sacks of grain can be unloaded as fast as they can be put on and taken off. It extends a distance of fifty feet, and reaches from the guard of the boat from which goods are to be unloaded a considerable distance into the warehouse. It is also arranged so that it can be adjusted to high or low water."

HEAVY WATER PIPES.—The Warren Foundry, of Phillipsburg, are completing for the use of the Jersey City Water Company, 80 pipes to lay across the bed of the Hackensack River. These pipes will weigh from 6700 to 7000 pounds each, and are joined by a ball or universal socket five inches in thickness, the joints of which are turned perfectly true. This will enable the pipe to rise or fall in conformity with the bed of the river, without interfering with the flow of water which passes through them. The pipes are said to be the largest of the kind that have ever been made.—*Iron Age.*

THE PRINDLE RAIL.—This new rail differs entirely from any now in use. The *Rail Road Register* says of it: "Mr. Prindle uses two bars, side by side, confined in a plain chair which has one side higher than the other. In cross-section each bar has a half dovetail form. When one is turned upside down, they fit together, so as to make a nearly square split-rail, having, in fact, an oblong square cross section. Each bar being grooved lengthwise on its broad-side, it follows that the compound rail has a slot or groove running each side of its whole length. A jog on the inside face of the lower arm of the chair fits into one, the inner, groove of the rail. A groove in the inside face of the higher arm of the chair corresponds to the other or outer groove in the rail. Thus the groove in the chair and one groove in the rail make a square hole between the chair and the rail, into which slides a long square rod or key, which holds all firm. No matter how the rails are laid the grooves come all right on both sides. But Mr. Prindle lays the broader edge of the outside dovetail bar uppermost, and thus gets, as he thinks, a powerful *binder* for his inside bar.

The ease with which the rail is laid, and reversed when one face is worn, without disturbing its chairs is a great recommendation. But we do not see how, in a climate like ours, any split rail can escape destruction by frost and sand in the split."

ENGLISH AND AMERICAN LOCOMOTIVE BOILERS.—We quote the following from *Engineering*, of August 13th: "In America locomotive boilers, although under quite as skilled superintendence as our own, are yet more liable to explosion from the fact of their having generally less superfluous strength when new than would be considered necessary by our railway engineers. American locomotive superintendents use 5-16 in. and 3-8 in. plates, where we should use 7-16 in. or 1-2 in.; and notwithstanding the high pressures used, double riveting is still the exception rather than the rule. The consequence of all this is that in a list, now before us, of ninety-four boiler explosions which occurred in the United States during 1868, no less than twenty-three explosions of locomotive boilers are recorded, these explosions thus amounting to over 25 per cent. of the whole; while from another record of the explosion which took place in the month of May last, we find that during that month four locomotives exploded on different American lines. These are facts which demand the serious consideration of American locomotive engineers."

CLOTHING BLAST PIPES.—"Cleveland iron-masters are particular to clothe every bit of hot blast pipe very carefully with some good non-conductor. The cheapest and best plan for doing this is to take one part of salt, one of whitening, and two of puff of cinder (to make puff of cinder, fill a molder's hand ladle with liquid cinder, and then empty the cinder into cold water; it must be crushed afterwards). To the above four parts, add a good quantity of cow hair and mix up with water to a proper consistency for plastering. For first coat make it so liquid that it can be put on with the whitewash brush, and afterwards lay it on with a trowel as roughly as possible, not more than half an inch thick at a time. After three coats wrap it with iron wire and you can continue this to any thickness you like."—*Cor. Ironmonger.*

ENAMELS.—These are generally prepared by fusing silica, oxide of tin, and oxide of lead, and spreading the mixture over the surface of a sheet of copper, of gold, or of platinum. The objections to these enamels are their high cost, and the impossibility of giving them a perfectly flat surface. Mr. E. Duchemin has replaced them by the following compound: Arsenic, 30 parts by weight; saltpeter, 30; silica (fine sand), 90; litharge, 250. This is spread on plates of glass, care being taken that the kind of glass employed be not inferior in fusibility to the enamel.

Enameled glass prepared from the above may be written on, and the writing rendered indelible by simply heating the plate in a small open furnace or muffle.

THE LARGEST WIRE CABLE.—The largest wire rope cable in the country, being 5878 feet in length, has just been turned out at Roebling's mill, Trenton, New Jersey. The *Gazette* says it is to be raised on an inclined plane at Solomon's Gap, on the Lehigh and Susquehanna Railroad, to draw heavy coal trains over the mountains. In making wire rope, it used to require what is usually called a rope walk at least half a mile in length. But, by an invention of Mr. Roebling, the walk is dispensed with, and the rope is twisted in the middle.

Scientific Progress.

The Observations at Des Moines.

The special correspondent of the Chicago *Tribune* writes in addition to the notes made on the 7th: "The Litchfield party took valuable spectroscopic observations. Prof. Peters found the C line, indicating the presence of hydrogen, and the D line double, indicating sodium, in all the protuberances. He saw, also, in some, the blue line F for hydrogen, with green and other colored lines in the spectrum, the characters of which are not yet fixed. He thinks the results will be found to throw much light on the question of the sun's constitution. He took no spectrum of the corona. Rogers observed the protuberances with a micrometer. He found the extension of the lowest to vary from thirty-five to forty-one thousand miles from the disk of the moon, but this projected thirty-nine seconds beyond the solar disk, equal to eighteen thousand miles more, or a total of fifty-six thousand miles from the sun's surface. * * Professor Harkness corroborated the belief that the moon has no atmosphere, by the spectrum of a star taken at the instant of its being occulted by the moon. The spectrum disappears through its entire length at the same instant; whereas, if there were an atmosphere, it would cause the more refrangible rays of the spectrum to disappear later than those at the other end of the image.

Professor Harkness also obtained a spectrum from the corona, and found it continuous, with no absorption bands. This warrants the conclusion that the corona is due to the luminosity of solid substances, heated in an intense temperature. But the presence of one bright line in the spectrum indicates also the presence of a glowing gas. It is considered certain that the corona is self-luminous; but the fact that its light is strongly polarized, also points unerringly to the fact that a portion of its light is reflected. The more regular interior portion is probably the self-luminous photosphere, while the exterior, or irregular light is caused by the rays from the latter shooting up through the non-luminous atmosphere."

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.—This body met at Salem on Wednesday, the 25th August. We find an incomplete report in the *Rail Road Register* of the 28th: Among the topics thus far discussed are "Sexes in Plants," "Vertebrate Remains in Nebraska," "Geology of the Maine Coast," "Early Stages of Brachiapods," and "The Ammonoosuc Gold Fields." On Thursday, L. H. Morgan, Esq., of Rochester, read a paper on Indian migrations. On Friday, Prof. E. B. Elliott read an essay on "Longevity of American Ships, with the Approximate Law of their Loss or Decay." Professors C. H. Hitchcock, Marsh, Verrill, Edwards, Murray, Hoyt, Turning, Vose, Hartt, Kerr, Perry, and many others took part in the meetings, either reading papers themselves, or commenting on those read by others. On Saturday the City Government took the Association off to Nahant, Minot's ledge lighthouse and the forts in the bay. On Monday the reading of papers was continued, on the Eclipse, on the Geology of Brazil, the New Gold Region of Venezuela, the Rocky Mountains, Maine and New Brunswick, and on various ethnological subjects, the Age of the Shell Heaps of our Coast, the race-relationships of the Hairy Men of Japan, etc. Mr. Pierce presided in one department, Mr. Agassiz in another."

TRICHINÆ IN ALL RAW MEAT.—At the late meeting of the American Association for the Advancement of Science, held in Salem, Mass.,—says the New York *Sun*:—"Prof. J. Baker Edwards stated some facts concerning trichinæ. It is generally known that they are minute worms, which find their way into the system by the means of diseased pork, eaten raw or insufficiently cooked. The female trichina, once in the stomach, there propagates immense quantities of worms, which make their way into the muscles and feed upon them, thus usually causing death. Sometimes, however, the worm dies, and they then assume a spiral form, and can be examined with a microscope, if powerful polarized light is used. If meat containing trichinæ is heated to 212 degrees, the worms will be killed, and the meat will not injure the consumer, if it be good in other respects. Professor Agassiz followed Prof. Baker. He said that he "hoped" the appetite of the community would not be disturbed by this scientific discussion, as such worms are present in all meats and even vegetables, and there is no danger if they be properly cooked."

POLARIZATION OF LIGHT.—Prof. Tyndall, in a recent lecture upon Light, at the Royal Institution, reported for the *Engineer*, said,—in regard to the polarization of light by double refraction,—that if a beam of light which has passed through one plate of tourmaline impinge upon a second plate, it will pass through both, if the axes of the two plates be parallel; but if they are perpendicular to each other then the light transmitted by the one is quenched by the other, darkness marking the space where the two plates are superposed. If the two axes be oblique to each other, a portion of the light will pass through both plates. For, in a manner similar to the resolution of forces in ordinary mechanics, an oblique vibration may be resolved into two, one parallel to the axis of the tourmaline, the other perpendicular to the axis. The latter component is quenched, but the former is transmitted. Hence if the axes of two plates of tourmaline be perpendicular to each other, a third plate of tourmaline introduced obliquely between them, or a plate of any other crystal, which acts in a manner similar to the tourmaline, will transmit a portion of the light; emergent from the first crystal. The plane of vibration of this light being oblique to the axis of the second crystal, a portion of the light will also pass through the latter. By the introduction, therefore, of a third crystal, with its axis oblique, we abolish in part the darkness of the space where the two rectangular plates are superposed.

THE ANCIENT INHABITANTS OF UTAH.—Professor Scott, of Kentucky, has for some time past been conducting explorations in Utah. His labors have been rewarded by the discovery, near Evanston, of a mound of extraordinary dimensions. The work of excavation was speedily accomplished, and a vault was laid bare eight feet long, three feet wide, and four feet deep, in which were the skeleton of a man, a cone-shaped earthen pot, an iron bracelet and two medicine stones, cigar-shaped and full of holes. On the right side of the skeleton was found a plate of pure silver, the size and shape of an artist's pallet. There is positive evidence that this vault is more than one thousand five hundred years old. The Professor is confident that this discovery, to be followed by others under the direction of the Smithsonian Institute, will establish the fact that the mound builders crossed the Missouri River, and passing over the plains of the Great West, found their way into Central America *via* the Gulf of California. *Springfield Republican, Aug. 7.*

AN AUTOMATIC TRANSIT INSTRUMENT.—The *Scientific Review* describes a piece of astronomical apparatus recently contrived by Mr. Kincaid: It consists of a plane mirror and a burning glass adjusted in such a manner that the moment the sun arrives at the meridian the solar rays are condensed by the lens upon a piece of thread, which burns and so releases a detent; motion is thereby given to the hands of a clock, bringing it to the correct local mean time. There is a supplementary arrangement by which if the thread should not ignite, in consequence of a passing cloud at the instant of the passing of the first limb, the subsequent ignition of the thread will not affect the clock.

MUSICAL INTERVALS.—MM. Cornu and Mercadier, who have been investigating the subject, have arrived at the conclusion that a single scale will not satisfy all conditions. They say that the intervals in a scale of melody are not the same as in a scale of harmony.

DR. HAYS.—A Philadelphia telegram of date Aug. 28th, says: The brig Helen, from Irighal, Greenland, reports that the Panther, with Hayes' Arctic exploring expedition, sailed from Irighal on July 27th, for Disco Island, North Greenland, where the Panther is going to Melville Bay. Previous to the arrival at Irighal the Panther had been at Julian, Shaab and Kaasmurst, where the expeditionists had been in the interior taking photographs.

DR. LIVINGSTONE.—A London dispatch of Sept. 4th, is as follows: "The discussion of the probable fate of Dr. Livingstone has been renewed in England. Captain Burton, the African traveler, believes that the Doctor is a prisoner in the town of Luscenla, the capital of the Kingdom of Cossehee, and an expedition to search for him is talked of."

Farming and Gardening.

Picking, Packing, and Ripening Fruits.

Picking and packing autumn fruits requires both care and judgment. Fruit should never be taken from the tree until it is fully ripe, and yet it should be plucked before it has begun to "mellow." This is especially the case with pears, the gathering and packing of which requires especial care. This fruit ought always to reach the market before it arrives at its best condition for being eaten. If so managed, it will give much better satisfaction to both shipper and dealer, and will be attended with the least possible loss to all parties.

In packing apples, clean boxes should always be employed—new ones are always preferable; never pick until ripe, and never mix fallen fruit with that taken direct from the tree; for, although such fruit on this coast is never wormy, as in the Atlantic States; still, as a whole, it is in some way imperfect. If marketed at all, it had better go in boxes by itself, and should never be kept for winter. The boxes should be packed as close as possible, and the top put on with a little pressure, to avoid any possibility of shaking during transportation. The top layer should be carefully put in with the stems of each apple *upward*, and the bottom with their stems *down*, to take the pressure.

Ripening Fruits.

It has been a subject of frequent remark that so little research has been made into the changes which apples, pears, etc., undergo after they have arrived at such a degree of maturity as to separate of themselves from the stems, or be in the condition most favorable for being plucked. The changes which take place in growing fruit, have been more thoroughly investigated, and have led to most interesting and important results. M. Cahours, a distinguished French pomologist, has quite definitely proven that ripe apples absorb oxygen, and give out carbonic acid; and the higher the temperature of the place where they are kept, the greater will be the amount of carbonic acid evolved.

He has further shown that some kinds of fruit "where the process of bletting, [decaying in spots, from being over ripe] takes place, and without which such fruit is not edible, it is only after vitality has ceased, that the requisite chemical changes for economical purposes takes place. Air then enters the cells, and acts first of all upon the sugar, causing alcoholic fermentation, with disengagement of carbonic acid and formation of alcohol, which, in its turn acts upon the acids of the fruits, thus forming a true ether, which produces the aroma of the fruit. The air then attacks the cell itself, which becomes colored yellow by the azotized membranes of which it is formed."

The fruit examined and experimented on, as above, was of the variety known as "Service," a fruit allied to the apple, which is sometimes eaten; but, as observed, only after incipient decomposition has taken place. The "medlar," a tree of the genus *mespilus*, also fit to eat only when in a state of incipient decay, was another upon which careful examinations were made. These varieties of fruit present peculiar advantages for such examination; and it would prove a most valuable work for horticulturists, if some competent chemist would turn his attention to this matter, and make a careful series of observations and examinations into the changes which other fruits undergo after they have been taken from the tree. There is no subject connected with pomology on which there is so great need of definite and reliable information.

To Remove Salt from Pork.—Take the pork from the brine, soak in sour milk for a few hours; then put it in cold water for a short time, and the pork will be very nicely freshened.

A Remarkable Floral Transmutation.

A correspondent of the *Rural New Yorker*, says that a rose bush, of the Oriental sweet briar species, which for twenty years has annually produced the common, single yellow rose, in the garden of A. P. Randall, of Palmyra, N. Y. has this year come out with a flaming red presentation! This, as is generally known, is a single rose and a very early as well as prolific bloomer; and and it was noticed as somewhat remarkable that this spring it passed over its usual period of blooming without any appearance of buds. When the season arrived for the general appearance of roses, this bush also put forth buds, with its neighbors in the garden, and finally developed a semi-double, slightly fragrant red rose, much larger in diameter than the single yellow rose it had formerly produced. It is said to have a general appearance quite unlike any other—evidently a new variety, retaining the characteristics of the wild stock from which it had sprung.

The bush has never been grafted or otherwise similarly interfered with. This singular bush is growing in the immediate vicinity of the Michigan, Bourdault and Queen of Prairie climbing roses. The Chicago briar appears unusually vigorous the present season.

Another very remarkable feature is the presentation of two very different classes of leaves—the one small, like those of the original yellow rose—the other the full size of the ordinary rose leaf. The latter are growing luxuriantly, while the smaller or first crop of leaves seem to be failing and dropping off.

The correspondent of the *Rural* justly regards the phenomena as a most novel one, and says it is a perfect puzzler to the hundreds of observers of the anomaly thereabouts. Its next year's appearance will be awaited with much curiosity.

The circumstance, substantially as given above, is attested as a veritable fact. If such, it must be regarded as one of the most remarkable cases of the sports of nature on record. The mystery of the change of a simple yellow to a double red rose, is probably beyond the power of human philosophy to solve.

Wild Oats a Pest in Oregon.

We have already spoken of wild oats as a pest in California, and it now appears that our Oregon neighbors are suffering from the same trouble. Whenever this wild variety gets in with the cultivated grains, it is sure to be pronounced a pest sooner or later—worse than sorrel.

As a hay crop, wild oats are excellent, almost or quite equal to timothy; but as grain, they are worthless, and their eradication from the soil is very difficult. They seem to spread in a most mysterious manner, springing up here and there where least expected. Mr. T. L. Davidson, in the Willamette *Farmer*, says they have got into the wheat fields of Oregon, and are very badly mixed with the cultivated oats. In speaking of their peculiarities, he adds:

"The grains upon the stalk do not ripen regularly, some ripening and falling off while others are still green. Each grain has a long sharp beard, arranged so that when it is wet by the rain or water it will move when placed upon your hand. It is said that there are fields of it in California that just after a rain seem like a mass of living worms working in the soil. These grains work deep into the soil, and keep coming up from year to year, and the farmer wonders, after summer-fallowing his field, why it is that he sometimes raises more wild oats than the grain sown. In fact, I have seen some fields so literally taken with them that the crop had to be made into hay.

The best plan to get rid of this pest is to sow the fields infested with timothy seed, and, after the grass is mown off in the fall, turn sheep upon the stubble to keep the wild oats eaten off that will keep coming up for several years. Fields may be summer-fallowed for two years, keeping sheep upon them to eat off the wild oats. In this manner, I think Oregon might soon raise wheat that the mills would not dock from two to four pounds per bushel."

A Hardy Breed of Sheep.—There is a race of sheep, found pure only in the mountains of Navarre, which live and feed mostly in the mountains of that portion of Spain. These sheep never descend to the plains except when their mountain pastures are covered with snow. They dislike warm weather; but care nothing for rain or storms of any kind, so long as they can find pasture. This breed of sheep is said to be very hardy, and to produce good and heavy fleeces. An effort is being made to introduce them into the state of Missouri. From the description given of their habits, it would seem that they ought to thrive well in all our Northern States, and perhaps in that portion of our western territory bordering on British Columbia. A full description of this breed may be found in the last report of the Missouri State Agricultural Reports, page 294.

Cabbage Pest in Carson Valley.—The Carson *Appeal* says that some (in that quarter) unknown insect is destroying all the cabbages in the Carson Valley. They not only attack young plants, but even those that have arrived nearly to maturity. The leaves are completely covered with the insects. Tobacco juice, salt water and ashes, have been tried in vain to kill them. They appear to abound most where there is the greatest amount of alkali in the soil. Let our friends try a strong solution of bitter aloes, as recommended in another column, and inform us of the result.

Extraordinary Growth of Oats.—The Russian River *Flag* has received a bunch of oats, the product of a single seed, numbering 117 straws, averaging 50 grains each, or a total of 5,850 fold increase. This extraordinary growth is attributed to the fact that they grew upon the spot where a straw pile had been burned, the potash from which must have been the chief fertilizing agent.

The Tokay Grape.—Ross Williams, of Santa Clara, has upon his grounds two acres of the Bragg Tokay grape, the only vines of this species in California, except a few which he has given to his friends. The Tokay is one of the most famous grapes of the Rhine. There are three varieties of these—the Bragg, the Common, and the Flaming Tokay.

Hops in San Jose.—Mr. Coe has one hundred Chinamen now engaged in picking hops. The hops are dried in a kiln in from eight to twelve hours, and much more properly than they can be cured in the open air.

California Wheat in New York.—Mr. J. H. Warwick, reports that on the 15th of August last there were but 460,000 bushels of wheat in New York, 325,000 of which was of California growth.

Grain Exports.—Only two per cent. of the total grain yield of the United States for 1868, was exported. The total yield of wheat and corn was 980,000,000 bushels—about 28 bushels per capita.

Broom Corn is a valuable crop in Sacramento county. This article, when baled and delivered in Sacramento, is worth from $80 to $140 per ton, according to quality.

Steam Threshers.—There are 56 steam threshers now at work in the Salinas Valley. They have about 75,000 acres of grain to thresh.

Degeneration of Oats.—The *Country Gentleman* says that all heavy oats that have been introduced have degenerated, after a few years, to the old standard.

To Keep Insects From Smoked Meat. While smoking meat with chips or sawdust put on the fire a few red peppers. The fumes will prevent all insects from attacking the meat.

A Pest Prescription.

Great annoyance is met with in the flower garden from the presence, in multitudinous numbers, of the green fly, the mealy bug, the thrip and kindred insects which infest garden, house and green-house plants. The editor of the London *Floricultural Cabinet* offers the following remedy for these pests, which he says he knows from experience, to be effectual:

Dissolve half an ounce of bitter aloes in a gallon of water. With this wash syringe the plants so as to wet them under as well as over the leaves. If the enemy be there, he will be destroyed; if he be not there, he will not come. Whether it be the nauseous bitter on the surface, or the smell, or both, we know not; but, so far as it has been tried, infected plants may be put all around one so treated, and there will be no sign of thrips, bugs, or aphides, even if the others be covered. It is the only thing that destroyed the thrip for us; and we believe that, while the bitter remains on the surface, nothing living will touch it. We feel great confidence that even snails and slugs will not meddle with it; and all we can say about its effects on caterpillars is that they have not yet attacked a plant so prepared, and that they have committed depredations on plants very close.

Eat Fruit.

If farmers would grow more fruit in their gardens, they would pay less doctor's bills, and live longer. Grapes and strawberries are two of the most healthy fruits that can be grown. Let any person who has any disease of the bowels eat a quart of strawberries per day, while they can be grown, and his ailment will disappear, unless of too long standing to be relieved by any remedy. A pound of grapes eaten daily in the fall will be found the best and cheapest medicine that can be taken for complaints pertaining to the stomach and digestive organs.

Any farmer who neglects to grow these fruits makes one of the greatest errors of his life. Do not think that one single vine will suffice, or a strawberry patch ten or twelve feet square. You should have, at least, a score of grape vines. In regard to your strawberry bed, you should be able to pick the fruit by the peck and half bushel, and all that your family cannot use fresh from the vines should be canned for use in the next winter and early spring when there are no green fruits to be obtained.

A new strawberry plantation should be set as often as every two years, as but two crops from the same plant can be grown to the best advantage. It is true you can grow a crop sometimes for five or six years, on the same plants, but it is better to remove the beds oftener, leaving the old ones to produce a crop until the new ones come into full bearing.

Elephant Plows.—Among the usual agricultural implements now manufactured in Great Britain, are a large number of elephant plows, which are forwarded by way of the Mediterranean, the Isthmus of Suez and the Red Sea and Indian Ocean, to the place of their destination. Every morning at sunrise the elephant takes his mahout by the waist-belt, places him on his back, and starts into the field. Two assistants guide the two plow handles, and as long as the sun is above the horizon the elephant marches along, throwing up a huge ridge behind him, the furrow having a breadth of four and a half feet and a depth of three.

Saw Dust Bedding for Horses.—An old stable keeper in England says he has never had a bad foot on his horses since he commenced the practice of bedding on a thick layer of sawdust. Pine sawdust he finds the best, oak the worst. This is in accordance with what has already been recommended in the Mining and Scientific Press.

The Borer.—W. H. Herrick, Oswego, N. Y., writes to the *Country Gentleman:* "For ten years I have fought the borer, but have now fairly beaten him by the application of *solid whale oil soap*, rubbed around the base of the trees. It is a sure thing."

Cooked Meal is nearly double the bulk of uncooked, yet quart for quart it goes as far. The difference is that much of the food is indigestible unless cooked.

Make the Cows Comfortable.—It pays to make a cow comfortable in as many respects as possible. Every hour she suffers from any cause, the milk account suffers correspondingly.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, September 11, 1869.

Financial.

A slightly easier feeling pervades the money market, and anticipations for the near future are brightening. Money is more generally distributed, which prevents the present massing of it in large sums for business requirements; but deposits are also being made in greater volume and with more frequency. Rates, however, remain unchanged from our last quotations, viz.: 1@1½ in bank, and 1¾@1½ outside, on the best collaterals; lower grade borrowers pay higher in proportion. The value of our breadstuff exports from July 1st to date approximates $3,000,000, and the money market will soon realize the full benefit of these shipments. Our Branch Mint recommenced operations on the 16th of August, and has been actively at work ever since, turning out $666,000 in a little over one week. The coinage, so far, has been in double eagles, and has been turned over to the bullion fund, to replace its proportion of the million and a half drawn from that fund against refined bullion. The gold deposits for August amounted to 103,038 ounces, and the silver to 28,182 ounces. Gold bars ranged from 800 to 860. The coinage for August of this year falls short of that for the same month of 1868 by $799,000; but the gold deposits exceed those for August of last year by 16,531 ounces. The difference in coinage is due to the short time the mint was in operation last month.

Bullion is in short supply, with a tolerably active demand. Gold bars are quotable at 860@870; silver bars, from par to ½ per cent. discount; currency bills on Atlantic cities pay 32½@33 per cent. premium on gold; coin sight drafts are negotiable at 1¼ per cent. premium; telegraphic transfers are made at 2@2½ per cent. premium, at which rates operations are very limited; sterling exchange, 48½d; commercial exchange, 49½d; Mexican dollars, 66¾ per cent. premium, nominal. Gold in New York, September 9th, 135¼; legal tenders in this city, 74@74¾.

The Agricultural State Fair, now in progress at Sacramento, has, so far, exceeded in point of general excellence, interest and attendance, any of its predecessors, and promises to be a financial as well as an agriculturally ethical success. Our Mechanics' Institute Fair will open on Tuesday next, September 14th. Neither pains nor expense will be spared to render it worthy of the city and coast whose various interests will be represented. It will afford our many Eastern visitors a fair opportunity to form a correct idea of the variety and character of our domestic products. The pavilion will be suitably apportioned to exhibitors, so as to give each a fair share of space.

City Stocks.

Sales of Miscellaneous Stocks have been meagre during the past week. A small lot of Spring Valley Water stock sold at $61 per share. The usual monthly ½ per cent. dividend is payable since the 10th inst.——The People's Insurance Company announce their usual dividend for the present month.——The Merchant's Mutual Marine Insurance Company disbursed their usual dividend for the present month.——At the close, we note sales of San Francisco Gas stock at $85, and California Steam Navigation Co. at 53½@53 per cent.

Mining Share Market.

The sales in the Stock Board during the past week show a large diminution as compared with previous weeks, though the offerings embraced more than the usual variety of stocks. Prices, for the most part, are less firm. The fall in "American," through manipulations for months past, has been hurtful to a number of dealers to a considerable extent. It will not be out of place to republish remarks concerning this stock, made in the COMMERCIAL HERALD of the 18th of May last, as follows: "A 'ring' has been manipulating this stock for some time, making fictitious sales, circulating reports, and in various ways 'hulling' it, with the intention of getting rid of it at high prices; but most of the sales made were from one of the ring to another, and it is now believed that very little has been got off on outsiders at high prices. The strain has been kept up for a long time, but the scheme has in a great measure failed, the parties being unable to accomplish what they attempted. The mine evidently has no merit, and there is no reason why it should not drop to its old price of about $2 per share."

The sales in the San Francisco Stock and Exchange Board during the month of August for the past five years have been as follows:

August, 1865	$4,292,618
August, 1866	1,284,452
August, 1867	7,538,420
August, 1868	11,612,001
August, 1869	5,060,777

From a published report of the Yellow Jacket company for the fiscal year ending June 30, 1869, we learn the following:

RECEIPTS.

Balance per last report	$49,249 13
Bullion	1,761,313 69
Ore sold	18,693 62
Morgan Mill profits	109,982 88
Assessment No. 9, overpaid	200 00
Assessment No. 11, overpaid	530 00
Hoisting ore for Kentuck Co	5,027 49
Miscellaneous	19,452 89
Total	$1,964,449 70
Balance at company's debit	251,007 89
Total	$2,215,457 59

DISBURSEMENTS.

Labor	$277,288 45
Mine supplies	56,922 21
Improvement, No. 1 central works	3,838 43
Improvement, No. 2 south hoisting works	30,534 28
Legal expenses	10,717 60
Expenses, revenue stamps, etc	7,937 88
Candles and oils	11,683 33
Powder and fuse	3,754 20
Wood	64,080 87
Iron and steel	4,542 93
Timber	65,321 82
Crushing ores, outside mills	514,311 86
Crushing ores, company's mills	332,600 64
Assay, discount on bars and Federal tax	31,687 23
Real estate for mining purposes	6,345 00
Interest	12,809 18
Salary of officers	17,167 00
Assay office	2,771 89
Working tailings, company's mills	34,583 79
Dividends, Nos. 14, 15, 16 and 17	720,000 00
Tramway joint account	1,869 87
Profit and loss Mexican mill, etc	3,399 82
Yolo Tunnel expenses	182 48
Total	$2,215,457 59

The assets and liabilities of the company are shown by the following statement:

ASSETS.

Mine supplies on hand	$10,282 50
Assessments Nos. 1 to 11	412 50
Sundry open ledger accounts	678 57
Total	$11,373 57
Balance at company's debit	251,007 89
Total	$262,381 46

LIABILITIES.

Sundry accounts	$11,822 26
Balance due Bank of California	250,559 20
Total	$262,381 46

CHOLLAR-POTOSI.—Was in the market to a large extent. During the month of August the bullion returns amounted to $149,397, against $162,650 in July, and $175,700 in June. For the week ending September 3d, 1,220 tons of ore were extracted and 1,396¼ sent to the reduction mills. The yield for the week came from the following localities: Blue Wing, 845; New Tunnel, 200; and Grass Valley Stope, 176 tons. The north end of the New Tunnel deposit is affording a better quality of ore than has yet been mined in that locality, the vein being nearly seven feet wide, and gives encouragement of increase as they follow it down. Blue Wing yielded less this week, but the assays show an increased quality of ore. A dividend of $2 per share is payable since the sixth instant.

HALE & NORCROSS—exhibits some improvement. The ore yield for the week ending Sept. 4th amounted to 1,026½ tons, 295 coming from the upper and 73¼ tons from the lower mine. During the same time they delivered 636¾ tons to custom mills, leaving on hand 1,685 tons.——SAVAGE has been in moderate request. The bullion yield for August aggregates $32,645, against $51,000 in July, and $89,500 in June.

GOLD HILL QUARTZ—shows a bullion product of $7,564 for the month of August, against $7,137 in July.——SIERRA NEVADA reports the receipts of bullion for August at $12,697, against $16,661 in July, and $19,381 in June. A dividend of fifty cents per share is payable on and after the 10th.——The yield from the EMPIRE for August foots up $12,812, against $13,579 in July, and $15,277 in June.

GOULD AND CURRY—met with small sales at a slight recession. During the month of August the bullion returns amounted to $35,220, against $36,217 in July. The ore extracted during the week ending Sept. 6th amounted to 225 tons. Prospecting in the Last Chance stope (upper chambers) exhibits more encouraging features than the report made last week. Forty feet below the middle tunnel, and thirty feet north, there are fair indications of a large deposit of ore. At the seventh station the drift south has been run twelve feet and the one north sixteen feet. The material encountered is clay, mixed with porphyry. The ore reduced in August yielded $32 92 to the ton.——AMADON (Cal.) shows a bullion yield of $48,241 for August. A dividend of $6 per share was paid on the 7th inst.——EUREKA (Cal.) disbursed a dividend of $6 per share on the 8th.

The OPHIR drift has been extended a distance of 677 feet, the rock continuing as hard as mentioned heretofore.——CHLORIDE CONSOLIDATED (W. P.) reports a bullion yield of $59,000 for the month of August.

The White Pine *News* of Sept. 4th, has the following opening to its mining review for that week:

The improvement in mining affairs noticed last week still continues. The number of hands employed is increased every week, resulting in a proportionate increase of the quantity of ore sent to mill. But for the lack of milling facilities, the quantity shipped would be doubled, as several of our best mines—the California, Aurora South, Evening Star Consolidated, and Pogonip and Othello—are sending no ore to mill, and have large quantities accumulated on their dumps. These mines and several others are employing but a limited number of men at present, intending to increase their force largely as soon as they have suitable facilities for reducing their ores. The first three mines above mentioned belong to the Stanfords, and have two or three thousand tons on their dumps, awaiting the completion of the Stanford Mill, which will be running in about two weeks with thirty stamps. The Pogonip and Othello belonging to the Lows, and several other mines, are awaiting better and cheaper facilities for milling, yet our principal mills have engagements which will keep them busy until Winter sets in, and there is little prospect of any material reduction in the price of crushing at present. A considerable reduction was expected to follow the reduction in the rate of wages, but we do not see how this is to be realized until our milling facilities are materially increased. Should the Winter hold off late, the number of stamps in operation in the District will probably be increased to about 200, which will be kept busy all Winter, turning out bullion at a rate of at least $100,000 per week. Much, however, remains to be done to get ready for Winter, as few, if any, of our mines are prepared for working in stormy weather. The working shafts are yet to be housed in—a work of necessity that prudent men will commence within the next thirty days.

A development of considerable importance has been brought into notice during the past week, on the eastern slope of Treasure Hill. The Tom Paine mine, recently purchased by a Chicago company for $20,000, has been sufficiently opened to develop a well defined east and west ledge, over twelve feet in width, between two as perfect walls as any found in the District. The ore is of an unusually high grade, showing largely of born silver and pure chlorides, and nearly all the vein in the present works being composed of milling ore. The mine is fully 300 feet below the crest of the bluff, and about midway between the Eberhardt and Hidden Treasure mines, being, in fact, directly opposite and on a line with the Earl mine, which it resembles very much in character.

Our Office.

The office of the MINING AND SCIENTIFIC PRESS is located in the second story at No. 414 *Clay* street, north side, just below Sansomo. Here we have spacious accommodations, with our patent rooms, editorial room, counting room, and newspaper printing office,—all conveniently arranged and connected, and our facilities for dispatching business correctly and economically, better than ever before. Don't forget the number—414 Clay street, below Sansomo.

Weekly Shareholders' Directory, for Meetings, Assessments and Dividends.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Sept. 10, 1869.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

	Per ton.					Per ton
12 per cent. ore	$24 00	18 per cent. ore	$41 40
13 " "	26 65	19 " "	44 65
14 " "	20 40	20 " "	48 00
15 " "	32 25	25 " "	62 50
16 " "	35 20	30 " "	75 60
17 " "	38 25		

Ores assaying above 30 per cent., $2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

These prices, corrected by W. T. Atwood, we believe will be found substantially correct, and can be realized at this date.

THE COLORS OF THE OPAL.—The vivid flashes of crimson, green, and blue light emitted by the opal, proceed from planes inside the stone, at different distances from the surface, of different sizes and at all angles. Sometimes these planes overlap each other; so that two colors are alternately visible on slight variation of the angle.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

AMADOR COUNTY.

The Summit Mine.—*Ledger*, Sept. 4th: They are now sinking the south shaft, and the prospect is splendid. Eight hundred tons of rock have been milled, and paid an average of $25 to the ton.

Found it Again.—The Wolverine Co., at Sutter Creek, after sinking 200 ft. deeper, have struck their lode again, and now have a vein from 16 to 20 feet wide.

BUTTE COUNTY.

Mining Operations.—Oroville *Record*, Aug. 28th: The flume of White, Schwein and others, is approaching completion, and will soon be carrying the bluff to the river with the force and power of 500 inches of water on a fair grade. We notice that the Forsyth boys are running a tunnel from the river into the bluff. Mr. Hewitt is regularly cleaning up $3,000 to $4,000 per month.

CALAVERAS COUNTY.

Unprecedented Yield of Gold.—*Chronicle*, Sept. 4th: Twenty-one tons of rock from the claim of Lewis & Co., in Wet Gulch, near Independence, yielded $4,484—an average of $213.52 per ton. The quartz was crushed in Schmidt's mill at West Point. The lead is wide, well defined, and has every appearance of being permanent. Lewis & Co. are constantly taking out quartz as good as that, and have now 40 tons at the mill.

Railroad Flat.—Cor. of above: A circuit of five miles around Railroad will show the richest district in the State. The hill on the west side of Wet Gulch in my opinion deserves the name of Treasure Hill. A quartz mill is needed here. The opportunity for investment will not be long overlooked by capitalists. The claim of Gass & Co. produces rock that yields about $100 per ton, with all the indications of a permanent lead.

INYO COUNTY.

Cerro Gordo.—Letter to the *Territorial Enterprise* of Sept. 3d: In the Freiberg mine, a tunnel has been run 450 feet, which has cut three distinct veins of ore, the main one being 20 ft. wide. Large quantities of ore are being taken out which yields from $60 to $200 per ton in silver.

The Ignacio mine, which was lately sold to a San Franciscan for $20,000, is the richest one in the district, that is, the richest ore has been taken from this mine, some specimens of pure native silver having been found, though the ore generally contains some galena and much copper, sulphur and antimony. The highest assay obtained from rock in this mine is $984. What is termed the first-class ore yields from $500 to $800 per ton in silver. A shaft is down about 80 feet, and the vein is 28 feet wide.

The Frout, Belmont and San Lucas, all present indications of being good mines; all have yielded good ore, and in general features are much like the first two, though much less developed. As before stated, there are many more prospect holes and claims which are yet in an indefinite condition; all such we pass without mention. Lack of furnaces or smelting works is the greatest drawback in the district. Practically, there is but one furnace in Cerro Gordo, though several small affairs have occasional "fits" of putting on a business-like face. Belshaw's smelting works began operations less than a year since. These works have coined money for the owners, as they had full control and paid their own price for ores. When in full blast, this furnace turns out 70 or 80 bars of bullion every 24 hours. The bars vary from $250 to $600 per ton in silver. Since the first of June these works have turned out about 45 tons of bullion, the highest assay of which is 275 ounces per ton.

Water is a scarce article, and the lack of it has compelled even the one furnace mentioned to suspend operations a large portion of the time. Hence the talk of moving the ores to some point in the valley below to be worked. Two furnaces have already been erected, but both are unpropitiously located. One of them—the Swansea Smelting Works—is just below Cerro Gordo, near the lake shore. It is the property of a New York Company, and was planned after the manner of eastern companies, without any certainty of water for the works, or any definite plan for obtaining ore. So much for furnaces, with the suggestion that a good furnace, properly located, seems to be the best investment for capital in this district.

NEVADA COUNTY.

Bowery Mine.—Grass Valley *National*, Sept. 1st: The owners of this mine, near Deadman's Flat, are making arrangements to increase their facilities for hoisting. They expect to take out one hundred tons of ore for crushing, within the next month. The last two crushings paid well.

Meadow Lake.—*Transcript*, Sept. 2d: The furnace, built after the fashion of a lime kiln, for the purpose of roasting rock to be treated by the Burns' process, is completed and was to have been charged on Wednesday. Two pans have been put in the California mill for working the process.

Eagleson & Co. have struck a ledge, the rock from which assays $91.50 in gold, and $4.50 in silver. The rock is to be tested by the new process.

Union Hill Mine.—Grass Valley *Union*, 7th: For the last month the Union Hill mine has yielded about $12,300 worth of the precious metal. The profit is about $6,000. The shaft is down 260 feet; drifts are being run at the bottom of it, while sinking is still to go on.

Empire.—The Empire Co. are taking out rock from the Rush & Laton ground, south of the main shaft. The ledge is from eighteen inches to two feet in thickness, and shows well in sulphurets. The new incline on the Rush & Laton ground, is down 200 feet, and has separate hoisting works to raise the rock through it. In the main works of the mine, from the 800 foot level, splendid specimen rock was being taken on Saturday.

Kansas.—*Gazette*, 7th: This Co., who have been for some months prospecting for the Nebraska lead, and struck rich gravel a week or two ago, are removing their machinery to a convenient point for sinking a permanent shaft. The old channel was found further on the north side of the ridge than was anticipated.

PLACER COUNTY.

Oak Swamp Ledge.—*Stars and Stripes*, Sept. 2d: This claim, near Ophir, owned by J. Shindler and Pete Emig is panning out finely. One day last week the owners struck a small pocket, from which they took forty-seven ounces of gold in two days.

Good Yield.—Last Thursday, Messrs. Puffer & Sweezey, owners of a quartz ledge near Newcastle, had seventy tons of rock from their claim crushed at Schnabel's mill, which paid at the rate of $36 per ton, or $2,500.

PLUMAS COUNTY.

Black Hawk.—Quincy *National*, Aug. 28th: Turner, Rice & Co., have finished cleaning up, and have made from ten to twelve dollars per day to the hand for the season's work. They have been working four or five men most of the time. They have good ground enough to last for years.

Sawpit.—This is the liveliest mining camp in the county. Most of the tunnel companies are getting out pay-dirt, and the hydraulic claims in that vicinity are being put in readiness for the coming water season.

Claremont Hill.—Siler & Myers are getting out timbers in readiness for winter. This Co. has been at work eight years. Their tunnel is nearly 1,000 feet in length. They are certain that they are on an extension of the "Blue Lead," and that another winter's work will put them into "pay gravel." Several other claims have been located near them, and the companies are waiting for developments.

Rich Quartz.—Dr. Coleman, of Black Hawk, has discovered a quartz ledge, in his claims. Specimens from it show a large amount of free gold, and good wages can be made crushing the quartz in a hand mortar. The ledge is a large one.

Mill Creek.—Several companies are getting good pay, and have flattering prospects. Baker & Co. are averaging five or six dollars per day to the hand, and last week picked up a nugget weighing $75.

SAN DIEGO COUNTY.

The *Union* publishes an assay certificate by John Hewston in reference to rock sent to San Francisco by some prospectors in that county. The value of the ore is given at $295 per ton of 2,000 lbs. in silver, with a trace of gold.

SISKIYOU COUNTY.

Klamath River.—Yreka *Journal*, Aug. 27th: This district is beginning to "pan out" again after the old style. F. Riley & Co., who have been for the last fifteen months running a tunnel under the river without seeing the "color," have at last struck the channel and the gold in flattering prospects. They find the "sink" at the point at which they strike it as rich as at any point on the river. One pan of earth shown us by Riley produced some six dollars, with every reason to expect as good for a long distance. The gold is water deposits in cement.

TUOLUMNE COUNTY.

Confidence Mine.—Sonora *Democrat*, Sep. 4th: The new 20-stamp mill is pronounced by competent judges the most complete mill in the county. It is now running, and from all indications its first "clean up" will be a handsome one. About 160 tons of splendid rock are now lying at the mill ready for crushing.

Arizona.

Montgomery Mine.—Prescott *Miner*, Aug. 2d: Work has ceased for the present, there being an insufficiency of water to run the arastras, and the Indians having burned the cabin at the mine. We learn that Mr. Genung, the owner, intends, also, to commence work on another lode, the Sutler. To this end he was engaged in negotiating with Allen Cullumber, of Walnut Grove, for the use of his power, wheels, etc, The Sutler is in the Walnut Grove district, and prospects well.

From Wickenburg.—Capt. Hargrave and Judge Rush arrived Wednesday from Wickenburg, and report business tolerable lively; both quartz mills running.

Big Rebel.—Parties recently from Walnut Grove, inform us that T. Lambertson was crushing quartz from the Big Rebel lode.

The Sterling.—The Sterling mill was to have been started this morning, to try the new stamps. It rained heavily a day or two ago, and we learn that there is now plenty of water for milling purposes.

Prospectors Back.—The prospecting party, under Dickason, got back early this week. They prospected in the Black Mountains, and found little more than the color.

Bigelow & Harris moved their "traps" from their mining claims on Lower Lynx Creek, to town, one day this week, having become tired waiting for water.

Chase Mine.—A. O. Noyes worked recently by Paul & Wood process, a small quantity of Chaso tailings, and the result was pleasing. Another test will soon be made. We cannot say more now, than that it is thought success will crown Mr. Noyes' efforts to work our sulphurets.

A Prescott letter to the Petaluma *Argus* says: White Piners are beginning to come in, with the intention of prospecting; and that one of them told the writer that he had found rock which closely resembled that of Treasure Hill.

Colorado.

Winnebago Mill.—*Herald*, Aug. 25th: George Barrett has started up this mill on custom ore from the Gunnel and Mammoth lodes. He is hoisting the water at the rate of 40 gallons per minute.

Sterling.—Hartwell & Eagan are working the Sterling lode, at Georgetown. In sinking the discovery shaft they took out over $1,000 worth of ore. They have also a shaft 50 feet west, which shows a vein of four inches of $1,000 ore, besides an 18-inch streak of second quality.

Nelson Plumb is erecting a 15-stamp mill on Quartz Hill, for custom work. He has a thousand cords of ore ready to run, that will yield $30 or $40 per cord.

New Boston Lode—Griffith District. A shaft has been sunk 170 feet, and a cross tunnel driven from below, which cuts the vein at the bottom. The vein, as far as developed, shows a continuous sheet of mineral which assays from $39 to $80, and is large enough to keep all the mills in the county supplied.

Gold Hill District.—*Register*, Aug. 26th: Some 20 men are taking out ore enough to keep one 10-stamp mill and two arastras in operation. Blake & Tucker are cleaning out the discovery shaft on the old Hope lode. The last taken out, at a depth of 50 feet, run eight ounces per cord, and the parties working it say that they left a good vein of ore in the bottom. A little work has been done on the Williams lode with flattering results. A small lot of ore from Brierly's claim yielded 12½ ounces per cord. A sample of the iron gave a result of 25 ounces gold and 60 ounces silver per ton,—a coin value of $594.75. The Hoosier lode is being worked in one place only—No. 5 north—where they have a wide vein of rich ore. The mill is undergoing alterations in the machinery, but will be in operation again this week. Payson Gleason's 6-stamp mill, on Four-Mile, is about ready to start up.

Snake River.—*Register*, 26th: Mr. Packard, from Montezuma, reports mining matters in a flourishing condition. The St. Lawrence S. M. Co. have men getting out timbers for a building to be occupied by two reverberatory furnaces, having a capacity of eight tons per day. The tunnel is in 50 feet. The vein is three feet thick. A test of one-half ton of the ore gave at the rate of $106 per ton. The Napoleon lode, below the Silver Wing, opened with a tunnel 50 feet long, shows a solid ore-vein of galena eight inches thick. The crevice is five feet between walls. The ore run, gave at the rate of $113 per ton. Work is stopped on the Belmont lode, to give an opportunity for rebuilding. On the Haucock lode, the shaft is 40 feet deep. Belmont No. 2 has a tunnel 160 feet long; crevice, four feet. The richest streak is nine inches wide, and assays 572 ounces of silver per ton. The Wilson lode has a tunnel 50 feet long. The Democrat promises well. Assays show $125, $165, and $175 coin per ton in silver. One thousand four hundred pounds run by roasting and amalgamation showed $65 coin per ton in silver. The Stephen's lode is being worked by Professor Dibbin. Two tunnels, one 30 feet, the other 40 feet in length, and about 75 feet apart, are run in on the vein five feet between walls. The John T. Harris lode has a tunnel 94 feet long. Twenty-seven fathoms have been backstoped. The opening is 25 feet high and 44 feet long. The crevice is four feet. One-half of all that is taken out is first-class ore. About 100 tons of first-class ore are piled up. On a line, 750 feet below, is the International lode. The tunnel is 270 feet long on the vein, and three feet between walls. One-half of the entire width is first-class ore.

James Creek District.—Denver *News*, Sept. 1st: We have received a handsome specimen of ore from the Wanlan lode, James Creek district, Boulder County, owned by Mr. Mallory and others. The specimen shows free gold with pyrites.

The Wilson steam stamp mill at Black Hawk, is running day and night in the most satisfactory manner.

The *Miner* states that L. Huepeden & Co. have just finished the reduction of 73 tons of second-class Equator ore, that gave a total assay of $10,514.92 coin, the average assay per ton being 111.04 ounces; coin value, $144.04.

Idaho.

Wagontown Placers.—Owyhee *Avalanche*, Aug. 28th: There are several men already on the ground. We washed several pans of dirt and found from one to three cents in each. Water is scarce at this season; will be abundant about April 1st. Indications are good for this to be a thrifty camp next season. We would not be surprised to see 300 miners working on the creek before the middle of next summer.

Flint District.—*Wave*, Sept. 3d: The Twilight mine is being worked by a joint-stock company. They have a road built from the mine to Black's mill, and are taking out ore. They intend to crush about a hundred tons as a trial, and if they like it will continue.

Loon Creek Diggings.—*World*, Aug. 26th: Jacob Romer, just in from Oro Grande, says this will prove one of the richest and most extensive districts yet discovered. The best claims had been taken up by the first crowd who got in there from Lemhi and Montana. Several quartz veins have been taken up, and parties are daily prospecting for rich strikes in that line of mining. Mr. Romer estimates the number there when he left at 600, and more were daily coming in. The trail from Leesburg is very difficult and dangerous. A dozen pack animals had been precipitated from high, sharp points on the mountain side down into ravines, and killed, and their cargoes lost. Goods will have to be packed in from this direction. Jack Kennaly has a very rich claim. One man had panned out $117 in a single day; another had obtained nearly $20 from a single pan of dirt taken from a depth of five feet. The news produced another excitement here, and another stampede has been the consequence.

Judge Beatty writes to the Boise City *Chronicle*, from Leesburg, that everybody had gone to Loon Creek, and he should himself start at once. He says the prospects are from five cents to $18 per pan; and that one piece weighing $9 was reported. Another Leesburg letter to the Helena *Gazette* is equally favorable.

The *World* mentions among those who have left Idaho City for the new diggings, Joe. A. Luckett, Rube Peyton, Tom. Britten, E. D. Holbrook, John Gorman, John Burns, G. Tickner, and John Claresy.

Montana.

Brown's Gulch.—*Republican*, Aug. 27th: We were yesterday shown several beautiful silver bricks, made by Chas. Yeater, from ore in the Black lode, Brown's gulch. The ore was first run through a small arastra, then smelted in an ordinary fire, by which process both the silver and gold are saved.

Conner's Mill will commence running some time next month.

WIGWAM GULCH.—Mr. Frank Morgan, exhibited to-day a specimen of gold which equals that of Alder in richness. Harbert & Co., own 3,000 feet, 500 of which is flumed. Shellebarger & Co., have 2,000 ft. and have just commenced to build their flume. Manning, Wilbur & Co., own 3,500 feet. They have commenced fluming, and average $6 per day to the man on the rim. They have two feet of shoveling before reaching the channel. Our city company, composed of Dr. L. Daems, Chief Justice Warren, Dr. Mussigbrodt and others, own 5,000 feet of ground. They have already completed 450 feet of fluming. Less than 200 feet more will reach bed-rock, when they will commence taking out gold.

STRUCK IT RICH.—Helena *Gazette*, 26th: The company who have been running the lower drain on Trout creek struck it rich a few days ago. The drain is 100 feet deep, and cost the company two years hard labor, and over $25,000. As high as $500 have been offered for claims, we are informed, and refused.

DEER LODGE.—The *Independent* says: The James Stuart mill, at Phillipsburg, is crushing ore from the Hope ledge....French gulch is turning out well. Mr. Campbell will soon bring in another ditch.

PETERSON GULCH.—*New North-West*, 27th: This recent discovery, six or seven miles from town, has some 45 or 50 claims staked, and fair prospects are being obtained. Owing to there being no water at present, but few claims are being opened. C. B. Adriance & Co., have not struck the main channel, but in nearly every shaft have seen "color."

A GOOD INVESTMENT.—There is in the vicinity of Pioneer City at least five square miles of rich ground. Within the five miles are Gold Creek, Willow Creek, Pike's Peak, and Dry Gulches, Pilgrim, Pioneer and other bars, known to contain good pay. The ditches now built are inadequate to furnish the amount of water that is needed. A ditch can be built from Race Track Creek—25 miles or less—for $80,000 to $100,000. The greater portion of it can be plowed, and there would be less than 200 yards of fluming. The ditch would pay 25 to 40 per cent. per annum. Who is the man that will build it?

Nevada.

COPE DISTRICT.

GOOD QIELD.—Elko *Independent*, Sept. 4th: Mr. T. F. Fuller, of Cope District, shipped to Dall's mill at Washoe, two weeks ago, 7,200 lbs. of ore from the Mammoth and Grant ledges, and had it all worked together. The yield was at the rate of $256 per ton. The cost of hauling the ore to this place from the mines was $40 per ton; from here to Reno $9.50 per ton; and from Reno to the mill $10; making $59.50; to which must be added $50 for working, making a total cost of $109.50 per ton for working the ore, which of itself would be a handsome yield if worked at the mine.

ORE FROM COPE.—Sixty-one sacks of ore, from the Argenta mine in Cope, weighing 6,174 lbs., for shipment below, arrived in town on Thursday. John Enright, expressman, came in yesterday, and brought with him some very fine specimens of silver ore. One piece from the Mountain City, was literally covered with horn silver.

INDEPENDENCE MINES.—The placer mines in Independence Valley, near the northern end of the State, have been sold to a company of Chinese who are now building a road from Carlin. The mines are extensive, but do not pay large wages.

QUARTZ MILL FOR ELKO.—Thos. Bronn, now in the assaying business in this town, has made arrangements for the erection of a quartz mill as soon as the material can be got on the ground.

HUMBOLDT.

UNIONVILLE.—Correspondent Elko *Independent*, Sept. 1st: The Arizona continues to give out rich ores, and mining both on the extension and the original is better and richer than ever. About one-half the quantity now mined is worth over $400 per ton, and is selected for shipment to San Francisco.

The Seminole Co. are still prosecuting work on their tunnel, which is now in 540 feet. From calculations based on recent survey, they expect to cut the first ledge of the series within 25 feet. The tunnel is worked by contract.

The Alpha mine, four miles from Unionville, has been sold to an English company. The vein has been traced two miles, and several companies owning locations are developing them. Sacramento District is attracting attention. The Rochester Co. is prosecuting work on its claims, with encouraging prospects. Work is progressing on the Tallulah, in Dun Glen, and operations will be commenced on the Monroe after the 15th inst.; at which time the interest of the Humboldt River Co. in the mine will be sold under foreclosure by mortgage.

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

OVERMAN.—From the Gold Hill *News*, Sept. 4th: We have reliable information to the effect that some very good ore was found yesterday, in the drift north from the 500-ft. level, but not much of it is to be taken out at present owing to bad air. It is said to assay about $60 per ton. A very large body of lower grade ore exists at the 500-ft. level, which breasts out 60 ft. in width. An assay of it made this morning showed $43 to the ton. The yield of the mine is increased to 60 tons per day, averaging about $20 per ton; 63 men employed in and about the mine.

HALE & NORCROSS.—Owing to repairs being completed, the yield is greatly increased, nearly 200 tons per day being taken out, over half of it from the lower level. In the winze being sunk from the 4th to the 5th level, the vein is now three ft. in width, all high grade ore, averaging $72 per ton; the winze is 63 ft. deep.

SIERRA NEVADA.—The clean-up on the 31st turned out well. A drift west in the surface workings develops a large quantity of excellent ore, well sprinkled with free gold. Another good streak is found in the upper tunnel, three ft. in width, and widening.

CHOLLAR-POTOSI.—This mine continues yielding well, 225 tons of ore per day being taken out—assays averaging nearly $70 per ton.

IMPERIAL-EMPIRE.—The repairs to the shaft are completed down to the 1,080-foot station, and drifting southward.

GOULD & CURRY.—The old upper workings are yielding nearly 40 tons of ore per day, averaging $38 per ton.

TWIN.—This little mine, at Silver City, yields about $10,000 per month. It is a gold vein, from a foot to three and four feet in width, and the ore is worked at the Ione mill, and arastras on Carson river.

YELLOW JACKET.—There remains yet 16 ft. of mud and water to get out of the north shaft before getting down to the track floor of the 700-ft. level.

VIRGINIA CONSOLIDATED.—Shaft 171 ft. deep to-day. The new hoisting works operate well. Very little water is encountered as yet.

OPHIR.—The drift west at the 700-foot level is now in 572 ft. from the shaft, with nothing new.

HEAVY SHIPMENT OF BULLION.—Last Friday night there was shipped from the office of Wells, Fargo & Co., Virginia, 3,055 lbs. of bullion, worth $93,702.13, and by the Pacific Union Express, bullion amounting to $5,735.14; total, $99,527.27. This is the heaviest single day's shipment of bullion from this section which has been made for several months. A large proportion of it was, of course, from our Gold Hill mines.

ITEMS.—*Enterprise*, Sept. 5th: Amount of ore raised in the Yellow Jacket during the past week, is 1,683 tons....In the Lady Bryan, 40 tons of $25 ore raised daily.... In the winze, a 5-ft. vein of gold-bearing ore has been developed, which will assay $200....New pumps in the Hale & Norcross will be in place by the 23d inst.... Fire in Kentuck entirely extinguished, and prospects flattering.

WHITE PINE.

WEEKLY MINING REVIEW.—*News*, Sept. 4th: "The improvement in mining affairs still continues. The number of hands employed is increased every week. But for the lack of milling facilities the quantity of ore shipped would be doubled, as several of our best mines—the California, Aurora South, Eveniag Star Consolidated, and Pogonip and Othello—are sending no ore to mill, and have large quantities accumulated on their dumps. The first three belong to the Stanfords, and have 2,000 or 3,000 tons awaiting the completion of the Stanford mill, which will be running in about two weeks with 30 stamps, and several other mines are awaiting better and cheaper facilities for milling. Should the winter hold off late, the number of stamps will probably be increased to about 200, which will be kept busy all winter, turning out bullion at a rate of at least $100,000 per week. The Tom Paine mine, recently purchased by a Chicago company for $20,000, has been sufficiently opened to develop a well defined east and west ledge, over 12 ft. in width. The ore is of high grade, showing largely of horn silver and chlorides. The mine is 300 ft. below the crest of the bluff, and midway between the Eberhardt and Hidden Treasure. The bullion shipments aggregate $61,606.54, being something less than the amount last week."

ITEMS.—*News:* Aurora South is working 50 or 60 hands....Aurora Consolidated is sending 40 tons to mill daily. The Earl mine, now the property of the same company, is yielding largely of high grade ore. ....Five or six men employed in the Bromide tunnel....Consolidated Chloride Flat is employing 125 men, and sending 50 tons to mill per day....Eberhardt is working 25 men....Evening Star Consolidated only five at present....Fifteen on Eclipse Consolidated....Industry declared a dividend last week of 20 cents per share; the third in two months....Mammoth works 16 men, and takes out 10 tons daily....Mazeppa takes out four tons per week of ore worth several hundred dollars per ton, and 10 tons of second class ore....Manhattan works 16 men. It has been bargained to an Eastern company, we believe....Sagebrush works 24 men, and takes out a large quantity of good ore daily.

LOOKS LIKE BUSINESS.—*News*, 4th: A Cincinnati agent came out and bought several mines and interests in mines, on the Hill. He bought the Big Smoky mill, and removed it to a mill-site at the foot of the hill, near Hamilton. The mill cleared its cost in 30 days, and ground enough has been sold from the mines to clear the cost of all the purchases; so the company has property marketable at a million dollars, and all cleared in a little over two months time.

IMPORTANT TRIAL.—In the early part of next week the most important trial ever prepared in this district will be called in the District Court. This is a contest between the Rathburn and Hidden Treasure companies. The claims are in line, and they lap some 350 ft.; and it is for this portion that the suit is brought. This portion however, includes that ground wherein the Original Hidden Treasure has made its best developments.

UNFAIR CRITICISM.—The *Empire* of Sept. 1st, deprecates the sneering tone of some of the interior papers,—and while admitting the fact that times are harder than they ought to be, considering the regular bullion turned out, asks the Reno *Crescent*, if it ever heard of a White Pine mill that did not make more money than any other mill? After crediting the present depression to the condition of financial affairs in San Francisco, it closes with advising everybody who is discouraged to emigrate to Lander or Washoe!

MILLS.—*Empire*, Sept. 1st: Mr. Tregloan's new mill machinery has all arrived, except the pans which are hard by. The stamps, 10 in number, will weigh 850 lbs. each....The Treasure Mill (Big Smoky) crushed during August, 817 tons of ore, which yielded $78,777, or $96.50 per ton. ....The Kohler mill is being increased to 20 stamps. In 20 days the new 60-horse power engine will be in place....The damage done to the Dayton mill, which was wrecked by the tornado of the 28th Aug., is about $2,000. The delay will not exceed two weeks, and the mill will steam up about Oct. 1st....The Manhattan mill, 24 stamps, is kept in constant operation.

OUTSIDE DISTRICTS.—The 15-stamp mill will be in operation in two weeks....In Sacramento District, a negotiation is pending with a San Francisco company for a series of ledges, consisting of the Oro Fino, Sacramento, Boston, and La Plata. To test the quality of the rock, a ton has been taken from a depth of eight feet, in the Sacramento and Oro Fino ledges. the rock to be worked in San Francisco; and if it works in mill $25 to the ton, the company is to pay the locators $40,000 for the property. It is one of the conditions of the sale, that Dr. Hall, who acts for the San Francisco company, is to build a mill in Sacramento District, and do custom work. This is now the point on which the early prosperity of the district turns—if the sale goes, and the machinery is shipped out this fall, Sacramento is all right.

Oregon.

BURNT RIVER.—Dalles *Mountaineer*, Aug. 27th: Judge McCoy arrived on Monday from the "Big Ditch." A contract has been made with Chinese firms to complete the ditch to Camp Creek, 23 miles farther. This will be done by the middle of October. There are nearly 200 men at work. The Judge is satisfied that the region will be one of the richest on the Pacific slope. The length of ditch already completed is 45 miles. The capacity is 1,100 inches.

A Mr. Copeland is reported to have discovered a rich silver-bearing quartz ledge in the Willowa district, Baker County.

QUARTZ.—*Oregonian*, Aug. 28th: The Jordan Creek quartz lead, 2½ miles from Cañonville, is being prospected by Messrs. Gordan, Lord, Levans and Abrahams. They have sunk a shaft 60 feet, and are about to commence tunneling. They have an arastra erected, and have already crushed several tons of the rock, from which they took gold enough to place the richness of the lead beyond question.

VANCOUVER MINES.—Thomas Johnston has returned from these mines and reports unfavorably. He says that it will cost $5 to take out two bits.

DYNAMIT HEADACHE.—We clip the following from the San Francisco editorial correspondence of the N. Y. *Engineering:*

"The headache experienced by those who employ nitro-glycerine in any form as an explosive, doubtless arises from the presence in the air, after explosion, of particles of the original substance, not consumed, just as in the smoke of powder we have an evidence of imperfect combustion. The less visible smoke remains, therefore, after a blast of Giant powder, the less time will be required for its effects on the air to disappear. Proper adjustment of the charges to secure absolute combustion is a matter bearing directly on the same point. Few mining captains have yet found out how small a charge may be advantageously employed. The almost universal mistake in the use of this explosive is overcharging the holes. (*The useful effect of a blast does not increase in the ratio of the amount of the explosive*—least of all when the explosive is a *quick* one.) Even if Giant powder gave noxious fumes, the evil could be reduced to a minimum, and would be far less serious than those experienced in quicksilver, arsenic, or even common metallurgical works. But the general evidence is, that after becoming accustomed to Giant powder, no one suffers from it."

COMPRESSED-AIR DRILLING AT THE HOOSAC TUNNEL.—A correspondent of the Rochester (N. Y.) *Union* gives an account of a trip through the tunnel. He says: "Before entering the mountain, we examined the works at the river's side, by which the tunnel is making its way toward North Adams. We found, in a building called the 'Compressor House,' four immense air-condensing machines, each working four cylinders, by which air is driven through a pipe more than a mile into the tunnel, and there made to do the work of steam in drilling the rock at the 'heading,' as the remote end of the tunnel is called. Such a wheezing, puffing, and groaning you never heard air make. And no wonder. It was obliged to be crowded into an immense number of atmospheres, and made to travel 5,700 feet through an 8-inch pipe, and jerk and twist a steel drill into a vein of quartz rock almost as hard as adamant. It labored very severely to do this work, so when we get our short trunk line from Rochester to Boston, we cannot be too grateful to the vigorous air which gives us the Hoosac Tunnel. We must also thank Deerfield River, which is all used up in working the compressors."

CHUBB AT THE WOLVERHAMPTON EXHIBITION.—An English exchange has the following: "The display of Messrs. Chubb & Son is, without doubt, the *chef d'œuvre* of the section. Among the locks, none is, perhaps, more noteworthy, as an embodiment of artistic skill, than one in the Florentine style, the works of which are encased in polished walnut, ornamented by richly cut steel of beautiful and elaborate design, and burnished to the highest point of excellence. Chubb's patent "detector" locks are displayed in all the newest styles of design and ornamentation, and one, by way of curiosity, is set as a "jewel" in a gold finger ring. This is nearly as great a marvel of ingenuity as the lock said to have been made in Elizabeth's reign by a noted smith yclept Mark Scaliot, which lock, according to the veracious chronicles of tradition, consisted of eleven pieces of iron, steel and brass, all of which, with a pipe-key, weighed only two grains of gold."

JAPANESE MECHANICS.—Some years ago, when our Government made the Japanese a present of several Dahlgren boat-guns, they went to work and used them as patterns after which to make others. It is not unlikely that the mining machinery above alluded to may be intended ulteriorly to serve a similar purpose. In addition to the practical application just alluded to of the guns, the smart mechanicians copied in the same manner a Sharp's rifle which accompanied the others; and not only this, but they added an improvement for lifting the hammer automatically by the act of opening the breech for loading.—*Artisan.*

OUR AGENT, Wm. H. Murray, is now on a tour through Siskiyou, Trinity, Shasta, Tehama, Butte and Yuba counties, and will look after the interests of the PRESS on that route.

San Francisco:
Saturday Morning, Sept. 11, 1869.

Notices to Correspondents.

J. G., San Andreas.—We some time ago gave a diagram of the deepest mining shafts in the world, the deepest (now disused) being in the Tyrol. According to a notice in a recent Lancashire paper, of which we subjoin an extract, it would appear that the deepest mining shaft now at work is to be found in that county: "At the Rose Bridge Collieries, Ince, near Wigan, Mr. Bryham, manager to John Grant Morris, Esq., has just proved the seam of coal known as the Arley, at the enormous depth of 810 yards: At this pit, on the 3d of March, 1862, the celebrated Wigan cannel was (in this belt) first found, at a distance of 600 yards from the surface; lately the Yard mine was found at 673 yards; and now, seven years and a half after, the cannel, the valuable Arley, has been struck at the depth already stated. The sinking of the last 200 yards has been prosecuted in the night only, as the cannel had to be wound by the same shafts in the daytime. One is sixteen feet and the other twelve feet in diameter, and their construction has been unattended by any accident whatever. It is stated that the Rose Bridge deep pit is now the deepest perpendicular shaft in the world, and that it works the deepest mine yet proved in Britain. When the "dib hole" at the bottom is sunk, the total depth will only be three score yards short of half a mile.

ESAU.—The earliest notice of iron works in Britain is to be found in the commentaries of its earliest Roman invaders. According to Cæsar (De Bello Gallico, V. 12), iron rings of a certain weight were in use, as well as brass, for money. It is stated also that in small quantities, iron was found in the maritime parts of Britain (by which is understood the present county of Sussex), probably obtained from the Hasting iron sand-beds. At a later Roman ago of British history, small iron forges were employed in the Forest of Dean, at which place, amidst the scoriæ, debris and ruins, are found occasionally at the present day, fibulæ, images and coins of Trojan and the later emperors. As the woods became consumed in the south of England, the iron trade gradually settled in the coal districts. Perhaps not more than a couple of small furnaces now use charcoal for reducing the ores of iron; and these are only to be seen in Furness, where the red hematite is so largely found.

MINER, I. T.—Had you given the date of the item referred to, we might answer. For the address of a builder of an efficient safety-cage, see item in another column.

FOREIGN PATENTS.—Frederick Wittram, of San Francisco, California, has made application for an English patent, for an invention of "Improvements in Screw Propellers."

Scientific Impossibilities.

We propose to make brief mention of some of the scientific *ignes fatui* which have from time to time danced provokingly before the eyes of truth-seekers, but have always eluded their grasp, even when apparently within easy reach. Not having been actually demonstrated to be absolute impossibilities, they are assumed to be possible; and each victim fondly imagines himself destined to be the fortunate man who shall win imperishable fame by the long-sought solution. Leaving out of the question the old-time search for the "philosopher's stone,"—which should transmute, at the will of its holder, all metals into gold;—and the "elixir of life," which should secure to its fortunate possessor perpetual youth,—we begin with

The Squaring of the Circle.

The finding the length of one side of a square which shall contain the same area with a given circle, has for centuries engaged, more or less, the attention of mathematicians. The difficulty lies in the fact that no whole number will give the proportion which the circumference of a circle bears to its radius. It can be expressed only approximately; and is usually given as 3.1415. But the four decimals which form a part of this number have been, by patient labor, extended to more than *six hundred*, without reaching exactness; and although of course approaching nearer and nearer to the truth as the array lengthens, might undoubtedly be carried up to as many millions, without precisely giving it. So much for the arithmetical expression of this proportion. The determination of it by geometrical construction is now generally admitted to be equally impossible. There is an infinite element in the question. The ratio between two lines, one of which—the circumference—has neither beginning nor end, is not measurable by finite figures.

A Perpetual Motion Machine.

Another dream of these sanguine searchers after the impossible, is a machine which shall contain within itself its motive power, and which, without external aid, shall continue in operation until worn out. Years have been wasted in attempts to produce such a machine, and mechanical talent which, exercised in a proper direction, might have achieved much, has been thrown away. The progress, however, which within the last half century has been made in physics, and the enunciation of that grandest doctrine,—that of the "Conservation of Force,"—has effectually disabused all scientific minds of the notion; and it is now confined to those self-taught and too self-reliant individuals, who ignore "the books," and depend on "mother-wit." It is now known that *force*, like matter, is indestructible; and that throughout all its changes in form, or mode of exhibition, it is always to be accounted for in full. The motion which is at any time its result, is always resolvable into some other kind of motion. Thus, the motion of a bullet fired against a wall, is converted into motion of the particles of the bullet and of the wall, which motion is more or less rapid as the force was greater or less with which the bullet was projected; and may be so rapid that these particles will separate to a greater or less distance from each other,—perhaps so far, indeed, that the bullet will become liquid. That is to say, the force may be changed into heat. If the force of the bullet be applied to the putting a machine in motion, only such portion of it will be available for that purpose, as is not expended in heating the bearings of the machine through friction. The machine originates no force; it simply determines the manner in which the force shall be exhibited. As, then, a portion of the force is constantly wasted by friction, and as a machine without more or less friction is impossible, the force will at last, unless constantly renewed by outside agency, disappear entirely, *as force*, and the machine come to rest. A perpetual motion machine is therefore an impossibility.

Laboratory Protoplasm.

The hope of ultimately solving the problem of "life," in the laboratory, is in our belief another *ignis fatuus*. A recent lecture upon the "Physical Basis of Life," by Professor Huxley, a scientist of merited eminence and unquestioned sincerity, has given rise to much remark. He takes the position that all living matter has unity of composition; that the "protoplasm" or primordial substance from which the simplest organisms are evolved, is essentially the same in both the vegetable and animal worlds; that while the animal is dependent for this "matter of life" upon the plant, the plant elaborates it from mineral compounds; and that these compounds are carbonic acid, water, and ammonia,—produced by the union of carbon, oxygen, hydrogen, and nitrogen, in certain proportions and under certain conditions. From these data, he looks forward to the conclusion that there is no reason why we should not be able to manufacture protoplasm *ad libitum*, as soon as we have made ourselves acquainted with these *certain conditions* aforesaid.

Now we have no fault to find with Prof. Huxley's premises. There is no doubt that, so far as chemistry can show us, the contents of the minute nettle-hair are made up from the mineral compounds above-named, as well as are the colorless corpuscles which we find in the drop of blood just drawn from the finger. Both are protoplasm. By the aid of a powerful microscope, we may see that both are in unceasing motion; that both have life. But these two substances are manifestly not the same. Each does its own work. One produces nettle-matter, the other muscle. What makes the difference? If Professor Huxley, by a judicious combination of carbonic acid, water, and ammonia, could produce a substance which, like one of these specimens of protoplasm, was endowed with the liveliest possible motion for an unlimited time, could he make it reproduce itself? What *is* itself, by the way? Is it the embryo of a cow? Or of an eel? Or of an onion? How shall he determine which it shall be? Does he suppose that, the materials remaining the same, forms of life are made different by different conditions, all of which conditions we may gradually acquaint ourselves with, so as to reproduce any given form at will? Or does he suppose that *any* form, *any* protoplasm, once produced in the laboratory, is indefinitely developable into the highest form of life, without external aid?

In either case, of course, man is made his own creator. The obvious inference is, that there is no higher being than man; that Law reigns Supreme; that there is no necessity for a belief in a personal intelligence which is the author of that law, and which, in accordance therewith, supervises the Universe. The necessary result of such a belief as this supposes, is the doing away with all such antiquated and ridiculous notions as those of right and wrong. The sanctity of an oath is a humbug; for an oath is an invocation of penalty for non-performance, to be inflicted by some higher power. A future life is a chimera; for man is a mere bundle of atoms,—a mere resultant of forces,—a mere aggregation of carbon, oxygen and the rest,—and his individuality ceases when that aggregation ceases. If such a belief were to become general, love—other than sensual—would become a mere name; and all emotions and sentiments of an exalted character would become impossible. Let those who hesitate to admit these to be the legitimate consequences of such a belief, coolly follow out the thing to its logical conclusion.

There are those whose inner perceptions are so completely "occluded" within the outer shells of carbonic acid, water, and ammonia which constitute their visible selves, that they will sneer at this kind of talk as due to a superstitious reverence for early teachings, and as unworthy of those who believe at all in such a thing as science. To such we would adopt a different tone. We would say, that *we* believe in an Infinite Personality because we cannot fill the hill without it; we cannot account for the phenomena in any other way. We see the necessity of an infinite element in the calculation of the world's problem, just as the mathematician sees the necessity of such an element in *his* calculations. No truth is more absolute than mathematical truth; yet the higher mathematics finds it necessary to admit into its demonstrations an element which cannot itself be demonstrated. In no other way than by supposing an outside influence, tending to act upon man, can we explain the fact that we are *free*. Every man *knows* that he is free to act as he likes. But suppose he was simply the resultant of chemical forces? He knows equally well that in that case he could *not* be free; for he must necessarily act in accordance with those forces. The existence of another balancing influence is thus in a manner logically deducible; and it is in the fact that in his action he has the choice between these influences, that his freedom lies. The fact of this choice is not incompatible with the other fact that the law governing his being are inviolable; for it places it in his power to modify that being, in accordance with those laws, to an indefinite extent towards perfection. The more he knows of those laws, then, the better. Science, therefore, is progress, for it teaches him those laws.

When Professor Huxley can explain why it is that a mixture of oxygen and hydrogen in certain proportions disappears when the electric spark passes through it, leaving in its place *water*, a substance totally unlike either,—a process which, as he truly says, we do not yet comprehend,—and which,—by the way,—is one of the first steps in the manufacture of protoplasm, water being one of the compounds necessary to start with,—it will be time enough for us to begin to believe that he is perhaps about to flash into life that protoplasm itself. When he can tell us why salt crystallizes in cubes rather than in any other form, exhibiting thereby an individuality—so to speak—of its own, impressed upon it by some other agency than that of man,—we shall believe that one small step is gained towards explaining those immeasurably higher individualities which reproduce themselves. But even should he produce before us a single cell, or a single particle of substance having vitality, with proof that it did not derive that vitality from previously existing life, we should still demand that he go farther; and prove, in order fully to make out the case, that the conception of an invisible Supreme Personality,—which *to us* seems the highest conception of which an organism is capable,—is one and the same thing, except in degree, with the suction by which the jelly-fish absorbs its nutriment.

A RELIABLE SAFETY CAGE.—The cable of the safety cage at the Crown Point mine broke a few days since, when 300 feet above the bottom of the shaft. The safety attachment worked admirably, arresting the fall within a few inches of the start, although the iron cable above, nearly 900 feet in length and weighing about a ton, came thundering down from the mouth of the shaft to the top of the cage. The cage and its load weighed 2,600 pounds. Had the cage been without any safety attachment both it and the car must have been dashed to atoms, and the shaft, in all probability, seriously injured. The cage, with its safety attachment, was made by Mr. Alexander McMartin, the head blacksmith of the works, and the severe test to which it has been subjected affords ample evidence of the faithfulness of his workmanship.

Running Bullion Down Stream.

We too often hear the expression, that mining on the Pacific, as a business, is a failure. That it has not yet paid back the amount which it has received as an investment in the erection of machinery and cost of mines, is no doubt true; but there are two things to be taken into consideration in this connection.

First, it has given employment to a vast number of our people. Second, we have been at fault, to a great extent, in *running bullion down stream.* Our most intelligent millmen admit the fact, that, on an average, taking the States of Nevada and California, the returns by working does not exceed one-half of what the ore contains, as determined by careful assay.

The fault then, cannot be that the ore does not contain a sufficiency of the precious metals; but that our system of working the ore is not up to the requirements of the business. The fact that one-half of the metal is run down stream, is ample proof of improper working, and affords a matter for deep consideration. It is one, indeed, which might, with propriety, become a question for national legislation.

The several U. S. Mining Commissions have condemned the present mode of working, in strong terms, and suggested the idea of interference on the part of Government with our wasteful use of the people's patrimony. It would seem, however, that individual interest should exercise as much care in this respect, as Government might enforce; and yet it does not.

There is one thing quite evident—we endeavor to work too much ore to the stamp, instead of striving to work up on percentage of metal.

The fact that the mine owner has erected stamps under which to pass the ore, and pans in which to grind and amalgamate it afterwards, should not be accepted as the whole question of getting the metal out; for though the ore may be rich in gold or silver, it may also contain some substance which renders the ordinary modes of treatment ineffectual in saving the same.

One of the troubles connected with this question of running bullion down stream, is the utter incompetency of too many of our mill and mine managers. Mining is not a mere business question, which any ordinary business man can conduct; but it is one which requires a mining education, in all its peculiarities, to be made a success. We have so often discussed this question, that it seems idle to waste further time on it. What cannot be changed by the loss of dollars and cents, it is hard to change by talk. A correspondent, on the second page of the present issue, makes some pertinent remarks in reference to this matter.

The evil must correct itself; and we trust the present depressed condition of the mining interest will aid in bringing about such a result.

The time was, when if one owned a mine, he had prospects of wealth; but owning a mine now is received as having a tendency to reduce a rich man to poverty; and yet the mines figure up largely in value, when we take the average assays, and measure the cubic feet of ore in the mine.

One remedy for the betterment of the mining interest is the avoiding of needless expense in machinery. With large mills, too much low grade ore is put through in order to keep the mill running; whereas, with smaller mills, there will be more care in selecting. Small mills and careful assortment of ore, is something which is quite too little considered in both gold and silver mining on the Pacific Coast. Everyone knows that small pans generally produce better results, on the average, than larger ones. The reason is, because more care is taken with the former.

Up to this time, Californians have hardly realized the value of gold and silver in the rough. A five-dollar piece they will take good care of, after it is coined, and at the same time run off $100, in their mining operations, with less consideration than the five dollars would receive, if it had slipped through a hole in their pockets. This wastage should be stopped—less ore should be worked, and that which is treated should be worked better. In so doing, we think mining can be greatly improved, and, indeed, made the best and most legitimate business on this coast. Such a result, however, cannot be reached so long as we continue to run the bullion down stream, at the rate of 40 to 50 per cent. of what the ore contains.

Agricultural Fair Week.

A gala week at Sacramento, which was not unlike the usual previous annual agricultural jubilations at that place, held in the interest of the most honorable and independent of productive occupations, since 1850, closes with the issuance of the present number of our paper—while the Mechanics, Manufactures and Commercial Fair of the Pacific slope, is just on the eve of opening at the metropolis by the sea. Sacramento appropriately represents the interior, its agriculture, its legislative organization, and the grappling of Californian spirit with adverse material elements,—our conquest of space by the completion of the Pacific Railroad. Never have we seen the State Capital, nor indeed the State in the interior, so auspiciously and hueyantly jubilant as during the gala week of the Fair just closed.

The State Fair is a part of California. Its wonderful fruits, and great grape clusters, its figs, almonds, oranges, and pumpkins all brobdignagian, must be seen by one before he can say he knows much about California; its superb stock congregatious, in the perfection of which our large rancheros have manifested a kind of furore of emulation, constitute one of the peculiar features of our individuality. Splendid horses have been diligently sought out, and systematically distinguished by munificent premiums since our earliest days of farming in these treeless soils. Have you never been to the State Fair? That is impossible if you are a Californian, for every Californian has.

Tens of thousands of people, on the grand stand, or in the mazes of Agricultural Hall, testify that in population already we have a great interior. Often rusty but substantial-looking faces, and comfortable presentments, indicate the honest, sturdy, and prosperous condition of our inhabitants of the interior.

The State Fair is much more now than it ever has been heretofore, because railroads from four quarters of the compass, now pour in daily armies of excursionists, at excursion fares, even from distant points. Think of half a dozen car-loads of visiters to the State Fair creeping up the banks of the Truckee, and pouring at early morning through the sag of Donner Pass, like a summer fog over the Coast Range, from the Pacific; and then think of the banks of the Truckee in 1863, when not a mark or trace of man was there. Elkoans and Salt Lakers, and Chicagoans, New Yorkers, and Bostonians mingle, to such an extent that one is obliged to re-set one's eyes, in reading the frequenters of to-day, at the State Fair. Yet those queer fish who presido at gambling tables are still on hand and noisy as of old. We glide away from the State Capital by railroad, over a level plain, which we now see presided over, as we look back, by a grand dome, reminding us of the golden one of St. Petersburg. The clatter of the engine on the rails seems to be at the rate of about fifty miles an hour—and thus to San Francisco, by way of Stockton and Livermore Pass.

That the State Fair must make itself an "institution," would become evident by a glance at our peculiar agricultural interests. The men whose names figure in connection with it, who contribute to the State Agricultural Society's valuable reports, do great honor to themselves and good to the country. In the proceedings of that Society we find the information that we need on Land Reclamation, on Silk, and Wine and Tea.

It is needless to compare the last Agricultural Fair with previous ones, for all the Fairs are much alike, and improvement in departments is the gradual growth of years, noticeable only by old and careful observers who have been attendants for a considerable period.

We are satisfied with the size of the products of the soil. But let the agriculturists of California make a little progress now in the building and beautifying of homes. The most unfavorable comment that is made by our eastern friends upon the merits of Californian soil and farming, is that there are not to be seen any more good and comfortable homes. We wander across the Great Basin, and the Plains, for a picture of the old sort. Why is it?

At the Pavilion.

The Mechanics' Pavilion just now is a scene of busy and most varied industry. Carpenters, painters, joiners and machinists are as busy as a hive of bees, getting things ready for the Exhibition which will open on Tuesday next. Many of the exhibiters are already engaged in putting their exhibits in place, or in preparing for that purpose the space assigned them. The printing press upon which the fourth volume of the DAILY FAIR PRESS will be printed, is already in place, and will be in operation immediately after the close of the opening address. This press will be run by one of H. B. Martin's newly patented oscillating engines, which will be put up for that especial purpose.

In many respects the Pavilion has been altered and refitted to the advantage of exhibiters, and for the pleasure and comfort of the thousands who will visit the Fair. Booths are being constructed in the upper gallery. The long Art Gallery has been divided into three rooms, which affords a chance for the classification of articles. The walls are to be lined with canvas, which will add much to the appearance of the rooms. The large fountain has been refitted and improved. It is contemplated building a new structure on the south side of the Pavilion, for the display of agricultural implements, and for the exhibition of the Pullman Palace Car.

Workmen are busily engaged in putting decorations in place. Bunting is being arranged in festoons along the galleries, under which are State shields and escutcheons. Between these are to be placed, in large painted letters, the names of celebrated scientific men and distinguished mechanics. Everything will be completed in time for the opening at eleven o'clock A. M., on Tuesday next, when the opening address will be pronounced by I. M. Scott, Esq.

RINGS ALL THE TIME.—A Detroit inventor has contrived an alarm-bell for locomotives, which, being actuated by the eccentric shaft, is caused to strike at every revolution of the driving wheel. In order that it may wear equally on all sides, the bell is made to partially revolve by the force of each stroke. In case of accident the railroad company can always prove that their bell was ringing according to law, that being the point most difficult to convince a jury, and the one which the railroads have the greatest difficulty in proving. Owing to the position in which the bell is placed—in front of the engine and about three feet from the ground—the sound can be distinctly heard about three miles in the day time, and by night four miles or more; the ground and the continuous rail, both excellent conductors of sound, assisting in carrying the vibrations.

The Patent Office and Inventors.

An "inventor" in New York City complains that there is much mismanagement and even swindling in the Patent Office at Washington. He says that when an inventor applies for a patent he is obliged to employ a patent lawyer—one of a "ring"—to draw up his papers, for which an exorbitant fee is charged, and to present his claim. Otherwise, his interests are delayed in the Patent Office, and after a long while his papers are returned for modifications, which are suggested, our correspondent says, in "such abstruse language that it is next to impossible for an ordinary man to penetrate its meaning." It is charged that the Patent Office clerks are in collusion with the patent lawyers to reject a claim, if possible, where the claimant does not employ a "ring" lawyer, and does not furnish spoils for division. In many instances, the poor applicant is thus driven to abandon his claim after entering his papers; and in such cases, if his invention is good for anything, it is very likely altered in some of its minor details, and then presented and readily patented by some friend of the ring.—*Herald.*

The above statement is being widely published in the newspapers in this country, and no doubt has been convincing proof to many of our inventors that there really does exist a prescribing element which prevents original inventors from obtaining their own patents. This we do not believe, and in fact it would require better proof to our minds than the mere say-so of a complaining "inventor" of New York City, that any such state of affairs does really exist. Patents are issued every week from the Patent Office to inventors on their own application, and it is frequently the case that the examiners give to inventors who have presented informal papers, sufficient hints, "free gratis," to enable them to properly correct and present them.

One fact, however, is frequently lost sight of by inventors. Patent business in its entirety is as much a study and profession as is the common practice of the law in our Courts; and this is necessarily so. It would be impossible to simplify and curtail the law and process to which applications are subjected, owing to the multiplicity of patents already in force; and it is clear to every person that it requires the strictest search and examination, in order to prevent duplicating patents already granted.

Occasionally an invention will be unjustly rejected; but there is always a remedy which can be applied and the inventor's rights secured; and if the suggestions made by the Office are in "such abstruse language," the inventor or his agent has a right to demand a more definite opinion or statement. That agents are more successful in their operations, is not in the least wonderful, for they have made the business a study, and are able to secure their clients' rights with greater certainty than the inventor himself.

A successful patent agent will in time secure an influence in his profession with the same certainty that an attorney at the bar, if successful in gaining his cases, is sure to acquire; and in this we see the operation of the same law that governs in any of the trades and professions. If an individual or firm is successful, we accord credit in proportion to their success; and the fact that they are successful does not prove that there is any "collusion" or "wire-working" at the bottom of it. Let inventors patronize reliable agents, who are successful, and whose success has given them an influence, and they will realize in the end greater benefit and have no fault to find.

CALIFORNIA TIN IN THE FAIR.—An important exhibit of ore from the San Jacinto tin mines, San Bernardino county, will be made in the coming fair. There will also be displayed, in connection with the concentrated ores, bars of the metal, sheet tin, and manufactured tin ware. We shall allude fully to the development of this new and interesting resource of natural wealth.

Mrs. Mary Somerville.

The *Edinburgh Review* properly pays the following tribute to this remarkable woman who has just published the work on "Molecular and Microscopic Science": "The world is not unfrequently called upon to admire the keen interest and powerful grasp which veterans foremost in the ranks of science retain in their various pnrsuits np to the latest moments of an advanced age. It is, however, we believe, a case without a parallel in the annals of science that a lady in her eightieth year should publish a work containing a complete review of some of the most recent and abstrnse researches of modern science, describing not only the discoveries in physics and chemistry, hut especially the revelations of the microscope in the vegetable and animal worlds. Before many distinguished cultivators of the sciences she loves so well were born, Mrs. Somerville had taken a place among original investigators of nature, as in 1826 she presented to the Royal Society a paper on the magnetizing power of the more refrangible solar rays. This communication is printed in the 'Philosophical Transactions,' and led to much discussion on a difficult point of experimental inquiry, which was only set at rest some years later hy the researches of Reiss and Moser, two distinguished German electricians, in which the action upon the magnetic needle was shown not to have been caused by the violet rays. In 1832 she published her 'Mechanism of the Heavens,' and in 1834 she became still more widely known hy the appearance of her 'Connection of the Physical Sciences,' and the 'Physical Geography.' These works have passed through many editions, and have been translated into several foreign languages; whilst in this country her services to geographical science have been recognized hy the award of the Victoria medal for 1869 of the Royal Geographical Society. In her work on "Molecular and Microscopic Science,' the gift of lucid description, so characteristic of the distinguished authoress of the 'Connection of the Physical Sciences,' is as conspicuous as ever; hut that which most forcibly strikes the reader of these pages is the extraordinary power of mental assimilation of scientific facts and theories which Mrs. Somerville displays."

MOSES G. FARMER—A TESTIMONIAL.—Our readers will remember this name, for we have before mentioned it in connection with the improved telegraph wire of Mr. F.'s invention. The Boston *Traveler*, says: "A few days since Moses G. Farmer, Esq., of Salem, Mass., was presented with a sardius, or red carnelian intaglio, of Sir Isaac Newton, estimated to be about 200 years old, hy S. W. Dewey, of this city, in consideration of his electrical investigations and inventions. This latter gentleman, in presenting it, stated that since being its proprietor he had often thought he would present it to Professor Morse, in token of the great good he had conferred upon the human family hy his telegraph inventions, but lately he had become convinced that Mr. Farmer, the inventor of the fire-alarm telegraph and the American compound telegraph wire, was eminently deserving of it. Mr. Dewey received the intaglio from a Mr. Bishop, late of New York, who received it from his father, who was a diamond setter to the sovereigns of England, France, Spain, and Portugal, and the records held hy him of the jewels he had in his possession were such as to leave no doubt as to the antiquity of the gift and the probability that it was taken from life."

Get Your Engravings

Made at the office of the MINING AND SCIENTIFIC PRESS in season for printing your circulars for the Mechanics' Institute Fair. Remember, a good engraving cannot usually be made in a day.

Parties who wish first-class wood cuts and electrotypes for illustration in newspapers, pamphlets and trade circulars, should call at once and examine specimens.

To Quartz Mining Companies.

To be sold positively within the next three months—the MINES, ENGINE, MILL, and entire Machinery of the TEMPLAR NO. 2 Quartz Mining Company, located at Indiana Ranch, Yuba County, consisting of—
One Steam Engine, 60-horse power, made by Burden, Brooklyn, New York.
Two large Boilers, in complete order.
One Eight-stamp Battery.
One Chile Mill.
One Cornish Lift-Pump, 6 inches, of superior make and finish.
280 feet of 5-inch Iron Suction Pipe.
One large Water Tank.
And also all of the necessary machinery, with Belting, Feed Pumps, Hose, Turn Tables, Cars, Ropes, Track Iron, Flumes, Plates, with Blacksmith Shop and all Tools and requisite implements to be found in a large and first class quartz mill.
The Company having ceased operations intend selling off their effects as speedily as possible.
For Particulars as to price, etc., address, by letter or otherwise, L. W. CAMPER, at Indiana Ranch; GEORGE B. HORNISH, Marysville; or K. W. HASKELL, Pacific Fruit Market, San Francisco 24v18-1m

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.
"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.
8v19 6m

HIBBERD, SANBORN & CO.,
STAIR BUILDERS.

Between Third and Fourth, San Francisco. Orders from the country promptly attended to. All kinds of Stair Material furnished to order. Wood and Ivory Turners. Billiard Balls and Ten Pins. Fancy Newels and Balusters.
6v19-3m

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low 16v17tf

Changing the Address.—No charge is made for changing the address of this paper. To give all necessary information, write us plainly as follows: "Change address of the *Mining and Scientific Press* from Mr. .. M .... P. O.,.... county, ... State, to Mr. .... at .... P. O.... County,.... State.... 186-."

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

The following is a revised list of books interesting to our more special readers. The newest and most complete treatises on subjects within the scope of this paper, including local maps, pamphlets of value, etc., will be added from time to time:

ABBOTT, GORHAM D.—Mexico and the United States: Their Mutual Relations and Commercial Interests..... 2 00

ANTISELL.—The Manufacture of Photogenic or Hydro-Carbon Oils, from Coal and other Bituminous Substances, capable of supplying Burning Fluids. By Thomas Antisell, M. D. 1 vol. 8vo.. 3 00

BANCROFT'S Guide for the Pacific States..... 50

BARSTOW—Sulphurets; What they are, How Concentrated, How Assayed, and How Worked; With a Chapter on the Blow-pipe Assay of Minerals: 1 vol. 12mo. cloth..... 1 00

BLAKE, W. P.—Annotated Catalogue of California Minerals. 8vo..... 50

BLAKE, (W. P.)—Report on the Precious Metals at the Paris Ex., 1869. (To be had through Members of Congress.)

BRACE, C. L.—The New West..... 1 50

BROWNE, ROSS—Mineral Resources of the Pacific States. San Francisco, 1868..... 4 00

BOURNE (John)—Handbook of the Steam Engine, Illustrated. 2 vol. 12mo, cloth..... 2 25

CADWALADER'S Map and Description of White Pine. San Francisco, 1869..... 1 50

COTTA, B.—Lithology. London, 1867..... 3 00

CONGDON.—Mining Laws and Forms of California and Nevada, and the Mining Ordinances of Mexico. 181 pp. 8vo; flexible cloth; 1864..... 2 50

CROOKS & ROHRIG'S Translation of Kerl's Metallurgy (not yet received here in full).... 6 00

CRONISE (W. H. V.)—Natural Wealth of California..... 6 00

DANA'S Manual of Geology. Numerous Illustrations. 8vo. half morocco. Philadelphia, 1867. 6 75

DANA'S Text-Book of Geology. Illustrated. 12mo, cloth. Philadelphia. (School Edition) 1864... 2 25

DANA'S System of Mineralogy. New Edition. 8vo. cloth..... 10 00

DANA'S Manual of Mineralogy. Revised edition, 1868..... 10 00

ELDERHORST'S Blowpipe.—Analysis and Determinative Mineralogy. Third edition, revised. 8vo. cloth. Philadelphia, 1866..... 2 50

EVANS—White Pine..... 25

FREY & WELL'S Topographical Railroad and County Map of California and Nevada.. 1 50

FEUCHTWANGER — Treatise on Gems..... 6 00

GOODYEAR'S Translation. A Treatise on the Assaying of Copper, Silver, Lead, Gold and Mercury, from the German of Th. Bodemann and Bruno Kerl. 1 vol. 12mo. cloth..... 2 50

HITTEL'S (JOHN S.)—Resources of California; comprising Agriculture, Mining, Geography, Climate, Commerce, etc., etc; the Past and Future Development of the State. 12m., cloth. 1 50

HOSKOLD'S Practical Treatise on Mining Land and Railway Surveying, Engineering, Etc. 1 vol. 8vo. cloth..... 16 00

KUSTEL.—Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada; also, a description of the General Metallurgy of Silver Ores. By Guido Kustel, Mining Engineer. Illustrated by accurate engraving. 1 vol. 8vo cloth..... 6 00

KUSTEL.—A Treatise on Concentration of all Kinds of Ores: including the Chlorination Process for Gold bearing Sulphurets, Arseniurets, and Gold and Silver Ores Generally. By Guido Kustel, Mining Engineer and Metallurgist. Illustrated with 120 diagrams on 7 plates. 1 vol 8vo. cloth..... 7 50

LAMBORN.—Rudimental Treatise on the Metallurgy of Copper. 1 vol. 12mo. limp cloth. Illustrated..... 1 00

MITCHELL'S Manual of Practical Assaying. 1 vol. 8vo. cloth..... 10 50

MAKINS.—A Manual of Metallurgy, more particularly of the Precious Metals, including the Methods of Assaying them. By G. H. Makins. 1 vol. 12mo. cloth. Illustrated by upwards of 50 engravings..... 3 50

MAPS—Of Oregon, Idaho, Mexico, White Pine, etc., can be had at Bancroft's and Gensoul's.

OVERMAN (Fred.)—A Treatise on Metallurgy; comprising Mining, and General and Particular Metallurgical Operations. 1 vol. 8vo. cloth. 7 50

PHILLIPS (J. ARTHUR) — Mining and Metallurgy of Gold and Silver. New edition.) 8vo. Cloth..... 15 00

PERCY (John). — Metallurgy; the Art of Extracting Metals from their Ores, and adapting them to various Purposes of Manufacture. Iron and Steel. 1 vol. 8vo. cloth..... 13 50

PLYMPTON—Practical Use of Blowpipe. 1868..... 2 00

Practical Use of the Blowpipe; being a Graduated Course of Analysis. 12mo. cloth. New York, 1858..... 2 00

SCOFFERN'S Useful Metals and their Alloys. 1 vol. cloth..... 5 60

SIMONIN, L.—Underground Life; or, Mines and Miners. Edited by G. W. Barstow, F. R. S. 180 wood engravings, 20 maps (colored), and 10 plates of metals and minerals in chromo-xylography..... 18 00

SIMONIN, L.—Underground Life, or Mines and Miners..... 18 00

URE'S Dictionary of Arts, Manufactures, and Mines. 2,300 Engravings. From last London edition. 3 vols. 8vo. cloth. New York..... 16 50

WHEELER & RANDALL'S Quartz Operator's Handbook. Flexible cloth, 12mo. San Francisco 1865..... 1 00

WHITNEY.—A Geological Survey of California. Report of Field Work from 1860 to 1864. By J. D. Whitney. Per. vol. quarto..... 6 00

YALE'S Mining Claims and Water Rights. 8vo..... 7 50

Any of the above Books will be furnished by return mail or express, on receipt of the price with postage added. Any other books desired will also be furnished at the lowest San Francisco retail prices. Address,

New Almaden Vichy Water,

(CALIFORNIA VICHY WATER.)

FROM THE SPRINGS,

NEW ALMADEN,

Santa Clara County.

F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.

OFFICE, 506 JACKSON STREET,

GENERAL DEPOT:

Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the venous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of this precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever;* Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever;* Gout, *when the patient is still able to walk;* Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

Ayer's Cathartic Pills,

For all the purposes of a Laxative Medicine.

Perhaps no one medicine is so universally required by everybody as a cathartic, nor was ever any before so universally adopted into use, in every country and among all classes, as this mild but efficient purgative *Pill*. The obvious reason is, that it is a more reliable and far more effectual remedy than any other. Those who have tried it, know that it cured them; those who have not, know that it cures their neighbors and friends, and all know that what it does once it does always—that it never fails through any fault or neglect of its composition. We have thousands upon thousands of certificates of their remarkable cures of the following complaints, but such cures are known in every neighborhood, and we need not publish them. Adapted to all ages and conditions in all climates; containing neither calomel or any deleterious drug, they may be taken with safety by anybody. Their sugar coating preserves them ever fresh and makes them pleasant to take, while being purely vegetable no harm can arise from their use in any quantity.

They operate by their powerful influence on the internal viscera to purify the blood and stimulate it into healthy action—remove the obstructions of the stomach, bowels, liver, and other organs of the body, restoring their irregular action to health, and by correcting, wherever they exist, such derangements as are the first origin of disease.

Minute directions are given in the wrapper on the box, for the following complaints, which these *Pills* rapidly cure:—

For **Dyspepsia** or **Indigestion, Listlessness, Languor** and **Loss of Appetite,** they should be taken moderately to stimulate the stomach and restore its healthy tone and action.

For **Liver Complaint** and its various symptoms, **Bilious Headache, Sick Headache, Jaundice** or **Green Sickness, Bilious Colic** and **Bilious Fevers,** they should be judiciously taken for each case, to correct the diseased action or remove the obstructions which cause it.

For **Dysentery** or **Diarrhœa,** but one mild dose is generally required.

For **Rheumatism, Gout, Gravel, Palpitation of the Heart, Pain in the Side, Back** and **Loins,** they should be continuously taken, as required, to change the diseased action of the system. With such change those complaints disappear.

For **Dropsy** and **Dropsical Swellings** they should be taken in large and frequent doses to produce the effect of a drastic purge.

For **Suppression** a large dose should be taken as it produces the desired effect by sympathy.

As a *Dinner Pill,* take one or two *Pills* to promote digestion and relieve the stomach.

An occasional dose stimulates the stomach and bowels into healthy action, restores the appetite, and invigorates the system. Hence it is often advantageous where no serious derangement exists. One who feels tolerably well, often finds that a dose of these *Pills* makes him feel decidedly better, from their cleansing and renovating effect on the digestive apparatus.

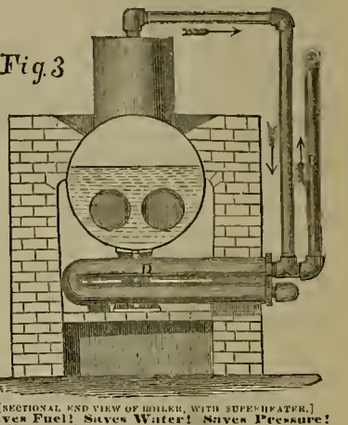
CARVALHO'S
Patent Steam Superheater



[SECTIONAL END VIEW OF BOILER, WITH SUPERHEATER.]

Saves Fuel! Saves Water! Saves Pressure!

Brief Extracts from letters from parties using Carvalho's Superheater. Full letters can be seen on application:

NAVY YARD, Washington, June 15, 1869.

"Superheater saves 12 per cent. in fuel and 10 per cent. more in speed of engine."

NAVY YARD, Washington, Oct. 8, 1867 (after *seven* years of service.)

"Superheater yet attached to boilers, and appears to be in good order."

HOWARD WATCH AND CLOCK CO., Boston, May 19, 1866.

"Superheater saves us at least 10 per cent. in fuel and gives a large increase of power."

JONES & SMITH, New York, March 21, 1867.

"Superheater saves 20 per cent. of coal, less steam pressure, exhaust more serviceable in drying paper."

STEAM ENGINE WORKS, South Brooklyn, April 23, 1867.

"Superheater saves not less than 20 per cent. fuel; no priming!"

CROCKETT LEATHER CLOTH CO., Newark, N. J., Oct 16, '67.

"Superheater economizes 25 per cent fuel; does our work with 25 lbs. less pressure steam, and steam superior for drying purposes."

N. Y. DYEING & PRINTING ESTAB., Oct 4, 1867.

"Superheater brings contents of our dye vats to boiling point in one-third less time and one-third less increase of water; saves us at least 15 per cent. fuel."

CONTINUOUS OIL REFINING CO., Binghampton, N. Y., Sept. 20, 1867.

"Superheaters give entire satisfaction, and we superheat to 565 deg.—an increase of 200 deg."

CAREW MANUF. CO., So. Hadley Falls, Mass., Oct. 17, '67.

"Superheater saves 15 or 20 per cent. fuel; steam for paper mill now perfectly pure and dry—an important advantage in our business."

STATEN ISLAND FANCY DYEING ESTAB., June 18, 1867.

"Superheater saves at least 25 per cent in fuel, and we have the advantage (hardly to be over-estimated) of perfectly dry steam."

ÆTNA IRON WORKS, San Francisco, Sept. 15, 1867.

"Superheater saves 25 to 30 per cent. in fuel; no priming."

CONTRA COSTA LAUNDRY, Oakland, July, 1868

"Superheater causes a use of 50 lbs. steam instead of 60 lbs.; use much less water, and there is a saving in fuel."

HAVILAH M. CO., Cal., August, 1868.

"Superheater causes a use of 40 lbs. steam instead of 60 lbs.; use much less water, and there is a saving of fuel." (2 sets.)

SIXTH MECHANICS' INST. FAIR, S. F. Sept. 4, 1868.

"Superheater used proves that it saves fully 30 per cent. in fuel." (Chief Engineer.)

NEVADA MILL, Virginia City, May 30, 1869.

"Superheater is a perfect success, and saves three cords of wood in ten, or 33⅓ per cent. in fuel; engine works better."

And many other letters of the same tenor.

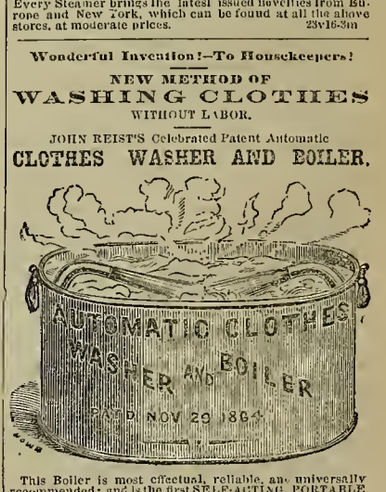
NEW METHOD OF

WASHING CLOTHES

WITHOUT LABOR.

JOHN REIST'S Celebrated Patent Automatic

CLOTHES WASHER AND BOILER.



This Boiler is most effectual, reliable, and universally recommended; and is the first SELF-ACTING, PORTABLE WASH BOILER, for household purposes ever made, and strange to say, has never been improved, as nearly all others, "which are infringements," have proved total failures. See decision U. S Patent Office, November 4, 1868. See its wonderful operation and you cannot do without it. WM. FRIEL, Agent for San Francisco, Dealer in Stoves and Tinware.
25v1 3m 67 and 69 Fourth st., bet. Mission and Jessie sts

The Pacific Railroad—Positively Open.—At last, rail communication between the Atlantic and Pacific is complete. On Mouday last, the first through train on the Western Pacific Railroad arrived at Alameda from Sacramento. The occasion was made one of great rejoicing. A large crowd met the train with cheers, which were lustily kept up until it had passed under the triumphal arch of flags and flowers that had been erected. Guns fired, locomotives whistled, bells rang, and everybody felt that something notable had taken place. The Alameda track is only to be used temporarily; the main line to Oakland will soon be completed. One who desires to make the entire journey across the continent by rail, avoiding the boat trip across the bay, can now do so by making the detour via San José.

Colorado Ore for Europe.—One hundred tons of ore have recently been started from Colorado, in wagons, for the Pacific Railroad, on its way to Europe, to be there smelted. It is thought that as soon as the railroad is completed to Denver immense amounts of rich ore will find their way by rail to New York, thence by sailing vessels to Europe, to be treated at the metallurgical works there. Such things ought not to be. The skill, means and labor ought to be found in our own midst, capable and willing to do such work at a cost and with a degree of perfection which will not admit of the shipment of our ores to foreign ports at such enormous expense as is necessarily involved in their transmission from the very center of the continent.

Emigrant Travel—Terrible Destitution.—The Elko *Independent* says that long trains of emigrants may be almost daily seen winding their slow and tedious way through that place toward California. A journey of 2,000 miles, through desert and wilderness, by the side of a railroad, seems something strange in this age of rapid locomotion. These emigrants, however, started before the present low rates for such travel were offered by the overland route. Second class cars and cheap fares will probably close out this mode of reaching the Pacific coast by another year.

The Silver City (Idaho) *Avalanche*, of a later date, says that terrible destitution and suffering exists among that portion of the emigrants *en route* for Oregon. Indian depredations, sickness and accidents are the cause of the suffering.

The Sutro Tunnel.—The Sutro Tunnel Co. has made an appeal to the public to subscribe to the stock in large or small amounts. They offer the unassessable ten-dollar shares at five dollars. The Virginia and Gold Hill miners' Union passed a series of resolutions on August 25th, in which, after a preamble to the effect that the miners are especially interested in the success of the enterprise, they agree to subscribe fifty thousand dollars in gold to the stock of the company.

Tree and Shrub Box.—Gustaf Gustafson, of Oakland, Cal., has patented an improvement in that class of boxes used by nurserymen and others for containing earth, in which small trees and shrubs are grown and preserved for transportation, and consists in hinging the sides of the box to the base or pedestal upon which they are placed, or which is used as a bottom to the box, so that they may be allowed to fall out and leave the earth, in which the tree or shrub is planted, free to be removed in a mass, which can then be done without disturbing the soil about the roots of the tree.

Admission Day—The Pioneers.—The Pioneers celebrated Admission Day, on Thursday last, with a procession and an address by John S. Hittell at the California Theater. The Second Brigade, California Militia, paraded and were reviewed by Major-General Allen.

Inventions and Patents.

New Patents Issued to Pacific Coast Inventors.

A Magnificent Chair for President Grant.—N. P. Cole & Co., the well known furniture manufacturers of this city, have just completed what is thought to be the most magnificent chair ever built in any part of the world. This chair has been built to the order of a number of gentlemen thoroughout the State, who, without distinction of party, have taken this means to present to the President some substantial testimonial of their regard. It has been made of California laurel, most elaborately carved and ornamented, and will be placed in the Mechanics' Pavilion during the Fair

Four Hundred Lives Lost.—A fearful colliery explosion occurred in Dresden, Saxony, on August 2d. The London *Times'* correspondent writes thus from that city Aug. 5th: "Early on Monday morning last, intelligence was received here that at a short distance from this city upwards of 400 men had fallen victims to a terrific colliery accident. At first it was hoped the numbers were considerably exaggerated, but it is now nearly certain that the figures will prove even greater, 420 or more being absent from the roll-call on Tuesday."

Frogs as Merchandise.—The San José *Mercury* says that great numbers of frogs are being sent from that neighborhood to the San Francisco market. "Boxes of these amphibious quadrupeds," says that paper, "are sent to San Francisco several times a week. It is getting to be quite a profitable business. They are raised from the seed, require little cultivation, considerable irrigation, and produce about four bushels to the acre."

A New Sleeping-Chair.—Hon. T. C. Theaker, the late Commissioner of Patents, has obtained a patent on a railroad sleeping chair of his own invention, which he will soon introduce into use. It is said to be a complete arrangement for the comfort of railway passengers.

The Powell Expedition.—A Salt Lake telegram of the 8th, says that Maj. Powell with the Colorado exploring expedition reached the north of the Rio Virgin on the 30th, having made a successful trip. Nothing necessary to the success of the exploration was lost.

Continental Life Insurance Co., 302 Montgomery street, corner of Pine.

Quarterly and Monthly Editions.

At the end of each quarter a large number of our weekly issues for the preceding three months are bound up in book form, which, by special arrangement, are placed upon the ferry boats and various steamers leaving San Francisco and other ports on the Pacific Coast, for free reading by the intelligent traveling public. The Quarterlies are also to be found in the principal libraries, depots, hotels, and free reading rooms of the Coast.

This, in addition to our Monthly Series and large weekly circulation, makes the Press the best and cheapest general advertising medium throughout the Pacific Coast. The value of advertising in our columns, however, is best determined by those who have tried it, and we respectfully refer to our patrons in that line. No paper in the United States can boast a better class, and no weekly paper on the Pacific Coast receives as large a sum for regular advertising, or has more constant or long-continued customers.

Call Attention

To the special merits of your articles on exhibition by advertising them in the Mechanics' Fair Daily Press. The paper has a wide and extensive circulation amongst the most live people of the day, and you and your wares will become known to thousands that would otherwise know you not.

Costa Rica Mahogany can be had on very reasonable terms of Hohls & Gilmore, Market street, near Beale. ***

To have a good look at the distinguished visitors from the East, and compare them with our own business men, use Muller's opera glasses and Brazilian pebble spectacles. ***

To the miner, farmer and mechanic—the three great interests that form the base and ground-work of all our prosperity—this paper should be considered as almost indispensable. We wish the Press boundless success in the future.—*Placer Herald.*

Returned.—Dr J. H. Paine, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. Howland.

Dr. Hall has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs. Curling, Oruit, Lee, Parker, Acton, Aitken, Churchill, Ricord, Velpeau, Boech, Sperino, and Dewitz. Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco 21v18-3m

Use Pain Killer for Cholera and Bowel Complaints, for Boils, Cuts, Bruises and Scalds, Old Sores, Sprains, Swelling of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Frosted Feet, Felons, **Sore Throat, Sudden Colds, Coughs, Etc.**

Use it for any of these, and you will never do without it. Its success as a valuable family medicine has induced others to initiate and counterfeit the Pain Killer to some extent. *Beware of Counterfeits!*

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

REDINGTON & CO., and HOSTETTER & SMITH, San Francisco, Cal., General Wholesale Agents

The Fourth Volume of the Mechanics' Fair Daily Press will be printed in the Pavilion, commencing September 14th. It will be distributed free to over **100,000** different persons, affording it a wide and immense circulation.

The Fair Press will contain eight pages, with many illustrations and interesting descriptions of articles on exhibition, amusing incidents of the Fair, and will form a very desirable first-class advertising medium. Advertisers will do well to secure their space early.

AN EXTRACT

From the American and Foreign Patent Agency Circular of the Mining and Scientific Press, Dewey & Co., Publishers.

U. S. Laws and Decisions relating to Patents.

[A BRIEF AND HANDY DIGEST.]

Design.—A patent for 3½, 7 or 14 years is allowed to any citizen of the United States who originates a new carving or sculptural composition, or a new shape or configuration of any article of manufacture, or a new ornamental or useful design, pattern or picture, to be worked into, or printed or painted, or cast, or otherwise attached to any article of manufacture. Government fee, $10, $15, or $30. [Act 1861.

An engraved or printed design issued as an object of art, having a value in itself, and intended for sale as such, properly comes within the provisions of the copyright law; but when, however artistically executed, it is not produced for sale as a work of art, but is designed to be affixed in the manner of a label to a manufactured article, it then plainly falls under the act relating to patents for designs, and consequently cannot be protected by copyright. [Bishop, Com'r of Patents, Aug., 1859.

Copyright may be obtained for 1st, Printed reading matter, forming ao part of any ornament or manufacturer's mark; 2d, Charts, musical compositions and prints or engravings intended for sale as such. [Act 1831, Sec. 1.

Extension.—Application for extension must be made at least three months prior to the expiration of a patent. The chief points to be established are: 1st, ascertained value of the invention; 2d, amount of loss and profit which have accrued from the invention: 3d, efforts made and difficulties incurred in maturing and introducing the invention. Application fee, $50. Issue, $50. [Act 1861, Sec. 10; Act 1848, Sec. 1.

Joint Inventors are entitled to a joint patent, but neither can claim one separately.

Assignments may be made previous to application, and should be recorded in the United States Patent Office within three months.

The Specification must set forth the invention in such full, clear and exact terms as to enable one skilled in the art to which it appertains, to compound and use it without making any experiments of his own. [5 Howard, 4.

A construction of patents liberal for the patentees is proper. But the description of the patent must be so certain as to be understood by those acquainted with the subject matter. 1 Wood, 53.

The omission to mention in the specification anything which the patentee knows to be necessary for the beneficial enjoyment of the invention, is a fatal defect; but the omission to mention something which contributes only to the degree of benefit, provided the apparatus would work beneficially and be worth adopting, is not a fatal defect. [Web. pat. cas. 317.

The language of the specification is necessarily that of the factory; the technical terms and expressions of the workshop must be used to order for a workman to understand the description to a patented invention, and these are often wholly incomprehensible to a judge and to other legal men until they are explained. [Carp. pat. cas.

Abandonment.—If an inventor (before application for a patent) knowingly suffers his invention to go into public and general use without objection, it is a dedication of it to the public. [4 Mason, 108.

No patent is held to be invalid by reason of the purchase, sale or use, prior to the application for a patent, except on proof of abandonment of the invention to the public; or that such purchase, sale, or prior use, has been for more than two years prior to such application for a patent. [Act 1839, Sec. 7.

Prior Description in a public work, if relied on to void a patent, must be such as would be sufficient to a patent. [Parker *v.* Stiles, M'Lean, Nov. 1849.

An Improver upon an original patent has no right to use the original, nor has the original patentee a right to use the improvement without license. [1 Peters, C. C. 399.

Legitimate Combination is where two or more parts act together in a new way with a useful result.

Mechanical Equivalent means a substitute known to the art.

The Product of a patented machine is not patent property. [3 M'Lean, 296-7.

Patentees are required to mark each article made or vended under their patent (or where this is impracticable, to mark the package) with the word "patented," and the day and year. But infringers who have been duly notified are liable, notwithstanding the omission of such marking by the patentee. [Act 1861, Sec. 13.

Penalty of not less than $100 and costs is incurred for each fraudulent marking of unpatented articles with the word "patent" or like phrase, or for unauthorized use of a patentee's mark. [Act 1842, Sec. 5.

The Invention, if new and useful to the public, may be the result either of long experiment and profound research, or of a sudden and lucky thought, or mere accidental discovery. * * * Luck, labor or inspiration gives an equal right. [Tindal, C. J.

The law, essentially practical in its judgments, looks only to the fruits of the invention, and if it finds there the indispensable features of novelty and utility, it will presume a sufficient amount of invention to support a patent. [Holt, Com'r of Patents, Oct. 23, 1857.

The right to the patent belongs to him who is the first inventor, even before the patent is granted; and therefore any person who, knowing that another is the first inventor, yet doubting whether that other will ever apply for a patent, proceeds to construct a machine, of which it may afterwards appear he is not the first inventor, acts at his own peril, and with a full knowledge of the law, that by relation back to the first invention, a subsequent patent may cut him out of the machine which he has erected. [2 Wash. C. C. 345.

The first inventor has the prior right, if he had reduced the invention to a practical form by drawing or otherwise, and has used reasonable diligence in adapting and perfecting it. [1 Story, 590-596.

The invention itself is an intellectual process or operation, and like all other expressions of thought, can in many cases scarcely be made known, except by speech. * * The conversations and declarations of a patentee, merely affirming that at some former period he invented that particular machine, might well be objected to; but his conversations and declarations, stating that he had made an invention, and describing its details and explaining its operations, are properly to be deemed an assertion of his right at that time, as an inventor, to the extent of the facts and details which he then makes known. * * The invention may be consummated and perfect, and susceptible of complete description in words, a month or even a year before it can be embodied in any visible form. [14 Peters, 462.

There is no doubt that he who has discovered some new element or property of matter may secure to himself the ownership of his discovery, so soon as he has been able to illustrate its practicability, and to demonstrate its value. His patent, in such a case, will be commensurate with the principle it announces to the world, and may be as broad as the mental conception itself. But the mental conception must be susceptible of embodiment, and must, in fact, have been embodied in some mechanical device, or in some process of art. The abstract must be resolved into the concrete. The patent must be for a thing, not for an idea merely. [Kane, J. U. S. D. C., Pa.

Secret Use.—The inventor, who from selfishness, indifference or caprice, wishes to withhold from the enjoyment of his fellow citizens a discovery which he has made, must see to it, that in burying his secret, he preserves proofs of its existence, ready to be produced, whenever the action of another and more generous inventor shall summon him to the issue. [Holt, Com'r of Patents, Nov. 1858.

A Part Owner of a patent may, in the absence of any contract, assign his interest, or any fractional part thereof, or he may either alone or in company with others, purchase or make as many machines as he pleases, and may sell them to others with the right to use or sell them; or he may refuse to sell them, and may rent them; but he has no power to control the action of, nor to exercise any supervision over, a co-proprietor, nor to compel contribution of profits or losses, nor to enforce a partition of the right, nor is either party under any obligation to make the property profitable. Such parties must be regarded as having interests which are distinct and separate in their nature, though derived from the same instrument; and having such interests, with the right to use them separately, they cannot, for any legal use of them, incur any obligation to each other. [Chapman, J. S. C., Mass., 1864.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and well established.

Patents obtained in England, France and Belgium will secure the rights of an inventor among many millions of the most enlightened people on the globe; it is therefore very important, if the invention is valuable, to secure foreign patents.

Persons desirous of securing Foreign Patents, should send for our Special Circular relating to Foreign Patents, which will be sent free.

Employers have no claim to the inventions of their workmen, unless it can be proved that such employee was specially hired to bring out such inventions.

WHEN correspondents desire us to answer by express, they should so inform us, and enclose a franked envelope, when convenient.

☞Our Illustrated Pamphlet, from which the above is an extract, will be furnished free on receipt of postage stamp. Confidential advice given, and every legitimate branch of Patent Soliciting business promptly and faithfully executed, by

DEWEY & CO.,

Publishers Mining and Scientific Press, 414 Clay street, San Francisco.

Job Printing.

We employ the best workmen in this department, and promise our customers—(many of whom have patronized the office for over eight years)—the best of work at very fair and uniform rates.

We are constantly adding new presses, type, and other material to our stock, making our facilities good for doing a wide range of work for merchants, mechanics, inventors, manufacturers, and tradesmen of all classes.

FOR ENGRAVING AND ELECTROTYPING, for illustrating books and circulars, we pay particular attention, guaranteeing our customers satisfaction in this line difficult to be secured elsewhere.

Printing in colors, bronze, plain and ornamental style promptly done. Especial care given to working engravings

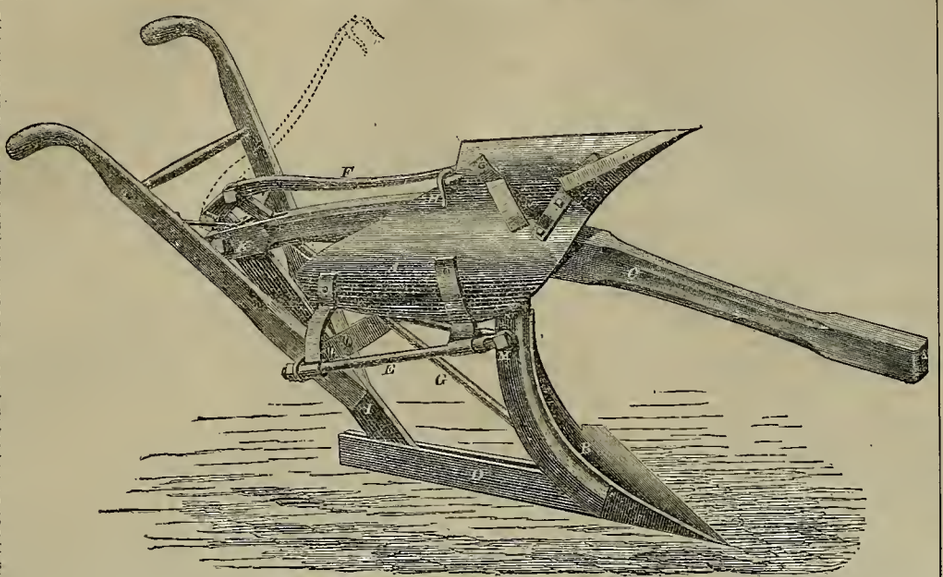
SCOVILLE'S CLIMAX SIDE-HILL PLOW.



The advantages claimed for this new Patent California Plow over others employed for similar work, consist in its being so constructed that the plow which is not in use is thrown up in such a manner as to rest its weight upon the beam, as shown in the engraving, where the plow A, is firmly held by the hooks upon the end of the iron arm, F. The weight of the upturned plow is thus made to aid in keeping the opposite plow to its work in the ground, while the balance of weight is so equally divided as not to give an excess on one side. Its position is also such that it does not in any way interfere with the plowing, and the person who holds the plow can see to handle it as readily as though the mold-board was not resting upon the beam. The handles are so arranged as to give to the holder a sure and easy control of the plow. The rod, G, is operated by the arm or lever, F, so as to lock the plow to be used in its proper position in the standard, by entering a slot in the toe of the land-side, D. When it is desirable to use a single plow (as on level ground) either of the mold-boards may be quickly removed by loosening the nut, M, and removing the rod, E, thus converting it into a single plow. The mold boards are hung upon two angularly-placed axles, one of which belonging to the plow not in use is shown at E, with its mode of attachment to the axis. The plow may also be used double, as for ditching, etc., by slipping a cap over the joint of both plows when in proper position. The mold-board being made of the best of steel, and of a peculiar shape and great acuteness of sheer, will free itself or scour in all kinds of soil, and requires fully twenty per cent less draft than any other plow of same size. It turns the soil so as to bury the stubble, and leaves the ground in a good condition for seeding. This Plow has been successfully introduced, the following parties, among others, already having them in use: J. J. Reed, Marin county; A. F. Scott, Centerville; George W. Shade, Watsonville; James McCormick, Pescadero; and J. J. Wood, J. B Gilchrist and J. E. Jones, of Spanishtown, San Mateo county, California.

TWO SIZES kept constantly on hand 10-inch and 12-inch cut, weighing 90 and 105 pounds. Price for each, $35, and with two extra Shares, $40. Will make any size to order. If, after a fair trial, the buyer is not satisfied, he can have his money back. Purchasers can depend upon every Plow being of good quality and make throughout.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hausbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

Pioneer Screen Works.

JOHN W. QUICK,

203 Fremont street, near Howard, San Francisco.

Screen Punching of all kinds and qualities for Quartz, Cement, Flour and Rice Mills, at greatly reduced rates.

ORDERS SOLICITED AND PROMPTLY ATTENDED TO.

I would call special attention to my slot cut and slot punched Screens which are attracting much attention and giving universal satisfaction, both as regards their efficiency and durability. This is the only establishment on the coast devoted entirely to the manufacture of Screens. It has furnished screens for the principal mills and firms on the coast for many years. 10v19tf

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the PRESS from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers or others will please inform us.

CHOLERA IN WATER.—A receat number of the *Standard*, has the followiug from Dr. Frankland: "It may be safely asserted, that the addition of cholera rice-water to the water of the Thames, in the proportion of 1 to 1,000, would not materially affect the results of the chemical analysis of the water. Thus the followiug experiments show two things: First, that water may become seriously contaminated with choleraic matter without the presence of the latter being indicated by chemical analysis; nnd, secondly, that water so contaminated is not completely deprived of this impurity either by tiltration or passago through nninal charcoal. On October 24th, 1866, a boy ten years of age was admitted into the Cholera Hospital, Commercial street, suffering severely from the prevailing epidemic. In about eighteen hours the youth died. Some of the rice-water evacuations of this cholera patient were collected, and came into the possession of Dr. Frankland. On being mixed with ten parts of distilled water, the flocculent matter which this fluid contained subsided, leaving an opalescent liquid above. One volume of the original rice-water was also mixed with 500 volumes of distilled water, and the mixture so formed was passed through filter-paper —a far more perfect filtration than nny which is available on a large scale. But the filtered liquid was 'still very opalescent,' proving that cholera matter still remained."

ROOFING TILES OF GALVANIZED IRON.—The *London Architect* thus describes a uew French roofing: "The coveriag is composed of separate tiles formed of galvanized iron, aud shaped somewhat like ordinary pantiles. The metal beiag thia, they are easily cut to fit a sloping line of roof, corners, etc.; and they are fasteued by a single nail of galvanized iron, with which is used a small leaden washer, to reader the nail hole perfectly tight. The advantages of such tiles are numerous. In the first place, they are not affected by fire, like zinc; they do not oxidize, and their dilatation aud coutractiou have no effect ou the roof."

A REFRESHING DRINK.—A tablespooaful of oatmeal, put into a large tumbler, or small jug, and filled up with clear, cold water, well shaken up and allowed to settle uatil the large particles of the meal fall to the bottom, forms a most refreshing drink in hot weather, and it quenches thirst more than any other. The iron puddlers, and other workmea, who have to bear the greatest amount of heat endurable by man, are always supplied with oatmeal water, both with satisfaction to themselves and masters. This fact deserves the attention of farmers and harvestmen.

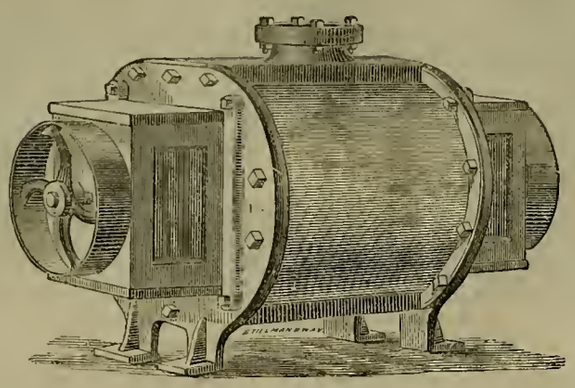
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

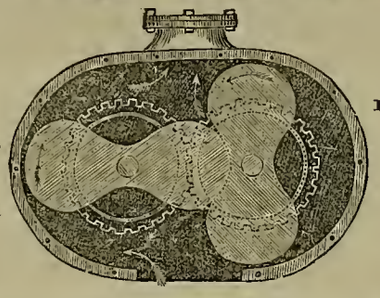
MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.



Awarded the First Premium at the Paris Exposition.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.



ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**

REQUIRES **Fifty Per Cent.** LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

VARNEY'S

PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the office, **229** Fremont street,

1v1 San Francisco.

REBELLIOUS ORES.

THE HAGAN FURNACE.

The above method for the purification of Rebellious Ores is respectfully offered to the public. Repeated actual workings show that the

HAGAN FURNACE

Will accomplish all that the Reverberatory Process will do, and at an expense that is merely nominal. It has never failed to treat any ore effectually.

It has never been claimed for it that it will extract gold from ores which do not contain any of that metal.

Parties owning rich but refractory veins, can treat with the undersigned upon the basis of

GUARANTEED RESULTS,

With responsible security. For an interview, and all desired particulars, address

HALL & LEE'S

New Method of Packing Stationary Joints in Steam Engines,

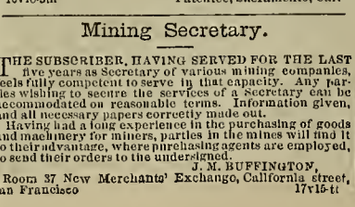
— AND ALSO IN —

STEAM AND WATER PIPES.

BY THIS METHOD OF PACKING THE JOINTS ARE made perfectly steam-tight inside as well as outside, thereby effectually preventing the steam from cutting into the joints of the steam chest. Consequently, an Engine packed after this method will last twice as long as it will when other Packing is used; and the joints may be opened and closed every day, and they will be steam-tight every time they are closed, and the same Packing will remain good forever. Consequently, owners of mills will make a great saving, both in time and money, by having their engines packed by this method. Patented June 8th, 1869. By permission we refer to A. J. Binney, Supt. Northern California Railroad, and A. D. Starr & Co., Proprietors of the Buckeye Mill, Marysville. State, County and Mill Rights for sale by A. H. HALL & H. T. LEE, Marysville, Cal. 6v19-3m

CROSS' COMBINED

Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Splers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

GAS! GAS! GAS!

MACHINES!

THIS MACHINE,

MANUFACTURED BY THE

Boston Union Gas Company,

Is the result of several years of experiment and investigation, until to sum the whole, we can warrant a perfect machine.

It is Simple in its Action

AND THOROUGH IN ITS CONSTRUCTION.

It will last a lifetime; requires not more than three minutes's attention a day, to wind up the weight; generates gas just as fast as it is wanted, and stops making the moment you stop using it; gives the

Cheapest, Softest, and Most Diffusive Light

yet discovered. It will make abundant gas from a cheaper and lower grade of fluid than

ANY OTHER MACHINE IN USE,

and works in cold climates as well as warm. Only those who have used Gas Machines know what this means. Complete or partial failure in cold weather has destroyed confidence in them more than all other causes combined.

The Union Gas Machine entirely obviates this difficulty by a simple contrivance, patented and owned exclusively by this Company, and by which we warrant each and every Machine to operate successfully in winter or summer in any climate or country. It is the only Machine that claims to work outdoors in cold climates, and the only one that fulfills the requirements of the insurance companies without increase of risk. For country residences you save the breakage of lamps, and your lights are always clean. Away from the city, a Gas Machine affords one of the most pleasant and valued of city comforts. Of the advantages of Gas Machines, you pay for no more Gas than you actually consume. People sometimes imagine they do this with a machine. It is impossible; and the same amount of light will not cost one-half the cost of coal gas, besides being much more brilliant.

Where the pipe is already in the building according to the regulations required by the coal gas companies, or where parties wish the entire work of piping fixtures and furnishing, Machine, etc., by us, we will do everything and warrant everything.

The following card from Mr. Atkinson, 538 Market street, who has been THE FIRST TO INTRODUCE this light in this city, will be read with interest:

SAN FRANCISCO, January 25th, 1869.

MESSRS. D. SIMPSON & CO., Agents of the Pacific Union Gas Company, 117 Sutter street—Dear Sirs: I have for the past two months been using the light produced by the "BOSTON UNION GAS CO'S GASOMETER," now for sale by the PACIFIC UNION GAS COMPANY, and am well satisfied to continue using it. I find that it is equally safe as city gas, more brilliant, and less injurious to the eyes. I formerly paid to the Gas Company fully **100** PER CENT. MORE than it now costs me to light my premises. Any persons who may wish to introduce this Light can call at my store, No. 538 Market street, and I will satisfy them as to its economy and merits. JAMES ATKINSON.

VORACITY AND STRENGTH OF YELLOW JACKETS.—It is astonishing to watch those troublesome insects, commonly known as "yellow jackets," and notice the heavy burdens which they will sometimes bear away upon the wing. They will often take up with their legs, pieces of fresh meat or fruit apparently equal in bulk to themselves, and fly off, with scarcely any diminution from their ordinary speed. They frequently prove very troublesome and destructive. The Oregon *Sentinel* says they have become a great pest in that vicinity the present season—so much so as to even attack the fruit upon the trees. The *Sentinel* speaks of an apple tree as having been almost stripped of its fruit by these voracious insects; while it is absolutely impossible to dry peaches or plums out of doors—as they are eaten up or carried away as fast as put out.

Crucibles.

The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco.
Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,
18v18-9p 519 Front street, San Francisco

Seventh Industrial Exhibition of the Mechanics' Institute.

Opening Day, Tuesday, September 14th.

The Board of Managers of the Seventh Industrial Exhibition of the Mechanics' Institute announce to the public that the FAIR PAVILION ON UNION SQUARE will open on TUESDAY, SEPTEMBER 14, at 11 A. M., with the usual ceremonies.

The success of the last Fair was beyond the expectations of the Managers, and the satisfaction to the public was acknowledged by all. In the coming Fair, numerous additional attractions will be presented. Applications for space to exhibit have been received from foreign countries and the Eastern States, and the Managers confidently predict an Exhibition never equalled in California. Steam power will be furnished necessary to drive all machinery.

The Pavilion has been improved in many respects, and now covers an area of 90,000 feet. A new gallery has been erected, and additional decorations will be employed. The Pavilion at night will be illuminated by 1,300 gas jets, presenting a magnificent spectacle.

A celebrated band has been engaged for the entire period of the Fair.

The restaurant and refreshment department will be in competent hands.

Admission:—Season ticket, admitting a gentleman and lady, $5; season ticket, admitting single person, $3; single ticket, 50 cents. Children, half price.

A. S. HALLIDIE, President.

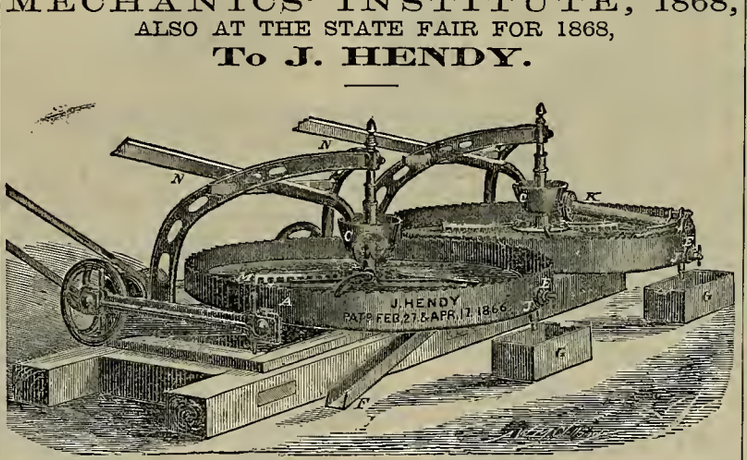
PREMIUM FOR BEST CONCENTRATOR
AWARDED BY THE
MECHANICS' INSTITUTE, 1868,
ALSO AT THE STATE FAIR FOR 1868,
To J. HENDY.



A LARGE NUMBER OF THESE
IMPROVED CONCENTRATORS
ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

OFFICE OF NORTH STAR MINE, GRASS VALLEY, NOV. 12, 1868.

JOSHUA HENDY, ESQ.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.

Respectfully yours, J. H. CROSSMAN, Supt. N. S. Mine.

J. HENDY, Patentee.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

MINING AND SCIENTIFIC PRESS.

A Journal of Useful Arts, Science, Mining, Farming, and Mechanical Progress.

BY DEWEY & CO., Patent Solicitors. SAN FRANCISCO, SATURDAY, SEPTEMBER 18, 1869. VOLUME XIX. Number 12.

Our National Pride, our Industrial Greatness.

The Capitol, with its sublime dome completed, with its great wings, and presided over by a colossal statue of Liberty—our land of a thousand great rivers, of uncounted horizons full of lofty mountains, embracing between them a continent which is bounded by the two great oceans of the World; an undivided Union, with a form of government as strong and enduring as the liberal principles on which it is based; our chief national characteristic and pride, the passion to triumph by our ingenuity over matter; our present glory the mastery of time and space by means of electricity and steam, which are our very playthings. These texts cannot fail to elicit a flow of glorification in one's breast, upon the grandeur of the Present.

Perhaps America, which we love always to regard as the

"Home of the free and the land of the brave,"

has attained, however, in these very days, the climax of her greatness; for great may be our future, and yet posterity will look back to these times as those of our most vigorous, world-acknowledged, self-conscious though unproclaimed, true national greatness, in placing ourselves in a picture of the history of nations.

No earthquake is likely, we feel confident, on the other hand, to topple down the nation's walls and capitols. Centuries will pass in prosperity, perhaps in peace, with here and there only a little turmoil of politics.

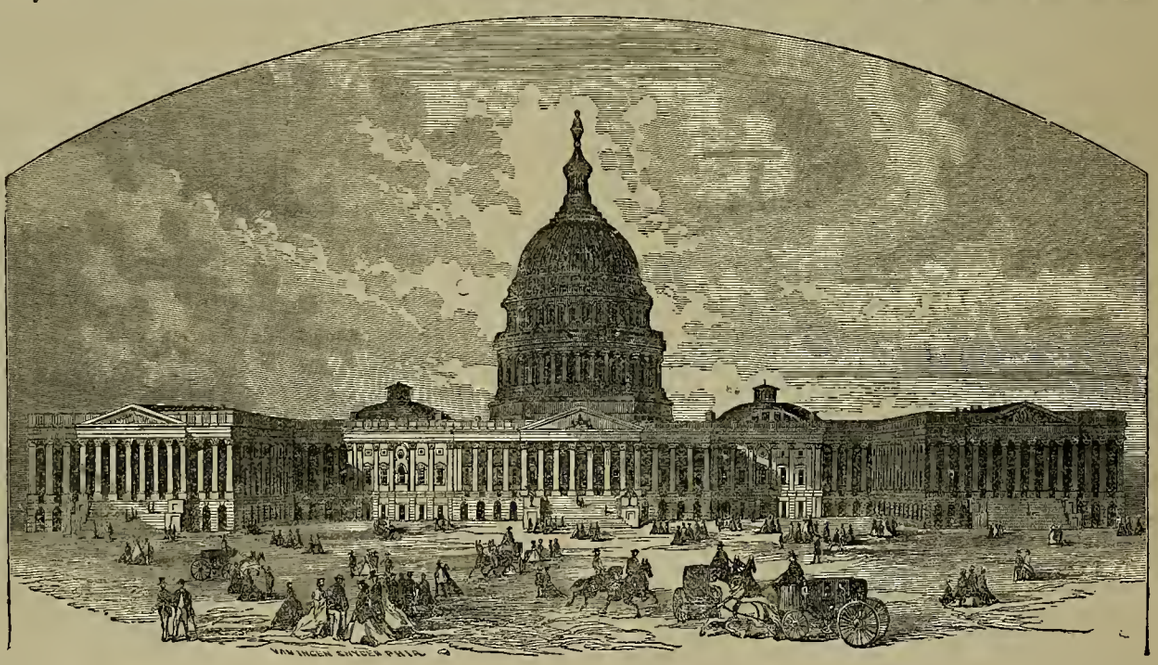
As you walk through our little Fair by the "sunset gate," remembering our triumphs, and noting the thousand evidences here displayed of inventive progress, reflect and glorify with all your soul in the greatness of to-day. This is *our* day; we live and move unconsciously in a Homeric age; our every-day life, our soil, and our pursuits, are steeped with romance and heroism.

The entire nation is represented here in this celebration of the westward march of Civilization and the Arts. The three golden links of Odd Fellowship constitute the motto of the occasion. We are incited to the cultivation of our finer fancies in our enjoyments; we are led by every visible object here to a study of problems of political economy and trade, of demand and supply. Such are the features of the Fair.

Our national structure is a temple of progress, both moral and material—from a personal and religious absolute independence, to a higher individual perfection in men. Our national greatness and pride is to enact a career of industrial and inventive progress worthy of that wonderful conception and mechanism Man.

The accompanying view of the National Capitol will remind those who have threaded the aisles of the department palaces at Washington of the fostering care that our legislative department has ever paid to devices suggested and brought forward for material progress. No other government that exists so warmly encourages invention and protects the inventor; no other country displays such numbers of well thought out and such ingenuity of inventions, as meet the eye of a visitor to the great United States Patent Office.

While our National Capitol serves as the appropriate text for these cursory remarks, let us add a few facts which should be generally known concerning the building:



THE NATIONAL CAPITOL, AT WASHINGTON, D. C.

The Capitol fronts the east, and stands on a plateau ninety feet above the level of the Potomac, in latitude 38° 55′ 48″ north, and longitude 77° 1′ 48″ west from Greenwich. The southeast corner-stone of the original building was laid on the 18th of September, 1793, by President Washington, aided by the Freemasons of Maryland. It was constructed of sandstone from an island in Acquia creek, Virginia, painted white, under the direction of B. S. Hallett, and afterwards of B. H. Latrobe, architects. The north wing was finished in 1800 and the south wing in 1811, a wooden passage way connecting them. On the 24th of August, 1814, the interior of both wings was destroyed by the British, but they were immediately rebuilt. In 1818 the central portion of the building was commenced, under the architectural superintendence of Charles Bulfinch, and the original building was finally completed in 1827. Its cost, including grading, up to 1827, was $1,746,717 33. The corner-stone of the extensions to the Capitol was laid on the 4th of July, 1851, by President Fillmore, Daniel Webster officiating as orator of the day. Thomas U. Walter was architect, and subsequently Edward Clark, under whose direction the work was completed in November, 1867. The material used for the extensions is white marble from the quarries at Lee, Massachusetts, with white marble columns from Cockeysville, Maryland.

The dome of the original central building was constructed of wood, but was removed in 1856, to be replaced by the present stupendous structure of cast-iron, which was completed in 1865. The entire weight of iron used is 8,009,200 pounds.

The main building is 352 feet long in front and 121 feet deep, with a portico 160 feet wide, of twenty-four columns on the east, and a projection of 83 feet on the west, embracing a recessed portico of ten coupled columns. The extensions are placed at the north and south ends of the main building, with connecting corridors, forty-four feet long by fifty-six feet wide, flanked by columns. Each extension is 142 feet in front, by 238 feet deep, with porticos of twenty-two columns each on their eastern fronts, and with porticos of ten columns on their ends and on their western fronts. The entire length of the building is 751 feet, and the greatest depth, including porticos and steps, is 324 feet. The area covered by the entire building is 153,112 square feet. The dome is crowned by a bronze statue of Freedom, modelled by Crawford, which is nineteen feet six inches high, and which weighs 14,958 pounds. The height of the dome above the base-line of the east front is 287 feet.

The legislative department of our National Government, in which the Pacific States are, of course, fairly and fully represented, will, at the coming session of Congress, devote far more than usual, and special attention—with the aid of due enlightenment from personal visits by members—to the mining, the lauded, the industrial and commercial interests of the transmontane West. Mining titles, mining laws, agricultural lands in mining regions, Mongolian emigration, manufacturing incentives and premiums, reciprocity relations with our Pacific neighbors—these are questions the handling of which will prove of mighty influence upon the welfare of our communities. Our national representatives, so far as we remember them, are: Cole and Casserly, Senators; Axtell, Johnson and Sargent, Congressmen for California; Stewart, Nye and Ashley, for Nevada; Geo. H. Williams, Henry Corbett, and Joseph S. Smith, for Oregon; Garfield, for Washington Territory; Holbrook, for Idaho; McCormick, for Arizona.

THE FIRST FAIR OF THE INSTITUTE was held twelve years ago, in a building erected for that purpose on the block now occupied by the Lick House, on Montgomery street. Each subsequent Exhibition of this useful and enterprising Institution has shown a steady increase and importance. The present display will hardly be complete before the end of the week; yet it is constantly thronged with crowds of eager, curious visitors. There will doubtless be an unusually large attendance of strangers the present season, from the interior, on account of the improved facilities now presented for traveling. We have now practically three railroad lines, reaching San Francisco from points radiating in various directions to almost every section of the State, each of which, as well as the steamboat lines, affords cheap and rapid access to the city.

APPLES, of all other fruits, are found in the greatest number of varieties. It is said that not less than 10,000 different varieties have been produced, although in some cases the distinction is very slight, and perceivable only by those most intimately conversant with such things.

OPENING ADDRESS

Delivered by Irving M. Scott, Esq., *in the Pavilion of the Mechanics' Institute, at the Opening of the Industrial Exhibition, September 14th*, 1869.

In arts, sciences and mechanical inventions, in manufacturing progrese, we bave our days of review—landmarks by wbich we observe every deviation from the usual path, every innovation upon established usage. Taking a hint from tbe past, courage from the present, we boldly strike into tbe future, with full faith that the result of our efforts will lift us above the plane of the past. This is the day set apart for us to review tbe victories of art, discoveries of science, and the advancing steps of invention; this is our commencement day, to notice the progress and improvements, perfection and convenience of our age; this spacious building, crowded with the trophies of peaceful labor, speake with the eloquence of action, the earnestness of our civilization. From these yearly comparisons, these mile stones of progress, we note the onward march of events. This day, for another and higher reason, should be the inspiration point for art and science to buckle on their armors and go forth to nobler conquests. One hundred ycars ago, at the Castle of Tegel, was born the great scientist, the explorer of tbe earth's surface, the expounder of the underlaying and overlying strata of its crust, the father of physical geography, the author of Cosmos, blending naturalist, artist, geologist and traveler in a wonderful degree. Humboldt is the Colossus on the field of scientific labor. His was a lifetime of work—and, measnred how we may, is unparalleled. Thoughts and ideas which he started, gathered strength as time sped, until he received the homage of the world. The years siuce his birth are crowded with the grandest achievements of man. [At tbis point the speaker paused, and the bust of Humboldt was unveiled, amid great applause.—Rep.]

Six years later, the Declaration of Independence tbrilled the heart of the world. In this democracy, arts and science received an impulse which carried them up to high-water wark. Steamboats, railroads, telegraphs, sewing machinee, cylinder presses, and a host of beneficent inventions came crowding from the brain of a Republic in which all men are equal.

We are celebrating our Seventh Exhibitiou in the Queen City of the Western slope,—a city whose foundations, rocked by earthquakes, washed by the waters of an ocean freighted with the richest memories of the oldest civilization, holding in her lap the wealth of continents, tied to the Occident with indissoluble bands of commerce and self-interest, and to the Orient with bands of steel aud a common ancestry, in whose harbor may float the navies of the world,—a city full-fledged, where all was primeval nature when Humboldt looked from Chimborazo's peak in 1802.

So rapid and marvelous has been thie growth, that the mind ecarce comprehends that half a continent has been reclaimed from savage rule, filled with people, interlaced with iron ways; and this, its outpost on the westward march, just nineteen years old, changing the current of exchange, dividing the world's commerce, and carrying the banner of progress "full high advanced." Seventeen hundred and sixty-nine was the date of Arkwright's first patent for a cotton spinner. Now one man spins more yarn than four hundred could in Arkwright's day.

As much flour is made by one man now as one hundred and fifty could make a century ago.

One woman makes as much lace as one hundred did in seventeen hundred and sixty-nine—and wears it too!

Sugar is refined in as mauy days as it once took months.

One hundred years ago, it took six months to fix quicksilver to glass; now forty minutes!

The tedious days of the sickle, followed by the flail,

"Throbbing mellow music down the vale,"

winnowed by the winds of heaven; the gleaner Ruth and the threshing floor of Boaz have passed away for a machine to the "manor born," which cuts, threshes, cleans and sacks the grain from twenty acres a day.

This progress is solicitous of man's comfort. In 1569, a bath of boiling oil was applied after amputation — a custom as barbarous as the age was uncouth. Theu came "reform and chlorcform," when every faculty rested, and the patient roused from slumber to find the dreaded deed done. Science, ever watchful, ever advancing, turns another page; freezes the parts operated on, with brain, heart, and nerves in full play; the patient, an observer of painless amputation, himself the subject.

In medicine, the days of blood a pint, and physic a quart, yield to reason and a knowledge of the laws of health. The "ounce of prevention" is recognized as the fundamental principle.

The age is liberal—the martyrdom of Latimer and Ridley is replaced with the unity of sects in the advancing march of Christian progress. In our infancy, Salem jail was crowded with suspected witchee, and Cotton Mather hurled his invectivee at Corey, whose four score years could not save him from death.

Less than a hundred years ago the terrors of the Cock Lane ghost shook England's faith to the center. *Now*, the iconoclast,—the common school,—knocks tbe idol of superstition to pieces; planchette is a household toy, painting the faces of absent spirits. And wbo's afraid?

Thirty-eight years ago Professor Low, of St. Joseph College, Bardstown, Kentucky, was dismissed for writing a pamphlet advocating a national railroad from the Atlantic to the Pacific. The Faculty judged him insane. *Now*, from this very city, we can step into a Pullman palace car, furnished with regal luxury, carrying our own provisions, travel across valleys, climb mountains, span rivers, and neither change cars nor stop for three thousand miles—over one country, having one language, protected by one flag;—and the builders of this enterprise we call tho ropresentative men of our day.

In eeventy-eight days of pleasure we can follow the sun around the world to our point of starting—instead of thirty-six months of tedious travel—carrying with us the condensed luxuries of tho land, and send our thoughts home on swift-winged messengers, the final result of Franklin's experiment—

"Through the shadows of the globe we sweep into the younger day;
Better fifty years of *our time* than a cycle of Cathay."

When we see the tenderness and liberality of to-day—the economy of time, of space, of machinery—we might think that half the world is idle. Progress has increased the demand for men, after all the improvements of labor and lahor-saving machinery. So rapidly have new fields and enterprises been devcloped, under the fostering hands of Art, Science and Invention, that not only has the demand for the individual increased, but ideas have become valuable. "A penny for your thoughts," says the old saw. Thoughts are worth more than pennies now, and ideas suggested hy thought are worth millions.

The man who caught the idea of making screws, gimblet-pointed, controls that commodity in the markets of the world. The man who got the idea of the clothes wringer, made money. The idea of making pins with eolid heads and rolling the points, overturned all England had contributed to that branch of industry, and made New England the pin's point of the world. The ideas of condensed milk, of condensed fruits, of the swinging cigar lighter, blacking boxes with wooden bottoms, wooden fruit boxes and sticking machines, led their inventors to the golden beam all men seek.

A peuny for your thoughts! For ideas that are shaping the world, uo more to be measured by a mercenary standard thau the influence of the sun or the blessing of free air.

The eye of the needle at the point—an idea conceived by Elias Howe—made the sewing machine possihle. We are all familiar with this household god, which lessens the labor of those we love, and have followed its shuttle, feed, hemmer, tension, tucker and stitch, through all improvements, until we behold a machine that will sew with harmony and precision seven hundred etitches a minute; too stupid to make a mistake! But it takes sixtcen seeonds to thread the needle,—a loss of time and labor which could not be afforded. A woman conceived the idea, and exhibits in this building, as her contribution to mechanical progress, a needle that can be threaded in less than a second—threaded without looking at it; threaded in the dark! Two years elapsed from the conception to the practical application of the idea, during which time many experts were consulted. Finally a sou of Asia applicd the idea, and we have the open-eyed needle of Mrs. Suplee, which is to the machine of the future what Howe's was to the machine of the past. The brain of a Caucasian, tho muscle of the Mongolian—prototype of what is to be—co-workers recording deeds of usefulness, the measure of which will enlarge their spheres,

Time is precious. Seven hundred stitches a minute is not enough. Progress is ameliorating. The physical effects, the fatigue of the treadle, must he abated. Stevens hears the cry, touches the lever with electricity, and quicker than thought twelve hundred stitches a minute respond. Feet unoccupied, treadle dispensed with. This open-eyed needle, driven by the subtle fluid, with its music of twelve hundred stitches a minnte, is California's reply to Hood's Soug of the Shirt.

The presence of a star is needed to explain a bend in the earth'e orbit. Astronomers' telescopes sweep the heavens until it is found—a star whose undimmed luster shone steadily from the beginning—undeveloped resources, hiddon for centuries, are discovered at the call of progress. Mines which have yielded tin for past centuries, now decreasing in quality and quantity, increasing in cost, until increasing demand paid double price, and yet not enough. While this decay was taking place in one part of the globe, to preserve nature's equilibrium, California was discovered, settled, prospected, and the tin mines of San Jacinto laid bare—lodes which yield 60 per cent. oros—a deposit that will change the current of tinwares, and make Temescal what Cornwall has been. This, the first exhibit of tin ever produced in the United States, was crushed, concentrated, smelted, run into pigs and bars, made into sheets, manufactured into tinware,—all done with California inventions in the city of San Francisco.

Slate, another article exhibited for the first timo as a product of this State, lay undisturbed, though trodden underfoot by the ceaseless throng who searchcd our placers, and worked our copper mines.

Inventors supplying with wonderful success, crushers, quartz mills, amalgamating pans, concentrators, smelting furnaces,—separating tho precious metals from obdurate matrices, with economy and speed, giving to the world a metallurgy peculiarly Californian; lead works making shot and pipe; woolen goods second to none; wooden wares supplying every want of this coast; rolling mills ready for the worn rails of a national road; foundries and shops capable of building sewing machines, or launching monitors; engineers bridging rivers, crossing mountains; leather factories furnishing soles to the solcless; native artists reproducing our varied seenery with fidelity; photographers, whose art makes the sun paint their pictures; inventors teeming with thoughts and ideas to meet this devcloping age; capitalists open-handed, moro liberal thau elsewhere;—all these and a thousand more meet our inquiries in the field of manufacture.

One million acres out of forty millions under cultivation, producing 14,080,752 hushels of wheat, 11,605,922 buehels of barley, 1,864,379 bushels of oats, 4,449,835 pounds of butter, 2,110,058 pounds of cheese, 5,229,826 pounds of wool, 1,983,068 bushels potatoes, 1,791,633 gallons of wine, more than 200,000,000 feet of lumher, 400 pounds of cocoons—three threads of their silk equaling five threade produced elsewhere, and the advantage of greater length—to say nothing of fruits and numerous other eources of wealth—meet our inquiries in the field of agriculture.

This developmeut in mines, mechanics, and agriculture, with only one-fortieth of our land uuder cultivation, of a State not yet out of its teens, shows the need of "hewers of wood and drawers of water." We need them, and will absorb them as the parched soil does the Octoher rains; after which, instead of valleys seared, bedrocks bared, farms desolate, the green grass springing from every nook and corner, will he an answering benediction to this priceless gift.

When our rivers, ewecping down their rugged channels, shall be checked by the hand of art; when the virgin soil of our valleys is turned with the plowshare; when our forests yield their treasures; when our hillsides, clustering with grapes that rival those of famed Escol, and yield a vintage purer and better than France or Spain; when the din of occupation resounds from every square mile of our inheritanee, we will absorb any immigratiou that may come here, *turn it into channels of trade, teach it to carry our burdens, and make it the element of our strength.*

The people who are here and who are to come, and their children, must be taught. Our public schools supply all that a common education requires; the College of California will supply the classics. The Agricultural College will teach the science and chemistry of farming. There are special callings that must be taught by special institutione.

It is the mission of the Mechanics' Institute to promote whatever is conneeted with the mechanic arts. The young inventor must be encouraged; the aspiring mechanic must have his ideas enlarged; the metallurgist must be provided with the laboratory, where practico shall accompany theory; tbe draftsman must be supplied with models and made proficient with lines and shades;—the worker must have the condensed progress of the age set before him, the laborer ueeds the refinement of intellectual exercise, and the community these exbibits of mechanical progress. All these the Institute will supply as the means contributed by a generous public will permit. From rented rooms and borrowed books, from days of adversity, it has grown, and uow owns its building with a library of fifteen thousand volumes, reading-room, chess-room, lecture hall, class of drawing, and polytechnic branch, before which are read papers on different subjects closely allied to mecbanics. If pecuniarily successful, wo intend to add a course of popular lectures, a branch of metallurgy, a class of chemistry—expanding every year as funds will permit. Since the 29th of March, 1855, this institution has steadily increased in power and usefulness. Its present flattering condition is the result of arduous labor and fidelity to the law of progress; recognizing merit free to competition—no restriction save good behavior. Encouraged by tbe past, with your support in the future, our motto shall be—

No dread of toil have we or ours;
We know our worth, we weigh our powers.
The more we work, the more we win.
Success to trade!
Success to spade!
And the corn that's coming in!
And joy to him who o'er his task
Remembers toil is nature's plan;
Who, working, thinks,
And never sinks
His independence as a man.

State Fair.

An attendant throughout the whole of the State Fair at Sacramento writes us the following: "At the Park the attendance has been large all the week. Much fine stock of all kinds has been on exhibition, and horse racing and gambling have, beyond cavil, heen more thoroughly represented than anything else.

At the Pavilion bnt little interest has been taken. There was probably not more than one-half as much on exhibition as last year. Tho steam engine placed there for the purpose of attaching to and working the machinery on exhibition, I think has not in any case been used.

For the eveuing promenade or a speech each evening, the Hall answered a good purpose; but for the purpose of exhibition a change will have to be made to induce exhibitors to attend better. It might be helped by placing everything *in the Park*, so that the little time between the races could be occupied by the public in attention to their other interests. Unless something is done, I fear that Sacramento State Fairs will soon run entirely to racing, and San Francisco will absorb all other fair interests. Observer.

Sept. 11th, 1869.

The Purity of Ice.—In addition to the fact that ice is lighter than water, there is another curious thing about it which many persons do not perhaps know—namely, its purity. A lump of ice melted will become pure distilled water. Water in freezing turns out of it all that is not water—salt, air, coloring matter, and all impurities. Frozen sea water makee fresh water ice. If you freeze a basin of indigo water, it will make ice as clear and as white as that made of pure rain water. Wheu the cold ie very sudden, theee foreign matters have no time to escape, either by rising or sinking, and are thus entangled with the ice, but do not make any part of it.

Wheat Bran.—If chemistry has rendered no higher service to common life than to analyze our daily bread, it would have placed society under perpetual obligation. It is now generally understood that in bolting ground wheat the seive takes out the best and most nutritious parts of the grain. A process of lato bas been patented in England for grinding the hran into fine powder and mixing it with the flour. A Gorman chemist has discovered a method by which bran may be bleached entirely white so as to be cooked with the flour, thus adding to its nutritive power without affecting its color.

When is a tombstone liko a rushlight? When it is set up for a late husband.

What bar is that which often opens but never shuts?—A crowbar.

Mechanical Progress.

A Notable Centenary.

Our column of "Mechanical Progress" cannot more appropriately be opened, this first week of the Mechanics' Institute Fair, than by calling attention to the fact that this year is the centenary of WATT'S STEAM ENGINE.

In 1765, James Watt, a mathematical instrument maker, conceived an idea. It was that of a separate chamber for the condensation of the steam in the old New Comen engine. This happy inspiration, this suggestion of inventive genius, which has so materially modified the world's subsequent history, this beginning so magnificent in its results, took form and realization just one hundred years ago. In 1769, after four years of struggle with mechanical difficulties, such as even the workshop apprentice of our day, with his more perfect appliances, never dreams of, Watt set in motion his first engine. A well-fitting piston and cylinder were at that time out of the question; yet the machine, clumsy as it was, served to demonstrate his point. That machine is at this day essentially the same thing as when it left the hands of its illustrious projector. For proofs of progress in mechanical execution, we need only point to the exquisite specimens of such works now on exhibition at the Pavilion.

New and Convenient Battery for Blasting Purposes.

The *American Exchange and Review*, for August, describes a little pocket battery which apparently has capabilities worthy the notice of mining engineers. It is circular, about six inches in diameter, and one inch thick; and by simply turning a small handle like that of a tape measure, a gutta percha disk within is made to revolve against oiled silk, causing sufficient friction, with ten turns, to produce a spark which will ignite a small cartridge at the end of a double wire. The journal aforesaid says this little instrument was used in firing the cannon at the Boston musical festival. It acts with perfect promptness in blasting under water.

STEEL OR IRON?—A change seems to be taking place to some extent, in the opinions of mechanics and engineers on the above question. There was a time when steel having become comparatively cheap, there was a loud urging of its use for everything,—guns, rails, boilers, bridges and ships; but this is now modified. Sir Wm. Armstrong, who, says *The Engineer*, at one time persistently uttered the cry, in a recent address, used the following words: "The conclusion at which I have long since arrived is, that although steel has much greater strength than wrought iron, it is less adapted to resist concussive strains. * * The want of uniformity continues to be another serious objection to its use." The journal alluded to above, concurs in this opinion; and thinks that the use of steel will not greatly extend beyond its present limits.

SORTING ATTACHMENT TO BLAKE'S BREAKER.—The London *Mining Journal* illustrates an addition to Blake's Breaker which has been made by Mr. Marsden, the English agent. It is a horizontal revolving circular table, which receives the crushed ore from the breaker, and passes it in front of boys who sort it for working. We quote: "The stone-breaker is fixed in the usual manner, except that when necessary it is raised a little higher than usual, and to the front of the machine a stout iron bracket, which carries the top bearing of an upright spindle, on which the picking table rotates. Rotation is communicated to the table by band and pulleys, from the same main shaft that drives the stone-breaker, the change from horizontal to vertical rotation being effected, as usual, by means of a mitre-toothed wheel and pinion. The size of the table and speed of rotation can, of course, be so arranged as to leave ample time for separating the ore from the refuse. But very little power is required to rotate the table, and the effect of the arrangement is that practically the ore supplied to the breaker is not only broken but thoroughly picked before it leaves the table.

Ventilation of Mines.

The recent frightful destruction of life at Avondale, Pa., solely attributable to the fact that a furnace was used for ventilating the mine, makes one ask why it is that a furnace is used for this purpose instead of mechanical apparatus? Is it for economical reasons? Would not the same amount of coal, if used for making steam, drive the fans necessary to gain the same end? While considering this point, we met with a paper upon the subject, which was recently read before the Institution of Mechanical Engineers, at Newcastle, by Mr. William Cochrane, and reported in *The Engineer* of August 13th. We give here some extracts:

"It is considered a fair estimate of the economic value of the average conditions in which furnaces are worked that only one-fifth of the heat due to the combustion of the coal is utilized. There are many objections, besides the small useful effect, to the use of a furnace, which cannot be overcome, and which form a constant source of cost attendant upon it, namely, the necessity of cleaning the flues and the consequent suspension of the active ventilation of the mine; the inconvenience, and in some cases the impossibility, of using a shaft highly heated, and often full of smoke, for any other purpose than as a ventilating shaft; and the serious damage done by the products of combustion to cast iron tubing, timber, pumps, or wire ropes, where winding is carried on in the upcast shaft, especially where the shaft is damp. If the conditions are unfavorable for the use of a furnace, such as shallow shafts and heavy resistances to be overcome, the furnace then is quite unable to compete with a good mechanical ventilator in economical effect. In a table compiled by Mr. J. J. Atkinson, Government Inspector for the Durham coal-field, has been shown the depth at which furnaces are estimated to be equal to ventilating machines in point of economy of fuel, assuming that the sources of loss are of the same extent in each case, that is, the loss of fuel in furnacee by cooling in the upcast, and in ventilating machines the power expended in overcoming the useless resistances, and that the ventilating machines utilized 60 per cent. of the engine power. A recent calculation by M. Guibal, of Mons, deduces the following comparisons: That if a furnace in a 12ft. shaft, 400 yards deep, circulate 53,000 cubic feet of air per minute under the total resistancee represented by 3½in. water gauge, and an average excess of upcast temperature of 108 deg. above the downcast, with a duty of 31lb. of coal per horse-power in the air estimated on the total resistances, then a mechanical ventilator, utilizing 60 per cent. of the power employed would, under the same conditions, have a duty of 11 lb. of coal per horse-power on the air, being a saving of 64 per cent. At a depth of 550 yards to circulate the same volume, the duty of the furnace being 22 lb. of coal, that of the mechanical ventilator would be 11 lb., being a saving of 50 per cent."

AUTOMATON ALCOHOLOMETER.—This is to measure spirit for taxation purpoees as it leaves the still. It is the invention of Dr. Siemens, of Berlin. The London *Artizan* describes it thus: "As the spirit leaves the still, it passes into a cylindrical vessel, and from this, through a drum—something like that of an ordinary gas-meter—into the cask which is to contain it. On its way through the apparatus it is measured, gauged and registered. First, its bulk indicated in gallons and decimal parts; secondly, the quantity of either absolute alcohol or of proof spirit which it contains. The measurement and registration of the quantity which passes over ie done directly by the rotation of the drum, each of the three divisions of which holds exactly five gallons. The indication of the strength is done by a swimmer in the cylindrical vessel into which the alcohol first enters. Thie swimmer is attached to a pointer, which, in being elevated and depressed by the lowering or raising of the swimmer, according to the varying specific gravity of the liquid, limits the reciprocating movements of a graduated tongue."

Scientific Progress.

The Earth's Shape and Laplace's Theory.

A writer in the *Scientific Opinion* says that the oblate spheroidal form of the earth, which has been adduced as proof of its original fluidity, is one of the supports of Laplace's nebular hypothesis; but that in fact the supposition of such original fluidity is not necessary in order to account for such form. He says that if, for the purpose of illustration, a spherical form be assumed for the earth,—or indeed any other form capable of rotation about a fixed axis,—it is easily shown that it must always tend to assume and maintain the form of an oblate spheroid, simply from causes at present in action, such as rain, rivers, and glaciers. The material eroded from circumpolar continents must be spread upon the bottom of the equatorial ocean. This form is that of equilibrium between the centripetal and centrifugal forces; and the condition required to bring it about upon a revolving globe, are an aqueous and an atmospheric envelope, time, and an internal source of disturbing power. He concludes that Laplace's hypothesis in no manner derives an argument for its support from the present form of the earth.

ANIMAL LIFE AT GREAT DEPTHS.—R. E. C. Stearns writes the *American Naturalist* that Dr. Carpenter and Wyville Thompson found *Buccinum undatum* at the depth of 1,300 fathoms, in dredging from H. M. ship Porcupine. This fact, and those ascertained by MacAndrew and Prof. Forbes, make it apparent that much is yet to be learned in regard to the "lowest depth at which animal life can exist."

BABINGTONITE.—This rare mineral is described by David Forbes, F. R. S., in the *Philosophical Magazine*. It is essentially a silicate of iron and lime. Its original locality is Arendal, in Norway, and it is rarely met with even there. "It is said to have been found in quartz in the Shetland Islands, and at Massachusetts on epidote; but in the latter case, Dana, in the supplement to the last edition of his *Mineralogy*, states that the angular measurements are not identical." A specimen sent Professor Forbes from Devonshire for assay, contained 20 per cent. metallic iron, and 48 per cent. silica. It occurs as an aggregate of groups of radiating crystalline fibers of blackish green color; fracture hackly; hardness 5.5; spec. gr. 3.436.

CHLORIDE OF NITROGEN.—Mr. Abel has recently discovered that the explosion of perfectly dry chloride of nitrogen in an open vessel produces comparatively slight destructive effects. A drop exploded in a watch-glass, for example, only breaks the glass into two or three fragments, while the same quantity, if wet, shatters the glass to atoms. The thin layer of water acts like the water tamping used with nitro-glycerine in a drill-hole. Chloride of nitrogen has been the subject of some researches by MM. Deville and Hautefeuille. As is well known, it is exploded by friction, by percussion, by contact with grease, and by heat, and, sometimes goes off without any obvious cause at all. Owing to the danger attending experiments with it, the exact degree of heat at which it explodes has never been ascertained, but the chemists named above have determined that it can be made to boil without exploding. As regards the force exerted by the explosion of chloride of nitrogen, the same gentlemen have ascertained that when exploded in confinement, the pressure of the gas liberated cannot be less than 3500 atmospheres.—*Mechanics' Magazine.*

SULPHURIC ACID ACTS ON PLATINUM.—The platinum alembics in which sulphuric acid is manufactured, are found to suffer a serious loss. In an apparatus yielding daily 8,800 pounds of concentrated acid, there was a daily loss of half an ounce of platinum, even when the acid was free from nitrous evaporation. New alembics suffered least on account of the superior compactness of the metal when recently hammered.

American Association for the Advancement of Science.

Prof. Wurtz of the *Gas Light Journal*, says that the Salem meeting was in every sense a success; the attendance highly gratifying, both qualitatively and quantitatively; and the proportion of the papers presented (more than 150 in all) which are of permanent value, unusually large. We find in the *Scientific American* an interesting account of the evening session of the 19th. On that occasion, Dr. J. B. Upham of Boston read a valuable paper upon the heart, and introduced to the audience Dr Groux, a native of Hamburgh, himself an educated physician, and now practicing in Brooklyn, N. Y., who, being congenitally deficient as to the sternum, or breast bone, furnished in his own person an excellent subject for divers ingenious experiments devised by Dr. Upham to illustrate the action of the heart. Dr. G. also described and explained his own case, with great clearness to the audience.

At the conclusion of this reading, Dr. Upham gave some further remarkable experiments. "The beatings of the hearts of several of the physicians and patients of the City Hospital, in Boston, were automatically transmitted by telegraph from the hospital to the hall in Salem. By means of the magnesium light these pulsations were made to manifest themselves to the eight by the vibration of a beam of light on the wall of the darkened room. A regular pulse of 60 per minute was first sent. Then was transmitted the healthy pulse of an excited person, regular, but having a rapidity of 90 per minute. But the most interesting cases were those of a patient suffering from pneumonia, whose pulsations numbered 118 per minute, and that of another afflicted with organic disease of the heart. Prof. Farmer, the well-known electrician, assisted by a skillful operator from Boston, had charge of the electrical arrangements in Salem. The Franklin Telegraph gave the free use of their lines for the experiments. It needs only to be added that these experiments are entirely new, and have their origin in Dr. Upham's studies for making the motions of Dr. Groux's heart perceptible to those in distant parts of a lecture room."

We shall, from time to time, farther notice the various papers read before the Association.

ANCIENT STONE STRUCTURES IN THE ROCKY MOUNTAINS.—The Denver *News* of Sept. 1st announces the recent discovery, by C. A. Deane, of stone structures upon the extreme summit of the snowy range in the Rocky Mountains, 3,000 feet above the timber line. We quote: "Mr. Deane and his party observed large numbers of granite rocks, many of them as large as two men could lift, in a position that could not have been the result of chance. They had evidently been placed upright in a line, conforming to the general contour of the dividing ridge, and frequently extending in an unbroken line for one or two hundred yards. Many of the stones have fallen over or are leaning, while others retain their upright position. In two places connected with this line are mounds of stone, loosely laid up, about two feet in height, and embracing a circular area of about ten feet in diameter. The stones were evidently collected on the spot, as the surface is clearer for a space of several yards around the structures. These lines and mounds of stone bear every mark of extreme antiquity, as the disintegrated granite has accumulated to a considerable depth at their base, and the rocks in the mounds are moss-grown. The feature more particularly identifying these structures with those of mound-builders elsewhere, is, that they present at intervals projections pointing to the westward."

DEATH OF PROFESSOR JUKES.—The London *Times* announces the death of Joseph B. Jukes, M. A., Professor of Geology to the Royal College of Science. He has held various positions under Government, and published several works on geology. He was a Fellow of the Royal Society.

A NEW ANÆSTHETIC.—Dr. Liebseich, of Berlin, has discovered a new anæsthetic agent,—"chloral,"—the aldehyde of trichloreted acetic acid, obtained by the action of chlorine gas upon alcohol. It is thought that it will prove in many cases superior to chloroform or ether.

Novelties on Exhibition at the Mechanics' Fair.

One of the chief features of the Exhibition is the suspension bridge, erected hy Mr. Hallidie, President of the Institute, to show his new principle of huilding such structurcs. Of this we shall speak more at length in a future number. Among the other noteworthy novelties, now for the first time on exhihition in this State, we may mention tbe

Tin and Tin Ware Show

of the San Jacinto Tin Mining Company, as indicative of a new and important branch of husiness, which must inevitably follow the development of the Company's mining property in San Bernardino county. This exhibit consists first of the ore as it comes from the mine, samples of which are shown that weigh a hundred or more pounds eacb, and mucb of which will average from 50 to 70 per cent. of pure tin. Exhihits are also made of tbe ore after it has heen crushed and concentrated, preparatory to heing subjected to tbe smeltiug process which turns out the metallic tin. Several hundred weigbt of tin is exhibited in pigs, of various sizes. Numerous boxes of tin plate are also exhihited, and some tin ware made up from the same. This is tbe first exhibit of this kind ever made in tbe United States. As at pressnt arranged by Mr. E. N. Rohinson, the display is a handsome one.

California Slate.

By the side of the tin exhibit may also be seen another new California production —roofing-slate and flagging-stone from the California Slate Company's works, about four miles this side the town Copperopolis. Tbis slate is equal to the best Eastern product, and is in various sizss, to suit the market. The mine is now ahle to supply any possihle demand which can be made upon the works for many years to come. The Company is shipping to this city some 300 or 400 cases a month. Stones for flagging and hilliard tahles are also among the products of this Company's quarry.

Improved Steam Stamp Mill.

Mr. G. A. Taylor is setting up in the machine department, an improved steam stamp mill, for crushing quartz, in which several new and very important improvements in the method of the direct application of steam to tbe stamps bave heen introduced. This mill will soon he in operation, and will be fonnd well worth the attention of quartz men. The most important improvement introduced consists in placing the cylinders upon slides, so that they may be readily moved downwards as the stamps wear away. This end has been most admirably accomplished, so that the change in position can be effected in a few moments, without any hrake in the steam connection. This last object is gained hy introducing an expansion steam joint, which admits of a change in its length of ahout ten inches.

The valve gear, connected with the same, is also all new and quite different from anything heretofore employed.

An improved stamp guide has also been introduced into this mill, which appears to he just the thing that is needed for such work. This improvement is worthy of most special notice. It can be readily applied to any mill in nse—is extremely simple, easily adjustable and almost indestructihle in its main parts. The iron of the stamp is made to run against hlocks of wood which are adjusted to the wear by set-screws; and which, when worn out, can be replaced almost instantly. We shall give a full and illustrated description of this improved quartz mill in a few days.

There are quite a number of otber important and interesting California inventions and evidences of progress now on exhihition, for the first time, which will be daily noticed in snhsequent issues.

Potter's Breech-Loading Cannon.

This appears to he a really meritorious iuvention, so far as it is possible for any instrument designed for the destruction of human life or art to be. There is in it a combination of excellencies and novelty, which we have heard of in no otber weapou of the kind. Mr. Potter has beeu the first, we believe, to apply tbe principle of the Prussian needle-gun to cannon. It is a breech-loader, and made so by an appliance exceedingly simple and effective. The charge is exploded by a needle wbich passes through tbe breech-pin and into the center of the cartridge—thus securing a perfect comhustion of the powder. The gun is sigbted, hefore the load is placed in it, by looking through the bore itself; thus affording the greatest security to the gunner from the sharpshooters of the enemy. The gun can be loaded and fired with great rapidity. By the application of the needle, which fires the charge from the center, a much smaller amount of powder can he employed to do a given amount of work, aud a proportionate decrease in weight of metal in tbe constrnction of the gun is therefore admissible. The outer portion of the pin is furnished with a packing, which is expanded with the recoil, so that no gas can escape with the discharge of the gun. A patent has heen solicited for this invention.

Potter's Improved Projectiles.

Mr. Potter also exhihits a number of improved projectiles, for which he has obtained letters patsat tbrough the Mining and Scientific Press Pateut Ageucy. These projectiles are quite uovel in their construction, baving three slightly twisted flanges projecting from tbeir rear, which serve to impart to the ball the rotary motion so essential for accuracy, which in other projectiles is accomplisbed by rifling the gun barrel. By the use of these projectiles a smooth-bore gun is made equally as effective and accurate as one that is rifled. Moreover, contrary to what one would suppose, these projectiles meet with much less resistance from the air than those ordinarily fired from rifled barrels. This is known from the fact that while the latter move in their flight with a loud hissing noise, the result of atmospberic friction, Mr. Potter's improved projectile moves with equal celerity, precision aud force, but absolutely without any noise whatever. One of the projectiles exbibited is constructed in two sections, with a chamber hetween tbe two, in which may be placed a powerful detonating powder, which will be exploded at the iustant of contact, imparting a renewed impulse, almost or quite eqnal to that originally given in the harrel of the gun itself. This projectile is intended for or agaiast forts, iron-clads, etc.

Kennedy's Improved Propeller.

Mr. John E. Kennedy exhibits, at the eastern end of the machiaery department, an improved propeller, the construction of which is designed to secure the pressure of the hlades upon the water as to prevent, to a great extent, the usual loss from slip and splashing. It is claimed that by the action of this propeller the water is so concentrated or packed hehind each hlade, as to be driven directly back in a comparatively nnhroken column. This is accomplished hy a novel formation of the blades, which have a reverse turn upon their extreme front or outer extremity. This model presents quite an innovation upon the ordinary form of propellers, and is now exhibited to the puhlic for tbe first time.

California Flax.

Ahout midway of the southern portion of the Pavilion, Mr. W. D. Perriae, exhibits some very superior samples of flax, growu upon his ranch at Half Moon Bay. A quantity of the new fiber is also shown. This is pronounced a fair sample of a field of 180 acres. No portion of the world can show a better growth. Mr. Perrine has had much experience in this hranch of culture, aad bas entered upon it with the view of utilizing hotb the seed and fiber. His first attempt to grow flax in this State was made in San Diego County, where he found the climate too dry and hot. He is decidedly pleased with the climate and soil of bis present locality. Flax needs for a vigorous growtb a cool aad moist climate.

The scarcity of cotton is turniag the attention of people in the Atlantic States more than heretofore to the culture of flax. In many places whore they bave heen raising it solely for the seed, they are now turning the fibre to good account. Immense quantities of bagging for cotton hales are now made from flax, instead of as formerly from cotton. It is estimated that not less than twenty million yards of such cloth will be made the present season in the Atlantic States, the value of which will not fall much if any short of $5,000,000.

The present is a propitious time for the introduction of flax culture, for its fiber, into California. The demand for flour and other sacks, already reachiag something like a million, annually, is rapidly increasiag. Most of tbe raw material for these sacks is now imported; we can and sbould raise every pound of this material at home. The success of Mr. Perrine, and growers in otber parts of this State and Oregon, some of whom, hy the way, sbould have heen repsented at this exhibition, has fully demonstrated the practicability of this culture. We have already a good market for the seed at tbe oil mills, now let some of our enterprising capitalists furnish the macbinery and capital necessary for working up the fiber, and we sball witness the opening up of a new business on this coast which will tell wonderfully upon our progress and prosperity.

Opening Ceremonies at the Pavilion.

[From the Mechanics' Fair Daily Press, Sept. 15.

Promptly at the hour appointed, the sound of the big holl and screech of tbe steam whistle gave signal that the work and noise of preparation must cease wbile the opening ceremonies were in progress. The same signal announced the appearance in the hall of the officers of tho Institute and Committee of Management, accompanied hy the Orator, Chaplain and invited guests, among whom were Mr. Seward and Gen. Ord. The party marched in procession, witb martial music, up the central aisle of the nave to tbe fountain, where they filed off to the right and passed around to tbe rear of tbe speaker's platform, which they ascended and occupied. The appearauce of Mr. Seward in the group was the signal for hearty applanse. After order had been restored, President Hallidio steppod forward and made a sbort speech, apologetic of the incompleteness of the work of the exhihitors, and alluded to the general and superior character which the Exhibition would assume when everything was in place. Exhihitions were made from all parts of the United States, from China, Japan, the Islands of tbe Pacific, etc. Ho alluded, in brief, to the financial condition of the Association, which was quite satisfactory. It was hoped and confidently believed that the proceeds of the present Exhihition would place the Institute well nigh out of debt. It alroady numhered 1,300 members, and was constantly increasing in numbers, strength, usefulness and in the confideuce and respect of the public. He hoped that through its influence the mechanics of San Francisco and of the Pacific Coast, would soon reach tbat poiat of social and intellectual influence, which their importance in the world's economy entitled them to. He alluded to his own position as a mecbauic, called attention to his labor-worn palms, and was proud that he was a mechauic. He desired to see more sympathy exhibited for mechanics among the young ladies of the city; appealed to the memhers of the Normal and Denman young ladiss' schools, to exercise their iuflucace in tbis direction, among their friends and brotbers. Mr. Hallidie's remarks were warmly applauded.

The pupils of the Denman School then united in a beautiful cbant, accompanied by music from the haad; after which the Rev. M. C. Briggs offered a fervent prayer appropriate to the occasion. The school cbildren then sang, with beautiful effect, the charming soag, "Away to the Woods," after which the Presidsnt introduced the orator of the occasion, Mr. Irving M. Scott, a young man who has grown up with our city—a tborough mechanic, who has worked his way up from the hench to a partnership in one of the most extensive foundries and machine shop establisbments on the Pacific Coast—the Union Foundry and Iron Works.

The address was listened to with the most marked attention by the vast concourse of ladies and gentlemen present. The earnestness and interest which was manifested dnring its delivery by so large aad intellectual an audience, furaisbes the happiest and most emphatic testimony which can he given of its merit. Mr. Scott's manner of enunciation, always good, was especially so on this occasion. He spoke with a distinctness and volume of voice wbich greatly added to the literary effect and pecnliar appropriateness of what was said. He was frequently applauded during its delivery.

A beautiful hust of the eminent scientist, Alexander von Humholdt, the work of P. Mezzara, an artist of this city, bad heen placed in the center of the speaker's platform, veiled with the national flag. When the orator reached that part of his address where allusion was made to that distinguishsd man, and to the happy circumstance that they were then assemhled on the one bundredth anniversary of bis birthday, this bust was unveiled amid great applause and sensation.

At the conclusion of the address, lond calls were made for Mr. Seward, wbo came forward to the front of the stand, but merely bowed his acknowlegments, and retired again to bis seat. The Denman School girls, accompanied hy the band, then struck up the national hymn "America," in wbich the entire audienco, rising to their feet, joined most heartily.

The ceremonies heing coneluded, the school children, who were mostly in the rear of the venerahle and distinguished ex-Secretary of State, expressed a desire to see him. Mr. Seward immediately changed his position, smiled, and shook hands with quite a number, who eagerly pressed forward to crave that privilege.

The exercises heing thus concluded, tbe crowd dispersed—some to retire to their homes, others to wander through the mazes of the Pavilion, and examine the articles on exhihition, and witness the further preparation of the same, which was resumed immediately after the conclusion of the opening ceremonies.

New Incorporations.

South Fork Canal Company.—For the purpose of running and constructing canals and ditches to convey water from the South Fork of the American river and otber sources to the vicinity of the city of Placerville and other points for irrigation, water power, mining, manufacturing and other purposes. Capital $100,000, in sbares of $100 each. Trustees—Charles Hosmer, Solomon A. Sharp, B. S. Hunt, Joseph Taylor and E. H. Evans. The principal place of business will be in Placerville.

Peoples' Gas Company.—Sept. 15th.—The object to manufacture gas and supply the residents of the State of Californaia with the same. Capital stock, $2,000,000, divided into twenty thousaud shares of $100 each. Trustees—Isaac Rowell, Alexander Gnoiu, D. O. McCarthy, Robert Kirk, and Nathaniel Page.

Continental Life Insurance Co., 302 Montgomery street, corner of Pine.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, September 18, 1869.

Financial.

Our local money market sympathizes strongly with that of New York, but is never subject to those violent and extreme spasms with which New York is so frequently afflicted by reason of its cormorant Wall Street speculators, who are just now engaged in the worthy occupation of waging financial war against the importing merchants. This class have to use large amounts of gold for customs duties, and it seems that prominent Wall Street operators have combined with a number of foreign capitalists to purchase and lock up $30,000,000 in gold, so as to compel importers to purchase from them at exorbitant rates. To procure the necessary gold, the importers have been compelled in several instances to purchase United States bonds and sell them in Europe, ordering the proceeds to New York. Remittances from this city to the extent of $1,000,000 have been forwarded to New York between the 1st and 16th of September, and will probably continue to be unusually large for some time to come. Nevertheless we note a growing ease in our market, and shall soon receive back the money paid for domestic produce to our farmers, who must now commence to lay in their fall and winter supplies.

The funds in our savings banks continue to augment, and are actively sought on real estate securities at 1@1¼ per cent. per month. Bank rates of discount for first class paper rule at 1¼@1½, according to circumstances; outside rates are from 1¾@2 per cent. per month.

Bullion is scarce, owing to the large quantities forwarded to other places and limited supplies from the mines. We quote bars at 860@870; silver bars from par to ⅜ percent. discount; currency bills on Atlantic cities, 34 per cent. premium on gold; coin sight drafts, 1¼@1¾ per cent. premium; telegraphic transfer are nominal at 2¼@2¾ per cent. premium; sterling exchange, 48¾d; commercial exchange, 49⅛d; Mexican dollars nominal at 6@7 per cent. premium; gold in New York, Sept. 16th, 136¾; legal tenders in this city, 73¼@74c.

The exports of Treasure from Sept. 1st to date bavs been as follows:

Sept. 4—Per Japan—		
To China	$516,218 04	
To Japan	24,878 00	
		$541,096 04
Sept. 1 to 9—Overland to New York		539,511 34
Sept. 14—Per Colorado—		
To England	$649,670 02	
To France	177,304 18	
To Central America	11,940 00	
To Panama	20,000 00	
		858,914 20
Sept. 10 to 17—Overland to New York		477,500 00
Total since September 1st, 1869		$2,417,021 58
Previously this year		25,999,830 42
Total since January 1st, 1869		$28,416,852 00
Corresponding period, 1868		27,613,094 36
Increase this year		$ 803,847 64

The duties paid at the Custom House in this city from September 10th to date have been as follows:

September 10	$16,837 84
September 11	30,716 08
September 13	24,409 86
September 14	41,445 41
September 15	17,748 19
September 16	26,914 58
Previously in September	304,377 65
In September to date	$462,449 59
In August	769,589 56
In July	942,814 71
In June	675,051 81
In May	595,020 24
In April	554,882 05
In March	780,447 40
In February	602,340 00
In January	532,997 97
Total since January 1st, 1869	$5,915,603 33
Corresponding period, 1868	6,186,290 50
Decrease this year	$270,687 17

F W. J. Gatewood, President of the San Diego Railroad, accompanied by his staff, and Generals W. L. Rosecrans, N. S. Hunter, T. S. Sedgwick, the Hon. S. B. Axtell, and others interested, left the city for San Diego last Wednesday, and the work will be prosecuted with vigor forthwith. Contracts have been made with Risdon & Co. for iron work of all kinds, and full supplies of stores have been purchased. The greatest difficulty anticipated on this end of the route is in the deficiency of water supplies while working on the Colorado desert; but we apprehend that obstacle is exaggerated, as water can be obtained anywhere on the desert by digging from fifteen to thirty feet, according to locality. By running the line direct from Antelope Peak to Tucsou a distance of ninety miles can be saved, and much money economized. It would also tap the richest copper mines in this section of the Union, and avoid all chances of damage from the annual overflow of the Gila, which changes its bed nearly every year, and in some places to the extent of several miles. Such great and repeated changes would expose the road to the chances of much damage. The direct route leads over a succession of high, level *mesas* of volcanic appearance, separated by inconsiderable gullies or intervals, which could be bridged at comparatively small expense. We learn that the road will be laid out on as straight a line as possible, and we know of no serious obstacle in the way. It is positively certain that one Pacific Railroad can never do the business between this coast and the Atlantic. By the time the southern road is constructed there will be more than enough to employ three such lines, and a healthy competition between them cannot but be advantageous to every interest. In winter, particularly, the southern route will be selected, as it will not be blocked or cumbered with snow; while the climate is in every respect superior, and the country through which it must pass possesses every attribute for farming, mining, and manufacturing enterprises. There are no such heights to climb, no such obstacles to surmount, as were met and overcome on the existing railroad. For hundreds of miles very little grading will be required; and along much of the route the very best of mesquite wood can be had in great abundance for ties and other timber work. One of the greatest commercial benefits which San Francisco could experience would be the building up of San Diego into a large and populous city. If there were no Philadelphia, no Boston, and no Baltimore, the city of New York would not be to-day the great place it is. It is with no ordinary gratification that we note the vigorous manner in which the San Diego and Gila River Railroad has been taken in hand, and the energy which marks the movements of those having charge of the work. In less than five years we may be rejoicing in the possession of another great trans-continental artery of trade and travel.

Shipments of Fruit from this city, overland, have been rudely checked by the Chicago Board of Health. A. Giorgiani, an extensive dealer, sent forward about $2,000 worth of grapes and pears, which arrived at Chicago in a damaged condition. Instead of permitting the consignees to separate the good from the bad, the Board of Health ordered the whole invoice to be carted seven miles outside the city limits, and destroyed. Sig. Giorgiani netted a dead loss of $3,000, including the freight, which was $1,000. The intelligence of this transaction has thrown cold water over our Fruit exports, as no one feels inclined to place himself at the mercy of the Chicago Board of Health.

City Stocks.

No large transactions of miscellaneous securities were made during the week under review. We note the sale of a few shares of California Steam Navigation Company at 63 per cent. The usual dividend of 1 per cent. was paid on the 15th inst.——The Omnibus Railroad Company disbursed its usual monthly ½ per cent. dividend on the 16th inst.——The Bank of California disbursed its customary dividend of 1 per cent. per month on the 15th. ——At the close, sales of San Francisco Gas Company were made at $85 per share.

Mining Share Market.

The mining share market has been rather apathetic since our last similar reference, the aggregate sales showing no increase over the previous week. Prices exhibit considerable fluctuation, and for the most part show a decline. Many dealers look for an improvement over present rates later this fall—at any rate, before next spring.

HALE & NORCROSS—has declined from prices ruling early in the week. For the week ending Sept. 11th, 991¾ tons of ore were mined; 319 coming from the upper mine, and 672¾ from the lower. During the same time 777¾ tons were delivered to custom mills, leaving on hand 1,898¾ tons. On the 12th inst. the northern stopes of the fifth level exhibited little or no change since the previous report, the various floors showing the same uniformity of width of vein and quality of ore. The breasts in the south raise on this level are reported to show considerable improvement in the quality of the ore, particularly to the south of the south winze. The west drift cut the vein, but the flow of water prevents exploration at present. The south body of ore on the fourth level is said to be opening very favorably, but great difficulty is experienced in extracting ore on account of the presence of water. The south drift has not yet reached the boundary of the ore.

CHOLLAR-POTOSI—sold at very uniform rates to a less extent than the previous week. During the week ending Sept. 10th 1,118¾ tons of ore were extracted, and 1,085¼ sent to reduction mills. Of the shove-named, the Blue Wing locality produced 809¾, New Tunnel, 144, and Grass Valley, 155 tons. This mine continues to look as well as heretofore reported. On Sept. 14th $27,575 in bullion was sent to the office in this city.

GOULD & CURRY—maintained rates of previous week, under small sales. For the week ending the 13th, 213 tons of ore were extracted, and 348 sent to mills. The south drift at the seventh station has been carried in 56 feet, and north drift 25 feet.

IMPERIAL—shows a smart decline. The lowest station has been opened 18 feet, and the east drift carried forward 22 feet. An assessment of $10 per share was levied on the 15th inst.——On the 14th, the OPHIR drift was 591 feet in length.——OVERMAN shows a bullion yield of $17,000 for the month of August.

AMERICAN levied an assessment of $1 50 per share on the 15th inst.——CHLORIDE CONSOLIDATED (W. P.) levied an assessment of $1 per share on the 16th inst.

A correspondent has the following:

The Yellow Jacket yields some 200 tons daily from the south mine, and 40 tons from the Yolo tunnel. They soon the mud and water will be reduced in the old north shaft to the track-floor of the 700-foot section.——There is nothing new or important to report in the condition of either the Kentuck or the Crown Point mines.——The lower tunnel of the Occidental mine cut the ledge, but has only penetrated it five or six feet, owing to the angle at which it is struck. The ore looks well and assays well, considering that it is merely the outskirts of the ledge, and not in the regular pay ore struck at all.

The White Pine *News* of the 11th says:

All our mills are running to their full capacity, and some of them have engagements that will keep them busy for several weeks. The weather is favorable, and our teamsters are making the best use of it by keeping their teams on the road from morning till night, hauling ore to the mills. Not only are there no signs of our mines giving out as the work of development progresses, but new bodies of ore are being constantly discovered, and those already opened are proved to be more extensive than at first supposed. Neither does the quality of the ore deteriorate as depth is attained, as many believed would be the case. On the contrary, the average quality of the ore now being reduced at our mills is higher than formerly, though the ore is not selected so closely as when the mills charged $50 and upward for crushing.

MECHANICS' FAIR "DAILY PRESS."—Dewey & Co., of the *Mining and Scientific Press*, have commenced the publication of a little paper called the DAILY PRESS. It will contain all items of interest and occurrences of note in connection with the Exhibition. The printing press is propelled by steam from the boilers outside the Pavilion. During the day and evening it will be kept in operation, that all may witness its working and have a copy of the PRESS fresh from the forms.—*San Francisco Daily Times.*

Weekly Shareholders' Directory, for Meetings, Assessments and Dividends.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Sept. 17, 1869.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

	Per ton.			Per ton.
12 per cent. ore	$24 00	18 per cent. ore		$41 40
13 " "	26 65	19 " "		44 65
14 " "	29 40	20 " "		48 00
15 " "	32 25	25 " "		62 50
16 " "	35 20	30 " "		75 00
17 " "	38 25			

Ores assaying above 30 per cent., $2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

These prices, corrected by W. T. Atwood, we believe will be found substantially correct, and can be realized at this date.

PLUCK VS. LUCK.—While ten men watch for chances, one man makes chances; while ten men wait for something to turn up, one turns up something; so while ten fail, one succeeds, and is called a man of luck, the favorite of fortune.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Items.—*Miner*, Sept. 4th: Gray oxide of copper of high grade is now found in the Leviathan tunnel.....We notice posters up for bids to run the tunnel of the Monitor C. M. Co. one hundred feet. It is expected in this distance the increase of ore will be sufficient for the mill....Ray is getting good looking quartz, cutting across the Mountain lode in his claim. The M. C. M. and James Barrett Cos., adjoining claims on the same lode, are well pleased with the exhibit made....Assessment rock is said to be the kind now found in the face of the Mountain No. 1 tunnel. ....The new shop and new front to the Globe tunnel are about completed. Indications in the face of the tunnel are every day more flattering.

AMADOR COUNTY.

Moore.—*Ledger*, Sept. 11th: We learn that parties from San Francisco will at once commence work on the old Moore mine, located one mile south of this place.

Lincoln.—New and complete steam hoisting works have just been put in operation at the Lincoln mine, near Sutter Creek, and are working to the entire satisfaction of the proprietors. The mine is owned by Gov. Stanford, R. C. Downs and others, is on the great mother lode, and is about one-half mile north of the Hayward mine, now owned by the Amador Co.

CALAVERAS COUNTY.

Union Shaft.—*Chronicle*, Sept. 11th: We learn that Messrs. Peters, Champion & Arnot, who have been engaged in freeing the old Union shaft of water, have at last got the upper hands, and are taking out gravel that prospects largely. In addition to the discovery of an extensive pillar of new ground, they have ascertained that a great portion of the old diggings will pay well for re-working.

Quartz.—Forty tons of fine looking rock from the claim of Hadlock & Co., has been hauled to Smith's mill, and is now being crushed. Judging from the large amount of gold visible on the plates in the battery, the yield will be good. The lead is near town, and considerable excitement is being manifested in regard to it.

MARIPOSA COUNTY.

Mariposa Quartz Mill.—*Gazette*, Sept. 15th: Steam was turned on yesterday. Extensive alterations have been made in the mill. The batteries have been fitted up for dry crushing and appliances for amalgamating as in the Ryerson process introduced. Revolving drums for further pulverizing the sand are not at present set up.

Benton Mills.—We learn that the Mariposa Co. are going to erect a 60-stamp quartz mill at Benton Mills, on the Merced. The carpenters who have been repairing the mill below town are soon to be transferred to the river.

NEVADA COUNTY.

The State of Things.—Grass Valley *Union*, Sept. 8th: Our citizens remark upon the quietness of the town, but business prospects have not been so good in three years. No idle miners are upon the streets as during the strike, but all are busy and more mines are at work than at any time since 1866. Besides the old mines, there are a number of prospecting operations going on which cause the stamps of the custom mills to be kept busy.

A Good Prospect.—Same of 10th: A. J. Cook & Co., on Greenhorn Creek, six miles from Grass Valley, have been prospecting on the claim during the summer. Two shifts have been working, and the men on one shift, during 19 days, were in the habit of picking out pieces of rock that showed free gold. The other shift paid no attention to selections, but put all the rock in the dump pile. The rock selected was pounded by hand and yielded $1,000.

A Good Clean Up.—Same of 14th: Jos. Perrin's mill was cleaned up last Saturday after a four weeks' run. The mill is run by water power and has eight stamps. The rock crushed in the four weeks made 130 loads.

Allison Ranch.—*Gazette*, 14th: The times at Allison Ranch are beginning to assume their old time briskness. The new 16-inch pump is in place and will be in operation in a day or two. The company are working one or two other ledges in the vicinity with favorable results.

Remedy for Dull Times.—*Transcript*, 8th: Coöperative enterprise. There are yet unlimited opportunities in the mines of this county. Let our people cease croaking and take advantage of the opportunities around them, and we are confident times will improve. It is idle to fold our arms and expect capitalists to come and help us. We must first demonstrate the wealth of our mines and capital will soon come, begging for a chance.

Meadow Lake.—Same of 9th: The little furnace for roasting ore, erected by Burns & Blood, to test the Burns' process, is kept at work, and the experiments are satisfactory. The proprietors charge $40 per ton for working ore, and will not take over five tons. They also work for the full proceeds, the owner of the process paying all expenses from the mine. The new roasting was started up on Monday. The rock roasted in this furnace will also be treated by the Burns' process. The miners in the vicinity are highly encouraged.

A Big Lump.—Same of 10th: About 10 days ago a nugget, weighing 10 ozs., and worth $180, was found in the claims owned by Wells & Co., at Steep Hollow, a short distance from Remington Hill in Little York township. A large number of specimens, weighing from an ounce to an ounce and a half, have recently been found.

The Little York Water Mining Co.—At the time our last was written the company was running 600 inches of water 24 hours per day, and working 21 men. They are now manufacturing 2,000 ft. of pipe, through which water will be conducted to two additional sets of claims as soon as the water season commences.

YUBA COUNTY.

Oregon Hill.—Correspondent *Appeal*, Sept. 14th: A company of Chinamen have bought Pepper's ranch and orchard for $3,000, and propose buying 3 more abandoned placer claims. There are 7 companies at work in the Yuba; one at Long Bar employs a dozen hands, all old French miners. These claims are worked by a hoisting apparatus called a mast, and the machinery is run by the water in the river. Roberts and Alberts are having iron pipe made, on the ground near their hydraulic claim. The pipe is 14 inches in diameter. Their claim has a front of 2,000 ft., and a hight in some places of 75 ft.

SISKIYOU COUNTY.

Big Ditch.—Yreka *Union*, Sept. 11th: James Quinn has 100 Chinamen engaged in cleaning out the ditch. It will conduct water to Yreka and Hawkinsville in about three weeks. The citizens of those places have contributed $800 to aid in repairing the ditch.

TRINITY COUNTY.

Douglas City Items.—*Journal*, Sept. 11th: The wing-dams along Trinity River were generally washed away by the recent rise, but nearly all will be rebuilt this season....A company of Chinese have a claim on Point Bar, above Steve Lane's, which has been paying them well this summer.

Northfork Items.—R. Currie has struck a good claim at the mouth of Eastfork, about one mile above the town of Northfork....Yohe & Leary are washing up in their claim on the bar opposite the town. Some very rich spots have been found in the same bar....Henry Fauhel, on Trinity River, between Northfork and McGillivray's, is doing extremely well.

TUOLUMNE COUNTY.

A Rich Mine.—Sonora *Democrat*, Sept. 11th: The owners of the Confidence mine cleaned up their mill this week, after a run of seven days, crushing 170 tons, which yielded 237 ounces retorted gold, worth $4,000. This being the first run made in the new mill, amalgam to the value of several hundred dollars remains in the batteries which cannot be got at in an ordinary cleaning. The Confidence have out already a large amount of ore.

The Rough Mine.—Three-fourth of this mine has been sold by Mr. Richards to practical miners. Mr. Richards retains the other fourth, and pays his share of the labor. The mill runs five stamps and is in good working order.

Arizona.

Walker's District.—Prescott *Miner*, Aug. 28th: The Box Elder ledge, Jackson & Co., is a rich thing. The ore is extremely like that from the famous Colorado "Bob-tail." The shaft is to be sunk 100 feet before testing the rock. It is now 60 feet, and the vein six feet wide. Uncle Billy Pointer is still at work upon his lode. We learn that the shaft is down 20 feet, at which depth he has a good ledge of four feet. As yet, but few sulphurets have shown themselves, and the rock is very rich in free gold.

Hassayampa District.—A. O. Noyes has been experimenting with the Paul & Wood process, and has succeeded in working Chase ore by it, to his satisfaction.

Charley Taylor, of Upper Hassayampa, has at last secured competent men to finish his water wheel. He has sunk a shaft of 20 feet on the Astor lode; at that depth the vein is three feet thick, and the rock just as rich as he cares to have it.

The placer miners of the district are working away with rockers, making small wages.

The Sterling.—A note from A. Widman, Supt., Aug. 24th, informs us that the company's mill was started on the 23d inst., and that everything worked to the satisfaction of all; also that the mine was yielding plenty of ore. The only drawback is the scarcity of water. The mill can only be run at intervals. It is thought that it will crush 13 tons every 24 hours.

Walnut Grove District.—At latest dates Mr. Lambert was arastraing ore from the Big Rebel. Several parties had commenced work in the creek.

Weaver District.—The Mexicans in the placers are said to be taking out considerable gold.

The party that purposes prospecting the country near the mouth of the Little Colorado, is ready to start as soon as the man who is to guide them to the diggings gets here from La Paz.

The Richest Yet.—Arizona, Aug. 21st: Some time since, a man named McPherson made a discovery of what bids fair to be one of the richest silver mines found on the continent. He succeeded in prying out masses of almost pure metallic silver. Being an old acquaintance of Gen. Roberts, of California, Mr. McPherson proceeded at once to report to his old friend. A. Harpending, Roberts and others, immediately secured the services of M. P. Arnold, an experienced miner, to come here and examine the mine. There being no troops at this place that could be spared to escort Messrs. Arnold and McPherson, Gov. Safford and some eight or ten of our citizens volunteered to accompany them, and on Tuesday morning started for the locality.

Idaho.

Poorman.—*Tidal Wave*, Sept. 9th: The Poorman mine, which for several months has been considered a "sick man," has blazed out again in full health. A fine vein of excellent ore revealed itself in the south drift of the 400-ft. level on Monday and revived the spirits of those in charge. The vein is three ft. wide.

Big Clean Up.—*Avalanche*, Sept. 4th: The Ida Elmore cleaned up last Monday 1,538 lbs. of amalgam, the product of a week's run of 15 stamps. Besides 200 lbs. of amalgam accumulated in the battery which when retorted will make over 50 lbs. of bullion, worth at the rate of $9 per ounce.

Miners' Meeting.—At a meeting held last Sunday by the claim owners in the district below Wagontown, the claims were laid over until the 15th of next May.

Items.—From the same: The Alison has now a double shaft 175 ft. deep. On Saturday a vein of 18 inches wide was uncovered in the north drift....The Habersbaw has an incline 20 or 40 ft. deep. At the bottom is a 3½ ft. vein....Silver Cord shaft is down 193 ft., and has a 2 ft. ledge of good ore....Empire shaft is 35 ft. deep. Ledge 1½ ft. wide....Starlight has a 40-ft. shaft, and a 2-ft. ledge....In the Red Jacket, a foot vein of very rich rock has been struck, at the depth of 80 ft. The ore resembles that of the Ida Elmore. One of the hands in sinking a post-hole, struck a deposit of rich mineral near the surface, from which $200 worth of specimens were extracted in a few minutes....In the Peck & Porter, hands are timbering up the shaft which is 90 ft. deep. The ledge looks well.

Alturas Co.—Rocky Bar correspondent of Boise City *Statesman*, Aug. 7th: The "Ne Plus Ultra" mine, at Bonaparte Hill, belonging to Craven Lee, is two feet wide, gold free, and prospects exceedingly rich. L. Lincoln, one of the owners of the Ehel mine, has a good 5 stamp mill, with engine, boiler, etc., ready to commence crushing. He has taken out some 250 tons of quartz, which will doubtless average from $35 to $50 per ton.

A private letter from Rocky Bar says the Monarch Co. have bought out the Greenhack Co.—consideration, $300,000. The Casco will make a big clean up in a few days.

The Loon Creek Diggings,—Correspondent Boise *Statesman*, Aug. 30th: There are 500 or 600 men on the creek. The claims that have been tested are confined to the space of a mile, or a mile and a half, and these give evidence of being very rich. A Boise man told me to-night that he saw $5 taken up yesterday in one pan. The gold is coarse, and slugs weighing from $1 to $3 are not uncommon. It is confined to the bedrock of the creek, and a few inches above it. Claims are held at from $3,000 to $10,000 each. The prospecting has been confined to the creek. The mountains are high and rugged.

The same writes from Oro Grande, Sept. 1st: Owing to the manner in which the claim laws of the district were made, and then taken up, by the first comers, there is no ground left for location, although plenty for sale. But in a few weeks the miners will be compelled by the laws to work their ground one day in seven, and much of it will then, I think, be open for relocation, or purchase at low rates. Very little work has been done anywhere. The claims of Varney & Co. are opened, and are running a sluice and working five men. They have thus far made about an ounce per day to the man. From a cut about 35 ft. long and six wide on the bedrock, beginning on the creek bank, they took out $236. This prospects the poorest of any part of the claim. I went into their works this forenoon, and from one pan of dirt, which I took up myself, washed out $2.50, reckoning it at $16 per ounce. It is claimed to be worth at least $18, and is beautiful coarse gold. The men told me that by picking their dirt they could often get from $5 to $15 to the pan. From all I have seen and can learn I am satisfied that when these claims are opened and worked, with the skill with which they work mines in Boise Basin, they will pay from two to four ounces per day to the hand.

The *Statesman* has seen some of the gold. It is coarse, of dark color. It was brought by Mr. J. Armstrong, who, with two others, took up 400 ft. of ground. Mr. Armstrong sold his interest for $2,500. A few days afterwards he offered $2,000 for one-half of what he sold, but it was refused. The men who now hold the claim valued it at $25,000, and think they will be able to take that amount of gold out of the claim this fall.

The *World* of the 2d says that Joe Luckett has come back. He thinks the diggings will not prove extensive, but believes some of the claims very rich. The ground is only rich in spots. Only two claims have been worked, and very little gold has been obtained outside of these two. Nearly all the claim holders try to sell, but will allow no one to prospect before a purchase is completed. Mr. Luckett will not go to Loon Creek again, he thinks.

During the week quite a number of those who went to Loon Creek from this city have returned. Some of them think pretty well of the new camp, and others think otherwise. But all seem to agree that it will not become more than a good small camp.

Montana.

Emigrant Gulch.—Virginia *Republican*, Sept. 3d: The news from Emigrant is most encouraging. In the upper district there are five or six companies operating, chief of which is Culver & Co., the gold yield paying all expenses from the time they first struck gravel. Their drain-race is down 28 feet, at which depth prospects seldom fall below ten cents to the pan, and often reach a dollar, and there is still no bedrock. The miners who have explored the ground are strong in the belief that it will prove equal to the Carihoo diggings. Six miles below Culver & Co. pay gravel is reached at a depth of 30 feet, and the prospects are flattering. Water is abundant and timber near.

From Bannack.—We learn that the mines are all being worked, notwithstanding the water is scarce, and claim owners generally are doing well. Many of the miners who rushed frantically to the new discovery on the Salmon, are rushing frantically back again, and resuming their old places.

Argenta.—Gen. Cummings reports that mining about Argenta is progressing finely, but operations are retarded owing to the scarcity of hands, many having gone to Salmon river. The Atlantic Cable lode, upon which Gen. Cummings' company has been working, is well defined, and presents a crevice of from twelve to fourteen feet in width, filled with very rich ore, and is considered the mother lode of the district. Mr. Rompf is expected to return within ten days, and a new furnace, on the reverberatory plan, will be erected, with an improvement invented by Mr. Rompf.

Bowlder Valley.—Helena *Gazette*, Sept. 2d: The miners are at a standstill for want of water. In the Bowlder ditch, which has a carrying capacity of 1,000 inches, only 150 inches are running.

Quartz in Jefferson County.—Blacker & Keeting have erected an arastra, with two stamps, near the Leviathan lode. Last week they crushed eleven tons of quartz from the Keeting lode, and made a clean up of over $1,300. Fourteen tons of quartz

was crushed at Nave'e arastra last week, taken from the Robert E. Lee, which averaged $45 to the ton.

PHILIPSBURG.—Correspondence of *New North West*, Sept. 3: The St. Louis and Montana Mining Company's mill started up on the 20th August, on 250 tone of rock. No clean up has yet beeu made. The ore will last but a few days longer, and no mining operations will probably he entered upon by that company this season. Thirty dollars per ton for crushing ores, delivered at the mill, does not meet the approbation of the miners. There is now a full supply of rich paying ore in sight for a first-class 20-stamp mill. We have seen no less than thirty tons in which pure native silver is visible in every piece, and in some instances the surface is literally covered with it. Several companies are awaiting advices from mill men now absent. Should either succeed, work will be commenced upon several ledges about the same time. Two thousand tons of fine milling ore can be delivered at any given point in this district in a month's time. A good 20-stamp custom mill in one year, run under proper management, will realize a fortune.

A letter to the above saye that at Silver Bow, in Deer Lodge county, dirt is being hauled two miles to water, and pays $20 per day to the man. There are thousands of acres of ground between Silver Bow and Divide ereeks that will pay from "China wages to $20 per day to the man. All that country is covered by two ditchee (now dry) of L. A. Bernard & Co., who have brought these ditches over the main divide, turning the head-waters of the Missouri into those of the Columbia. The same rich placers exist, and are ready to he worked when water comes, at Butte, High land, German and Frenob gulches, and other portions of the county.

Nevada.

COPE DISTRICT.

RESOURCES LIMITED.—Inland *Empire*, 10th: We yesterday met G. W. Fuller, who has just returned from Cope. He thinks that several of the ledges will pay well for working, but that the resources of the district are too limited to justify any great stampede. Most, if not all of the ledges of any value, have been taken up, which will justify the expense of working.

MINERAL HILL.—Grass Valley *Union*, 11th: A letter was received yesterday from Mr. G. Y. Dorsey, of this place, who wrote from Carlin, at which place he had just arrived from Mineral Hill, the metropolis of the Cope District. He says many persons are flocking into the country, much prospecting is being done, and some of the lodes are showing great richness—having worked as high as $1,200 and $1,500 per ton by mill process. He regards the Cope as the best mining district in the Stato of Nevada, and one from which large returns of bullion will be made in good time.

MILL PURCHASED.—Elko *Independent*, 11th: Col. Drew and Uncle John Atchinson have succeeded in purchasing a mill in San Francisco for Cope District, and Mr. Atchison is now on his way up to go to work on the foundation. The mill is of 10-stamp capacity, and of the latest and most improved pattern, with Haun pans. It is intended to have the mill in operation before the snow falls.

ESMERALDA.

DRY MOUNTAIN MINES.—S. F. *Times*, 14th: A man named Geo. F. Kerst, arrived in the city a few days ago from the Dry Mountain Mining District, near the eastern line of the State, south of Esmeralda. He reports it rich in both gold and silver, some of the ledges being from 20 to 50 feet wide.

HUMBOLDT.

UNIONVILLE.—Cor. *Independent*, Sept. 8th: "The greater part of the inhabitants of this burg are just now in a highly excitable state of mind, attributable to a recent discovery of rich mineral deposits in the East Range, south of Clark & Word's ranch. The ore is unquestionably rich."

UNCLE DAVE.—*Enterprise*, Sept. 7th: Evans' mill at Unionville will be completed in two weeks, and will run on gold ore—chiefly that from tho National mine.

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

LADY BRYAN.—*Enterprise*, 8th: The extent and richness of the ore is exceeding the most sanguine expectations. Although it is but a few weeks since the Empire State mill began work upon it, the yield, up to the end of August, is but a trifle short of $30,000.

YELLOW JACKET.—Same of 12th: The company are still at work cleaniug out their north shaft. The south shaft is yielding about the usual quantity of ore. During the year ending June 30, 1869, the receipts were $1,964,450; the disbursements some $250,000 more. Of late, affairs have much improved, and many debts have been paid up.

LADY BRYAN—This mine is looking better than ever, now taking out 70 tons per day, besides keeping the Empire State mill running and piling up ore for the Lady Bryan mill, which will start about the 20th. Some of the rock will pay at least $150 per ton. The yield for October will not he less than $50,000.

SIERRA NEVADA.—The usual amount of ore is being taken out, and the mill is kept running. They have in sight a great amount, not only of quartz, hut also of paying gravel.

OCCIDENTAL.—Ledge in lower tunnel cut and penetrated four feet. Rock pickable. Ore excellent. Prospects flattering.

OVERMAN.—Sixty tons of ore per day—averaging over $20. Ventilation being imperfect, little can he done in the 500-foot level until the winze is completed.

OPHIR.—Still drifting; now in from shaft 570 feet. A large Root blower has been received and will soon be set up.

HALE & NORCROSS—Is yielding 150 tons per day of good milling ore.

VIRGINIA CONSOLIDATED.—Shaft down 275 feet. Good progress made day and night.

CHOLLAR-POTOSI.—This mine is yielding about 180 tons of ore per day, which mills about $50. They have lately developed a body of ore, however, which will pay $80 or over.

STARTED UP.—Gold Hill *News*, 7th: The Rock Point mill, on Carson River, just below Dayton, which has been shut down for repairs during the last four or five weeks, started into full operation again yesterday.

ATHENS.—Carson *Appeal*, 10th.—A contract has been made to run 50 feet of a shaft. The work will be commenced forthwith.

WHITE PINE.

WEEKLY MINING REVIEW.—*News*, Sept. 11th: Our principal mines are getting fairly at work, and the results are seen in the increasing prosperity. The number of men employed in taking out ore is being increased from week to week, as room is made by the extension of the works under ground. Within the next two weeks a material increase will be made by the starting up of the Stanford mill. The Daytou, Tregloan's and one or two other mills will start soon after, which will still further increase the demand for laborers. All our mills are running to their full capacity, and some have engagements that will keep them busy for weeks. The weather is favorable, and teamsters are on the road from morning till night, hauling ore to the mills. Not only are there no signs of our mines giving out as the work of development progresses, but new bodies of ore are being constantly discovered.

LOOKING UP.—*Empire*, 9th: During the past month all the mines have improved in the character of the ore struck. The Big Smoky mill, 20 stamps, which took out $80,000 last month, will, it is confidently asserted, clean up $110,000 this month, owing to the increased richness of the ore. From the other mills like good reports reach us. The mills which will go into operation about the first of October will so increase our bullion shipments as to silence croakers.

WORK IN EARNEST.—Correspondent of San Francisco *Times* writes Sept. 6th: "No less than six draft furnaces for smeltiug are now going up in the Base Range; and I predict the multiplication of such all over that Range. When tho miners see that their carbonates and oxides of silver-bearing ore can be eo easily smelted, and that furnaces for the purpose can be so cheaply erected, they will make the outlay of a hundred dollars cheerfully, and produce their own bullion with their own hands. A large portion of the ore of the Base Range is of a kind requiring no particular skill in its manipulation. The ores increase in richness with increased depth. The Eclipse Consolidated shaft is 112 feet lower at the bottom than that of the Eberhardt, yet has ores equal to any in that. At 80 feet the Miser's Dream assayed $200; the croppings assayed $60. The tenacity with which the assayers stick to White Pine is an infallible index to the richuess of the mines. They, of all others, know from daily observation what these mountains contain. Tho easterly side of Main street, Treasure City, is lined with assay offices; eo is the eoutherly side of Main street, Hamilton. There are several, also, at Shermantown."

ITEMS.—*News*, 7th: Heavy body of ore in Manhattan; as many men as can work to advantage....Twenty-five thousand tons of ore on Aurora Sonth dnmp. The mill will be started about the 15th....9th: Oriflammo Tunnel Co. in Mahogany Cañon, has resumed work. Indications good.... El Dorado will soon send oro to mill. Shaft down 50 ft. Tho men take out 15 or 20 tons daily....Tom Paine improviug. Ore rich. Forty tons sent to mill in two days. ....W. F. & Co. shipped $42,000 bullion from Newark last mouth....Good quartz in Cuba Consolidated—worth, say $65 per ton hy mill....11th: A sale has been effected of a mine on Pogonip Flat to a New York eompany—something over $200,000. ....Mosheimer is shipping about eight tone of coarse bullion weekly; and ie building a large hoarding-house for workmeu. ....12th: Aurora South sends 40 tons to mill daily....Consolidated Chloride Flat, 50; 125 men employed ...Eberhardt employs 25 or 30 men, and is takiug out good ore....Pogonip and Othello has taken out splendid ore this week....*Empire*, 7th: Five tons Morning Star ore, Babylon Hill, yielded at Murphy's mill $82 per ton.... 10th: Gen. Cadwalader thinks Babylon Hill mines as good as those of Treasure Hill.

WEEKLY BULLION.—*Empire*, 12th: There was shipped from White Pine, during the past week, hullion to the amount of $63,-857.26. This is exclusive of the shipments from Newark, and also of the metal hullion shipped from Swansea, which would probably swell the amount to $75,000.

OUTSIDE DISTRICTS.—Correspondent of *Empire*, 8th: The work at Bullion Hill, Robinson District, has been pushed with energy. At 10 ft. from the surface the base metal begius to disappear, and the silver ores undergo a complete change, the sulphides and otber forms of the silver running into rich chloride, giving an assay value of from $492 to $2,000 per ton. We shall probably make our first shipment of bullion early in next month....*Empire* of 12th says of Spring Valley District: We have specimens of ore from the Red, White and Blue, that will assay more than $18,000 to the ton....Patterson District mill was to go into operation on the 13th....Steptoe mine in Kern District, has a 20-stamp mill nearly completed. Shaft 400 ft. deep; just struck water. Ore, 2,000 tons ready for mill....Peermont District,—says the *News* of 7th,—is in the hills 60 miles east of this; 100 miles by trail. Assays range from $7 to $1,700 per ton. Entire ledge shows silver; from 20 to 50 ft. thick.

The Fruits of Labor.

How many of the thousands who will visit the present Fair and he delighted with the magnificent display of machinery, manufactured goods and products of the soil, will reflect that all they see is the product of labor? The genius which invented the powerful engine, that works with such marvelous power and precision, would never have forged his ideas into the mighty parts of his machine, but for the help of labor. The fleecy, snow-white, or exquisitely tinted fabric of wool or cotton which adorn the walls of the pavilion, would not present so many forms and hues but for labor. Tho luscious fruits, the mammoth vegetables and golden grain, would not have reached their admirable excellence but for labor. Tho exquisite pictures on the walls, the sweet flowers which perfume the building with their fragrance had not been here to instruct or please us, but for labor. It is the patient, hard, poorly-paid labor of the multitude that gives form and comeliness to the creations of the mind of genius. It is labor that built the railroad across the continent, over rivers, deserts and mountains. It is labor that erected the telegraph and enabled us to feel the throbbing heart-pulsations of our friends thousands of miles away. It is labor that has made our nation tho foremost in the arts and manufactures. It is labor that bears the burden of the taxation required to sustain the credit of tho nation. Then all honor to labor. Let us encourage our home manufacturos as a token of our respect for our local laborers, and not forget that such fruits of labor as we see around us require the liberal patronage of the public to sustain their cultivation. Every laborer deserves a fair day's wages for a fair day's toil, which we deny him when we refuse to pay a fair price for the fruits of his labor.

The Pavilion.

[From the Daily Fair Press of Sept. 16.]

Notwithstanding the full and timely notice given to the public that the Fair would open promptly upon the day and hour named, great numbers of exhibitors are much behind hand, and although an almost incredible amount of work has been accomplished during the last forty-eight hours, much still remains to be done, before anything is complete. So far as the labor under the immediate direction of the mangers is concerned, all has been done, thoroughly and promptly. Spaces have been properly assigned, and exhibitors have been urged through the public press and by special notices to have them put in order and filled; but at 11 o'clock, Tuesday morning, scoree of hammers, saws, etc., had to he stopped in the midst of their work, while the opening address by Mr. Scott and other inaugurating ceremonies were in progress; and now, as we go to press, at the eve of the second day, the work of preparation is still going on.

The DAILY FAIR PRESS, however, was in position, and the orator had no sooner ceased speaking, than it was set in motion to print the address which had just been pronounced.

In many respects the Pavilion has been altered and refitted, greatly to tho advantage of the exhibitore, and for the increased pleasure and comfort of the thousands who will visit the Fair. An entire new gallery has been added, and the booths, for the salo of fancy articles which have been constructed in the upper gallery, will form quite an attractive feature. The long art gallery, at the western end of the Pavilion, has been divided into three rooms, which afford a much better opportunity for the arrangement and classification of articles. The walls of the picture gallery have been lined with tinted canvas, the subdued hue of which adds much to the effect of the many fine paintings there exhibited. The large fountain has also been refitted and much improved. The grand balcony or first gallery, above the main floor, which extends quite around the center nave, has been provided with seats, for the accomodation of visitors, who after becoming fatigued with the promenade and bustle below, can here find comparative rest and quiet. It also affords an excellent locality from whence to take a bird's-eye view, and contemplate at leisure the busy, stirring scene below.

The Decorations.

The decoration of the Pavilion this year is far superior to anything which has yet been accomplished in that line. Bunting is profusely shown in every direction. The flags of all the principal nations of the world hang suspended from the lofty arch above; while at the sides of the arch and along the front of the galleries flags are gracefully festooned, and all the State shields and escutcheous are prominently displayed at regular intervals. The intermediate spacee or panels bear the names of noted travelers, inventors and scientific men and distinguished mechanics of all nations, among which may be noticed: Washington, Goodyear, Steere, Hoe, Fitch, Arkwright, Ross, Herschel, Magellan, Watt, Hudson, Agassiz, Rittenhouse, Brunel, Kepler, Ericsson, Count Rumford, Fulton, Napier, Stevenson, Swammerdam, Field, Galvani, Beethooven, Liebig, Newton, Gordou, Franklin, Huber, Stanford, Morse, W. Caxton, Audubon, Celteni, Arago, Maria Mitchell, Michael Angelo, Harriet Hosmer, Humboldt, Rosa Bonheur, Archimedes, Torrichel, Raphael, Bernard Pallissy, Columbus, Tredgold. Guttenberg, Carl Ritter, Jacquard, Roebling, Prince Rupert, McCormick, Greenough, Lesseps, Harvey, Cartwright, Ferguson, Howe, Daguerre, Le Fevre. Davy, Shaw, Bowdich, Benjamin, Lussac, Rogers, Alston, Berry, etc., etc.

The names of the past and present Officers and Directors of the Institute are prominently displayed upon canvas upon the western end of the nave or principal end above the lower gallery.

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Traveling Agents.

Wm. H. Murray, California and Nevada.
Isaac D. Street, Oregon.

Resident Agents.

Centerville, Alameda Co., Cal.—L. G. Yates.
Oakland—W. H. Hardy.
California and Nevada—S. H. Herring.
Sacramento—A. S. Hopkins, No. 70 J street.
Carson City, Nev.—John G. Fox.
Treasure City, Nev.—J. L. Robertson.
Shermantown, Nev.—T. G. Anderson.
Helena, Montana—E. W. Carpenter.
Black Hawk, C. T.—Harper M. Orahood.
Central City, C. T.—Richards & Crane.
Georgetown, C. T.—John A. Lafferty, Postmaster.
Denver City, C. T.—Woolworth & Moffat.
Cheyenne, D. T.—Robert Beers.
Omaha, N. T.—Barkalow & Brothers.
London—George Street, 30 Cornhill, E. C.
Hedson & Menet, 41 Park Row, New York.
A. C. Knox, City Soliciting and Collecting Agent.

Our Agent, Wm. H. Murray, is now on a tour through Siskiyou, Trinity, Shasta, Tehama, Butte and Yuba counties, and will look after the interests of the Press on that route.

San Francisco:
Saturday Morning, Sept. 18, 1869.

Notices to Correspondents.

P. A. M., Portland, Oregon.—Your specimens from east of the mountains, have been sent to a reliable assayer.

M. I. P., Alamos, Sonora, Mex.—The invention inquired about, touching sugar-making on a small scale, was itemized from an Eastern exchange, which did not give names or any further particulars. Will inquire.

Hydraulic Miner, Spanish Ranch.—You will find some items with regard to lights for hydraulic mining in the night, on page 193 of Vol. XVIII, of the Mining Press (March 27th, 1869). The calcium light will do admirably, but is too troublesome and costly for general use in hydraulic mining. The apparatus costs several hundred dollars; the most important part being the oxygen gas generating contrivances, and the gas bag, which, when put together portably, occupy the space of a traveling trunk. It will throw the light many miles with the aid of a parabolic reflector, such as you always see on locomotives. Cost of maintenance for ten hours would probably be five times that of a good large argand lamp. The latter will answer your purpose, with a good reflector. Those on locomotives cost $100, and can be had of Conroy & O'Connor. Further details of calcium light can be had from John Roach, or Houseworth & Co.

Another Moon for the Earth.—A German scientist has recently created a considerable sensation by the publication of a pamphlet, in which he takes the ground that the zodiacal light proceeds from a gaseous ring surrounding the earth at a distance of only a few thousand miles from its surface. This gas, he thinks, is in a state of quiet combustion, but is now fast cooling off, and, as a consequence, will soon burst and aggregate into a globulous mass and form a second moon for the earth, inside of the orbit of our present luminary. His idea is founded on the now generally received theory that all the planets and moons have been formed in that manner. The supposition is possible. We know but little of the cause or constitution of the phenomenon known as the zodiacal light.

Giant Powder in Pipe Clay.—At Rattlesnake Cañon, Sierra County, a horizontal hole, 26 feet long, was drilled into pipe clay overlying pay gravel, by two men in three days, and 100 pounds of Giant powder were put in. It loosened the dirt for seventy-five feet on each side. The entire cost of the blast was $147.

Issuance of a United States Mining Title.

The Enreka mine, belonging to the Watt Brothers and others at Grass Valley, has, according to a telegram received by W. Neely Johnson, Register of the Sacramento Land Office, finally got through the woods on the U. S. mining patent question. We hope that the necessary precedents have now been made for a further practical operation of the law of 1866, such as is demanded by the management of almost every good mining property in the country—and without such unsconscionable delay, or any uncalled for expense. It is true that difficulties in regard to double and triple mining title in this country, have rendered the granting of a U. S. patent necessarily cautious, and slow. The road must now be smoothed, and the expense brought to a minimum. In this the U. S. Surveyor General of California has it in his power to do the country a service.

Van Nostrand's Engineering Magazine.

Another heavy freight train of solid eclectized engineering matter is the September number, a few of the principal articles of which are on—

The Fairlee Steam Carriage *(Mechanics' Magazine);* Accumulated Hydraulic Power; *(Engineer);* Explosions of Nitro-Glycerine *(Engineer);* London Street Railways (Inventors' Institute Proceedings); Test of Agricultural Steam Engines *(Engineering);* Iron Blast Furnaces at Middleborough *(Mining Journal);* Tube Setting *(Practical Mechanics' Journal);* The Measurement of Hills *(Building News);* Dried Wood for Blast Fuel *(Oestreichische Zeitschrift);* Railway Disasters (N. Y. *Times);* Beton Building *(Canadian Builder.)*

Engineering, in its several branches, has assumed in this country something of the definiteness of profession belonging to law or medicine; the rapid development of our industries recently having afforded occasion for the pursuit of specialties by respectable numbers of practical and competent men. Under such a state of things we will make yet more decided progress in our peculiar national field of talent. To engineers, and "take-holders" generally, Van Nostrand's *Magazine* is indispensable. It contains more engineering information than any other publication of the kind in the world. We confess to a feeling of curiosity as to whether the United States, at the present time, possesses a professional engineering constituency compact enough to sustain permanently so thorough an agency of intelligence; but the impression is on our mind that we have it.

Rectangular and Topographical Ranch Boundaries.—Speaking of the U. S. surveys and subdivisions now going forward in the mountain counties of Tuolumne, Calaveras and Amador, on the rectangular basis of the government of course, the Stockton *Independent* disapproves of all but natural boundaries; forgetting that marks of latitude and longitude on lands are exceedingly handy for many purposes, and that natural boundaries can and will be adopted nevertheless, in subsequent surveys made for land purchasers. The Land Office should make provision for segregation of mountainous sections according to topography.

To See the Eclipse in Alaska.—Davidson and Throckmorton, who went to Chilkat River, Alaska, on the U. S. Coast Survey account, to observe the sun's eclipse, are back, and report a hard journey—eleven days of exposure in open boats, in getting to a country where no white man had ever been before. What trouble people are taking now-a-days, for an opportunity to stare the sun in the face.

The work of grading is about finished on the Virginia and Truckee Railroad, and the laying of the rails will soon be commenced.

Humboldt.

The Humboldt centenary in San Francisco, has passed off rather tamely, in all but the concert, which was, of course, good, as Chris. Andres' band and the Sangerbund combined, could not do otherwise than admirably. The address was very common-place—indeed, it seems that about as little of the soul of Humboldt entered into or inspired this three days' festival as could possibly be. Humboldt was a genial, most unpretending worker in the natural sciences, with peculiar ideas and fancies whose foundations were laid deep in his soul, an enthusiast in the application of those principles wherehy individual rocks and minerals, animals and plants, are grouped into species and classes; a passionate lover of landscape; one who found true delight in recognizing the beauties of exact truths and reasonings such as we find in geometry, especially in view of their applications to calculations of results of moment. All he did or knew of natural science, was beyond technicalities, and in the thing itself, on some train of generalization which agreed with the moving springs in his character. Humboldt's is a great and beautiful character, one that will stand in history much like Plato's.

Mezzara's bust on exhibition at the Mechanics' Fair, makes him look an out and out German in expression.

The English Patent Laws.

Frequent allusion has been made to the movement now in progress in England to repeal the patent laws. The *Scientific Review* gives the proceedings of a meeting of workingmen held in London on July 24th, to consider the desirability of such repeal. We have not space for the somewhat excited discussion, in which Sir Roundell Palmer and Mr. Macfie, members of Parliament, took part; but we give the resolutions which were passed, which show the general feeling on the subject. The following is the first of these:

"That the meeting having heard the statements for and against protection for inventions by the existing patent laws, is of opinion that protection is absolutely necessary as a right, by which inventors may be secured a true legitimate right in their inventions."

This was carried by an immense majority, amid loud cheers, only two hands—those of Mr. Macfie, M. P., and Mr. Clarke—being held up against it.

The following resolution was then carried by the same majority, amid tremendous cheering:

"That an amended patent law which would give efficient protection to inventors at a low cost would be of the greatest value to this country, and enable it to maintain its supremacy in the arts."

Molasses Transportation in Bulk.—The brig Novelty has just completed her second voyage from the West Indies to Boston, loaded with molasses in hulk. It is stated that the saving in this second voyage, with a cargo of 87,000 gallons, was about $5,000 over what it would have cost, if it had been brought in packages in the usual way. The figures are large; and if correct, must give the shipper in bulk such an advantage as must work a complete revolution in the business, and must result in a material reduction of one of the prime necessities of life. The further application of this mode of shipment to other liquids, must follow as a matter of necessity.

New Books.—We have received from A. Roman & Co., "The Ruthven Hydraulic Propeller vs. the Screw and Paddle," "Betou-Coignet," by L. F. Beckwith, and "Asphalt and Bitumeu-Macadamized streets," by Arthur Beckwith, which will be noticed hereafter.

The Philadelphia *Gazette* talks of employing Chinese labor in the Lackawana and Wyoming coal mines, by way of lecture to the coal strikers.

Matallurgical Treatment of Refractory Ores.

Many of the Humboldt, Nevada, ores, such as Fall's, on the Southern Ravine, assay $300 to $500 per ton; but being refractory to a large extent, are assorted into two kinds, for milling on the spot, and for shipment to Swansea or Freiberg. Sage brush furnishes fuel for Humboldt steam engines. At San Francisco and at Central City, Col., matte smelting for European extraction, is practiced profitably. This might often be done on the ground, to the advantage of mine owners. We have metallurgical skill enough, of the practical and experienced sort, in this country, now seeking employment, to save us the necessity for shipment abroad, at such loss of time, interest on money, and cost of freight. Our competent metallurgists will not fail to discover, in good enough season, the favorable opportunities where local works for limited purposes may be made a substantial success. The field of "working ores cheaply," in other words, of getting out more by the aid of practical science and skill, is open, large, and free in this country, and will not remain neglected. Of so much miners may rest assured.

Mineral Resources of Japan.—"DeOil," a Yokohama correspondent of the Sacramento *Union*, writes: "It is said that there are very rich gold mines in the immediate vicinity of Nugata, the port of the west coast of Niphon, which has been declared open to foreign trade and commerce, but as yet little noticed by foreigners. Certain it is that petroleum is very plentiful over there. There is no doubt that these islands contain as good a quantity of hard coal as any in the world, although the only kind mined is surface or soft clayey soil of rather a poor quality. They have never worked a coal mine as we do in America, or as it is done in England. The future will see all these developments made; it may be very speedily, for the wisdom and energy of the foreigner who is here now, with all his might and determination, must prevail against the fickle cunning and pusilanimous doctrine of Japanese rulers.

The European Wheat Crop.—There can be no doubt, from late accounts from Europe, but that the present wheat crop there will be behind the average of late years. According to the London *Times*, there will be a large demand upon California wheat to supply the deficiency. This view is furthermore confirmed by the range of prices for the last four months. Since April there has been a pretty steady advance in prices, which have gone up from 9s. 1d. to 11s. 3d.; the last being the quotations of August 19th. As California depends mainly upon Liverpool for her market, these facts would seem to insure a pretty safe and full market for the large crop which is now coming in here.

Combined Carpenters' Tool.—J. Nestor has on exhibition at the Fair a very useful article for carpenters' use, especially in clapboarding, combining a finid level, rule, weather-board block, marking knife, and gauge, all in convenient size for handling and work.

Pharmaceutical Association.—The respectable druggists and physicians of San Francisco have organized into a Society, which will make regulations to prevent adulteration of drugs by quacks.

Another great day is laid ont, some time in October, for the laying of the corner stone of the State University at Berkeley, at which the Masons will assist.

The *The State Fair Gazette* was published daily during the Arigricultural Fair at Sacramento, by H. S. Crocker & Co.

Labor is the grand distinction between civilization and barbarism. Savages never labor.

Inventions and Patents.

New Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS.]

Copies of U. S. Patent Claims furnished immediately at small cost. Full copies of American or Foreign Patents can be obtained by telegraph or mail through this office at favorable rates.

FOR THE WEEK ENDING SEPTEMBER 7th.

OVERSHOE.—Addison G. Waterhouse, San Francisco, Cal.

STEAM GENERATOR.—James Stuart, San Francisco, Cal.

PUMPING BY MOTION OF OARS.—Robert R. & E. Clifford Spedden, Astoria, Oregon.

SPOKE TENONING MACHINE.—Frederick H. Brinkkotter, Callahan's Ranch, Cal.

WHEELS FOR VEHICLES.—Timothy R. Smith, San Francisco, Cal.

AUTOMATIC ASSAYING APPARATUS.—Josiah S. Phillips, San Francisco, Cal.

MAIL BAG.—Zara T. Sweet, Davisville, Cal.

SELF-INDICATING LUBRICATOR.—Nicholas Siebert, Novada, Cal.

ISSUED SEPTEMBER 14th.

IMPROVED SEWING MACHINE NEEDLE.—Mrs. A. H. Supplee, San Francisco, Cal.

SHAFT ATTACHMENT FOR CARRIAGES.—Thomas C. Walter, San Francisco, Cal.

IMPROVED TOOTHWASH.—Pierre Ringpeyron, San Francisco, Cal.

PORTABLE FENCE.—Charles E. Johnson, San Francisco, Cal.

REVERSIBLE DOOR BUTT.—Jefferson Kindleberger and William A. Arnold, San Francisco, Cal., assignor to Inventors' Association of San Francisco, Cal.

SELF-REGULATING LUBRICATOR.—Nicholas Siebert, Nevada, Cal.

CIRCULAR SAWMILL.—David Evans, Eureka, Cal.

IMPROVED VELOCIPEDE.—N. Laudry, San Francisco, Cal.

Mystery in the Tickets.

In the simplest manner, by the aid of Mr. Geo. F. Pardy's device, the Directors of the Fair have declared, and effectually made, the season tickets this year non-transferable. Many have deemed the report concerning the use of such an invention as unfounded, but they can satisfy themselves, if they choose, by trying the experiment of swindling the doorkeepers. Without any more ado than by three or four stamps on your card, the clerk puts down your sex, complexion, approximate age and height, and describes your beard, moustache and whiskers precisely. The ladies are not so closely looked after. Certainly it will not do any longer to attempt to use "one ticket for a whole boarding-house." The stamped season ticket is quite popular as a puzzle, and is not found fault with by honest people. Last year it is estimated that from $5,000 to $10,000 was short, owing to dishonest transfers. Wherever now the personal characteristics are found to disagree with the stamps on the tickets, the latter is confiscated, but the holder is usually supplied with a new ticket answering to his person. This new ticket device is to be patented.

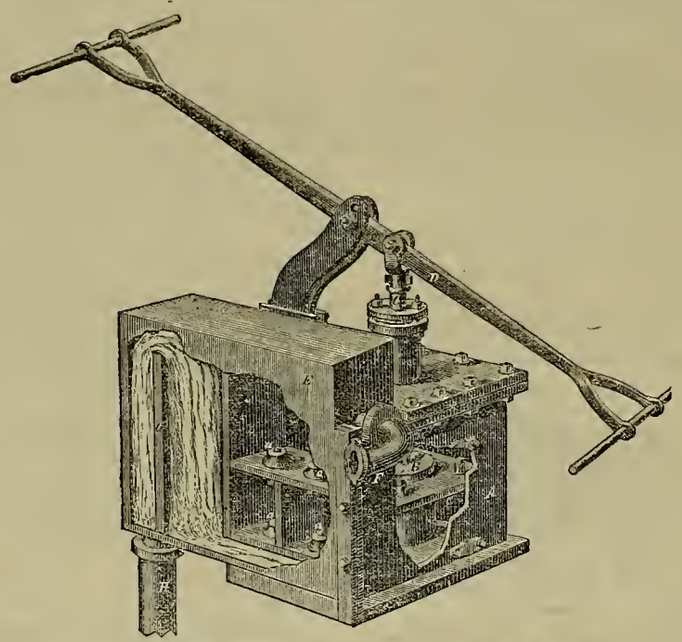
LUMBERING DULL, ETC.—At Puget Sound and other coast lumbering places a great number of logging camps have closed out, and the mills are running on half time. At Truckee, the supply point for Nevada, out of 13 mills only two or three are kept running; but this extraordinary falling off is because the railroad's demand has been supplied. No lumbering, argues no building, no fencing, no venturing.

A VEST POCKET ENGINE.—Chas. O. Farciot, of No. 15 Fremont street, exhibits a perfect steam engine on the FAIR PRESS counter, which stands on the space of a 25-cent piece. See how nicely and perfectly the little marvel runs.

Clark's Detached, Double-Acting Lift and Force Plunger Pump.

The illustration, which we give to-day, represents an improved pump, the invention of Mr. W. H. T. Clark, of this city, who is an old and experienced inventor, and who has made a number of other valuable improvements in the different branches of mechanics. The present invention combines some novel features, which, it is claimed, give the pump superiority over others of its class.

A is the case within which the piston works, and it may be either square or round, as necessity or convenience may dictate. The piston *B* is in the form of a cylinder, and is turned perfectly smooth, so that the packing, which is fastened around the opening in the diaphragm through which the piston works (shown in the center of the case), shall fit it and make it water-tight, with no danger of cutting the cylinder or piston by the introduction of sand or other foreign substances; for, in making a stroke, the tendency of any such substances would be away from the packing, instead of towards it, as in other pumps. The piston may be moved by the double lever *D* or other device.



CLARK'S DETACHED, DOUBLE-ACTING LIFT AND FORCE PLUNGER PUMP.

The valve chamber *E* contains the valves *a a a*, the two lower ones of which are induction valves, and are situated one in each of the two lower chambers, while upper or eduction valves open into the upper or air chamber, from which the water is conveyed away by the egress pipe *F*. The valves do not occupy all the space within the case *E*; there being a large space to the left, which also extends beneath the valve chambers, as shown. This space is divided off by a partition *G*, so that as the water is received from the feed pipe *H*, it is caused to pass over the top of the partition *G* into the vacuum chamber, and thence beneath the valve chambers. This arrangement gives the sand or foreign substances which may be in the water an opportunity to settle before reaching the valves, which are still further protected by placing them on raised seats, which give little chance for anything to lodge. Guiding wings are attached to the valves, so as to insure their motion in a direct line. As the space between the partition and the valves is always full of water, the valves will always be submerged, and there can be no trouble from leakage. The inventor is confident that the pump will draw water freely thirty feet, and will force it 400 feet high or more, if required.

The patent is dated May 18, 1869, and is one of several obtained through the MINING AND SCIENTIFIC PRESS United States and Foreign Patent Agency.

One of these pumps is on exhibition at the Mechanics' Fair, where it can be examined, and will be explained by the inventor either at that place or at his place of business, No. 31 Third street, in this city, where orders may be left or further information gained.

The pump on exhibition is ornamented with silver plating. Visitors who test its working express themselves astonished at the amount of water thrown for the power exerted—a simple stroke causing the flow of a bucketfull of water.

AN IMPORTANT INVENTION.—We mentioned in a late issue, that A. B. Bowers, C. E., of Petaluma, had taken steps to secure, through our agency, his right to a new invention. A few days since, we accepted his invitation to witness the operation of a working model constructed for the purpose of showing and testing the principle upon which the machine acts. We purpose publishing an engraving and full description at some future time, and therefore content ourselves at present with saying that it is a Steam Excavating and Embanking Machine, designed for the reclamation of our swamp and overflowed lands. It cuts a broad, smooth, deep ditch, depositing the pulverized earth in a triangular embankment, the base of which is a short distance from the side of the ditch; or it dumps it into a car, if desirable, to remove the dirt to a distance. It is claimed by the inventor to be capable of doing the work of more than five hundred men, and at much lower rates than it can be done by the Chinamen who now monopolize this kind of labor. Engineers who have seen the model in operation, have expressed the opinion that these estimates of the working capacity of the machine might be doubled with entire safety.

CHIEF ENGINEER.—Mr. John L. Constable, the well known mechanical engineer, has been appointed to fill this office. Mr. Constable is not only a first-class machinist, but an inventor of practical merit, and he has long been identified with precisely the kind of machinery that he here has to do with.

ANNA E. DICKINSON, one of the very noblest and ablest women of the times, departed for the East on Monday, with the earnest good wishes of a host of new-made friends on the Pacific shores. She numbers her friends among the rich and poor.

State Agricultural Fair Premiums.

These are announced in the Sacramento papers, summing up in cash, to the sum of $30,000. J. S. Curtis, of Yolo, the introducer of peanuts into California, was awarded a diploma, and a $2 premium. The cultivation of peanuts is now quite a business on the Yolo banks, having superseded importation altogether, and retained at least $50,000 a year of our gold in circulation here. The Sacramento hop raisers, Clark, Hanie and Merkeley, obtained special recognition. Mathew Cook received a premium for his blasting wedge, which will be visible, probably, also at the Mechanics Fair in San Francisco; W. B. Ready's three-gang plows; Lansen & Schafer's wine coopering, Mrs. E. F. Aiken's raisins, and C. W. Hoit's figs, were particularly approved; besides which, there is a long list of names meritorious, for apples, pears, figs, potatoes, squashes, cabbages, grain, and stock, both slow and fast, etc.

Gold and Silver Medals.

A gold medal, known as the "Institute Medal," valued at $200, will be awarded to that invention, industrial product, or manufacture, which, in the opinion of the judges, may be thought of the greatest benefit and value to the people of Californiia.

There will also be a gold medal awarded the most valuable display of California products or manufactures, in each of the twenty-one classes, into some one of which everything introduced into the Pavilion is assigned—making 21 in all of the smaller gold medals.

There will also be awarded, as *special premiums*, sixty-three silver medals, which will be apportioned to the adjudged value of the several classes, and articles entered in competition for premiums.

THE COCOS ISLAND TREASURE SEEKERS.—The Panama papers report what is hoped will be the final return to that part of the Cocos Island treasure seekers. This enterprise was first set on foot in this city, some three years ago, since which time about $28,000 has been thrown away upon the foolish enterprise. Hunting for buried treasure, when so much demand exists for labor in really useful and profitable directions, is about the worst use to which money and time can be put.

SMALL MILLS.—Mr. A. B. Paul says: A complete mill to work a few tons per day; that will cost but little, weigh but little, and get more metal out at less expense. We must get over our high-horse ideas of big mills, and no dividends—work less rock and work it better. My motto for the future (and I have had, as you know, experience in large mills), is, small mills and large mines, instead of big mills and small mines, and too often no mines at all. Small institutions worked by miners on coöperative system will build up a country and reward the industrious, when waiting for capital won't pay, and going into large joint-stock institutions will pay less.

EXCURSION FARES.—Half price, or the fare one way only, is charged by all the steamboat, railroad, and stage companies at present, from points in the interior, to San Francisco and back. The "excursion ticket" is a shrewd invention of the carriers themselves, who find it quits as profitable,—in changing retail into wholesale business,—as it is advantageous to the public, on occasions of general migration or congregation.

INTERNATIONAL INDUSTRIAL EXHIBITION AT BUFFALO.—The Canadians, preparatory to annexing the United States, are cultivating industrial and commercial relations to pave the way, by the International Industrial Fair, which is to open shortly, in October,—before our Mechanics' Fair closes. Horace Greeley will deliver the opening address.

San Francisco:

Saturday Morning, Sept. 18, 1869.

Notices to Correspondents.

P. A. M., Portland, Oregon.—Your specimens from east of the monntains, have heen sent to a reliable assayer.

M. I. P., Alamoe, Sonora, Mex.—The invention inquired ahout, touching sugar-making on a small scale, was itemized from an Eastern exchango, which did not give names or any further particulars. Will inquire.

Hydraulic Miner, Spanish Ranch.—Yon will find some items with regard to lights for hydraulic mining in the night, on page 193 of Vol. XVIII, of the Mining Press (March 27th, 1869). The calcium light will do admirably, hut is too troublesome and costly for general use in hydraulic mining. The apparatns costs several hundred dollars; the most important part heing the oxygen gas generating contrivances, and the gas hag, which, when put together portahly, occupy the space of a traveling trunk. It will throw the light many miles with the aid of a parabolic reflector, such as yon always see on locomotives. Cost of maintenance for ten hours would prohahly be five times that of a good large argand lamp. Tho latter will answer your purpose, with a good reflector. Those on locomotives cost $100, and can he had of Conroy & O'Connor. Further details of calcium light can be had from John Roach, or Houseworth & Co.

Another Moon for the Earth.—A German scientist has recently created a considerahle sensation by the puhlication of a pamphlet, in which he takes the ground that the zodiacal light proceeds from a gaseous riug surrounding the earth at a distance of only a few thousand miles from its surface. This gas, he thinks, is in a state of quiet comhustion, hut is now fast cooling off, aud, as a consequence, will soon hurst and aggregate into a globulous mass and form a secoud moon for the earth, inside of the orhit of our presont luminary. His idea is founded on the now generally rceeived theory that all the planets and moons have heen formed in that manner. The supposition is possihle. We know but little of the cause or constitution of the phenomenon knowu as the zodiacal light.

Giant Powder in Pipe Clay.—At Rattlesnake Cañon, Sierra County, a horizontal hole, 26 feet long, was drilled into pipe clay overlying pay gravel, hy two men in three days, and 100 pounds of Giant powder were put in. It loosened the dirt for seventy-five feet on each side. The entire cost of the hlast was $147.

Issuance of a United States Mining Title.

The Eureka mine, helonging to the Watt Brothers and others at Grass Valley, has, according to a telegram received hy W. Neely Johnson, Register of the Sacramento Land Office, finally got through the woods on the U. S. mining patent qnestion. We hope that the necessary precedents have now heen made for a further practical operation of the law of 1866, such as is demanded hy the management of almost every good mining property in the conntry—and without such unsconscionahle delay, or any uncalled for expense. It is true that difficulties in regard to douhle and triple mining title in this country, have rendered the granting of a U. S. patent necessarily cautious, and slow. The road must now he smoothed, and the expensc hrought to a minimum. In this the U. S. Surveyor General of California has it in his power to do the country a service.

Van Nostrand's Engineering Magazine.

Auother heavy freight train of solid eclectized engineering matter is the September nnmher, a few of the principal articles of which are on—

The Fairlee Steam Carriage *(Mechanics' Magazine);* Accumulated Hydraulic Power; *(Engineer);* Explosions of Nitro-Glycerine *(Engineer);* London Street Railways (Inventors' Institute Proccedings); Test of Agricnltnral Steam Engines *(Engineering);* Iron Blast Furnaccs at Middlehorough *(Mining Journal);* Tuhe Setting *(Practical Mechanics' Journal);* The Measurement of Hills *(Building News);* Dried Wood for Blast Fuel *(Oestreichische Zeitschrift);* Railway Disasters (N. Y. *Times);* Beton Building *(Canadian Builder.)*

Engineering, in its several hranches, has assumed in this country something of the definiteness of profession helonging to law or medicine; the rapid development of our indnstries recently having afforded occasion for the pursuit of specialties hy respectahle numbers of practical and competent men. Under such a state of things we will make yet more decided progress in onr peculiar national field of talent. To engineers, and "take-holders" generally, Van Nostrand's *Magazine* is indispensahle. It contains more engineering information than any other puhlication of the kind in the world. We confess to a feeling of cnriosity as to whether the United States, at the present time, possesses a professional engineering constituency compact enough to sustain permanently so thorough an agency of intelligence; hnt the impression is on our mind that we have it.

Rectangular and Topographical Ranch Boundaries.—Speaking of the U. S. surveys and suhdivisions now going forward in the mountain conties of Tuolumne, Calaveras and Amador, on the rectangular basis of the government of course, the Stockton *Independent* disapproves of all hut natural boundaries; forgetting that marks of latitude and longitude on lands are exceedingly handy for many purposes, and that natural bouudaries can and will be adopted nevertheless, in suhsequent surveys mado for land purchasers. The Land Office should mako provision for segregation of mountainous sections according to topography.

To See the Eclipse in Alaska.—Davidson and Throckmorton, who went to Chilkat River, Alaska, on the U. S. Coast Survey account, to ohserve the sun's eclipse, are hack, and report a hard jonrney—eleven days of exposure in open boats, in getting to a country where no white man had ever heen before. What trouhle people are taking now-a-days, for an opportunity to stare the sun in the face.

The work of grading is about finished on the Virginia and Truckee Railroad, and the laying of the rails will soon be commenced.

Humboldt.

The Hnmholdt centenary in San Francisco, has passed off rather tamely, in all hut the concert, which was, of course, good, as Chris. Andres' hand and the Sangerhnnd combined, could not do otherwise than admirably. The address was very common-place—indeed, it seems that about as little of the soul of Humboldt entered into or inspired this three days' festival as could possibly he. Humholdt was a genial, most unpretending worker in the natural sciences, with peculiar ideas and fancies whose foundations were laid deep in his sonl, an enthusiast in the application of those principles wherehy individual rocks and minerals, animals and plants, are grouped into species and classes; a passionate lover of landscape; one who found trne delight in recognizing the beauties of exact truths and reasonings such as we find in geometry, especially in view of their applications to calculations of results of moment. All he did or knew of natural science, was heyond technicalities, and in the thing itself, on some train of generalization which agreed with the moving springs in his character. Humholdt's is a great and heautiful character, one that will stand in history much like Plato's.

Mezzara's hust on exhihition at the Mechanics' Fair, makes him look an out and out German in expression.

The English Patent Laws.

Frequent allusion has heen made to the movement now in progress in England to repeal the patent laws. The *Scientific Review* gives the proceedings of a meeting of workingmeu held in London on July 24th, to consider the desirability of such repeal. We have not space for the somewhat excited discussiou, in which Sir Roundell Palmor and Mr. Macfie, members of Parliament, took part; hut we give the resolutions which were passed, which show the general feeling on the suhject. The following is the first of these :

"That the meeting having heard the statements for and against protection for inventions by the existing patent laws, is of opinion that protection is absolutely nccessary as a right, by which inv. ntors may he secured a true legitimate right in their inventions."

This was carried by an immense majority, amid loud cheers, only two hands—those of Mr. Macfie, M. P., and Mr. Clarke—heing held np against it.

The following resolution was then carried hy the same majority, amid tromendous cheering :

"That an amended patent law which would give efficient protection to inventors at a low cost would be of the greatest value to this country, and enahle it to maintain its snpremacy in the arts."

Molasses Transportation in Bulk.—The hrig Novelty has just completed her eecond voyage from the West Indies to Boston, loaded with molasses in hulk. It is stated that the saving in this second voyage, with a cargo of 87,000 gallons, was ahout $5,000 over what it would have cost, if it had heen hrought in packages in the usual way. The figures are large; and if correct, must give the shipper in hulk such an advantage as mnst work a complete revolution in the husiness, and must result in a material reduction of one of the prime necessities of life. The further application of this mode of shipment to other liquids, must follow as a matter of ncessity.

New Books.—We have received from A. Roman & Co., "The Ruthven Hydraulic Propeller vs. the Screw and Paddle," "Beton-Coignet," by L. F. Beckwith, and "Asphalt and Bitumen-Macadamized streets," by Arthur Beckwith, which will he noticed hereafter.

The Philadelphia *Gazette* talks of employing Chinese labor in the Lackawana and Wyoming coal mines, hy way of lecture to the coal strikers.

Matallurgical Treatment of Refractory Ores.

Many of the Humholdt, Nevada, ores, snch as Fall's, on the Southern Raviue, assay $300 to $500 per ton; but heing refractory to a large extent, are assorted into two kinds, for milling on the spot, and for shipment to Swansea or Freiherg. Sage brush furnishes fuel for Humboldt steam engines. At San Francisco and at Central City, Col., matte smelting for European extraction, is practiced profitahly. This might often be done on the ground, to the advantage of mine owners. We have metallnrgical skill enough, of the practical and experienced sort, in this country, now seeking employment, to save us the necessity for shipment ahroad, at such loss of time, interest on money, and cost of freight. Our competent metallurgists will not fail to discover, in good enongh season, the favorahle opportunities where local works for limited purposes may he made a substantial success. The field of "working ores cheaply," in other words, of getting out more hy the aid of practical science and skill, is open, large, and free in this country, and will not remain neglected. Of so much miners may rest assured.

Mineral Resources of Japan.—"DeOil," a Yokohama correspondent of the Sacramento *Union*, writes: "It is said that there are very rich gold mines in the immediate vicinity of Nugata, the port of the west coast of Niphon, which has heen declared open to foreign trade and commerce, hut as yet little noticed hy foreigners. Certain it is that petrolcum is very plentiful over there. There is no douht that these islands contain as good a quantity of hard coal as any in the world, although the only kind mined is surface or soft clayey soil of rather a poor quality. They have never worked a coal mine as we do in America, or as it is done in England. The futuro will see all these developments made; it may be very speedily, for the wisdom and energy of the foreigner who is here now, with all his might and determination, must prevail against the fickle cunning and pusilanimous doctriue of Japanese rulers.

The European Wheat Crop.—There can he no doubt, from late accouuts from Europe, but that the present wheat crop there will he hehind the average of late years. According to the London *Times*, there will he a large demand upon California wheat to supply the deficiency. This view is furthermore confirmed by the range of prices for the last four months. Since April there has been a pretty steady advance in prices, which have gone up from 9s. 1d. to 11s. 3d.; the last heing the quotations of August 19th. As California depends mainly upon Liverpool for her market, these facts would seem to insure a pretty safe and full market for the large crop which is now coming in here.

Combined Carpenters' Tool.—J. Nestor has on exhibition at the Fair a very useful article for carpenters' use, especially in clapboarding, combining a fluid level, rule, weather-hoard block, marking knife, and gauge, all in convenient size for handling and work.

Pharmaceutical Association.—The respectahle druggists and physicians of San Francisco have organized into a Society, which will make regulations to prevent adulteration of drugs by quacks.

Another great day is laid out, somo time in October, for the laying of the corner stone of the State University at Berkeley, at which the Masons will assist.

The *The State Fair Gazette* was puhlished daily during the Arigricultural Fair at Sacramento, hy H. S. Crocker & Co.

Labor is the grand distinction between civilization and harharism. Savages never labor.

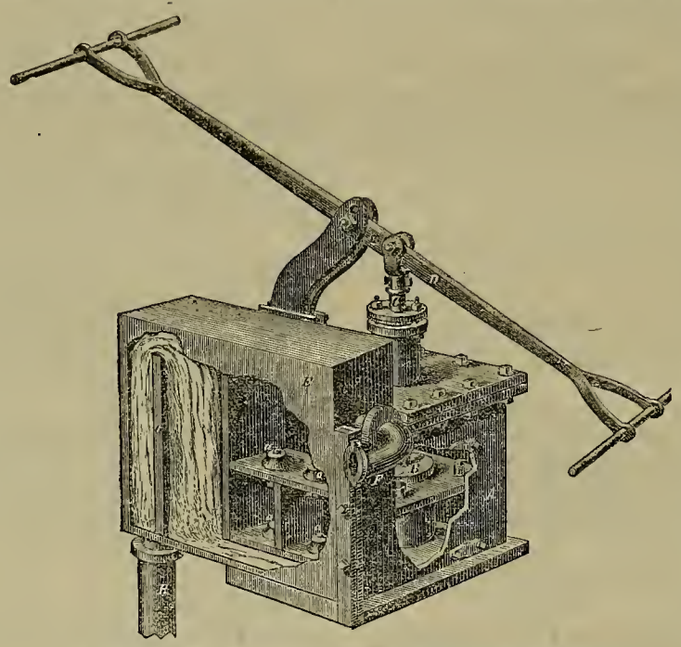
The piston *B* is in the form of a cylinder, and is turned perfectly smooth, so that the packing, which is fastened around the opening in the diaphragm through which the piston works (shown in the center of the case), shall fit it and make it water-tight, with no danger of cutting the cylinder or piston by the introduction of sand or other foreign substances; for, in making a stroke, the tendency of any such substances would be away from the packing, instead of towards it, as in other pumps. The piston may be moved by the double lever *D* or other device.



CLARK'S DETACHED, DOUBLE-ACTING LIFT AND FORCE PLUNGER PUMP.

The valve chamber *E* contains the valves *a a a*, the two lower ones of which are induction valves, and are situated one in each of the two lower chambers, while upper or eduction valves open into the upper or air chamber, from which the water is conveyed away by the egress pipe *F*. The valves do not occupy all the space within the case *E*; there being a large space to the left, which also extends beneath the valve chambers, as shown. This space is divided off by a partition *G*, so that as the water is received from the feed pipe *H*, it is caused to pass over the top of the partition *G* into the vacuum chamber, and thence beneath the valve chambers. This arrangement gives the sand or foreign substances which may be in the water an opportunity to settle before reaching the valves, which are still further protected by placing them on raised seats, which give little chance for anything to lodge. Guiding wings are attached to the valves, so as to insure their motion in a direct line. As the space between the partition and the valves is always full of water, the valves will always be submerged, and there can be no trouble from leakage. The inventor is confident that the pump will draw water freely thirty feet, and will force it 400 feet high or more, if required.

The patent is dated May 18, 1869, and is one of several obtained through the MINING AND SCIENTIFIC PRESS United States and Foreign Patent Agency.

One of these pumps is on exhibition at the Mechanics' Fair, where it can be examined, and will be explained by the inventor either at that place or at his place of business, No. 31 Third street, in this city, where orders may be left or further information gained.

The pump on exhibition is ornamented with silver plating. Visitors who test its working express themselves astonished at the amount of water thrown for the power exerted—a simple stroke causing the flow of a bucketfull of water.

AN IMPORTANT INVENTION.—We mentioned in a late issue, that A. B. Bowers, C. E., of Petaluma, had taken steps to secure, through our agency, his right to a new invention. A few days since, we accepted his invitation to witness the operation of a working model constructed for the purpose of showing and testing the principle upon which the machine acts. We purpose publishing an engraving and full description at some future time, and therefore content ourselves at present with saying that it is a Steam Excavating and Embanking Machine, designed for the reclamation of our swamp and overflowed lands. It cuts a broad, smooth, deep ditch, depositing the pulverized earth in a triangular embankment, the base of which is a short distance from the side of the ditch; or it dumps it into a car, if desirable, to remove the dirt to a distance. It is claimed by the inventor to be capable of doing the work of more than five hundred men, and at much lower rates than it can be done by the Chinamen who now monopolize this kind of labor. Engineers who have seen the model in operation, have expressed the opinion that these estimates of the working capacity of the machine might be doubled with entire safety.

CHIEF ENGINEER.—Mr. John L. Constable, the well known mechanical engineer, has been appointed to fill this office. Mr. Constable is not only a first-class machinist, but an inventor of practical merit, and he has long been identified with precisely the kind of machinery that he here has to do with.

ANNA E. DICKINSON, one of the very noblest and ablest women of the times, departed for the East on Monday, with the earnest good wishes of a host of new-made friends on the Pacific shores. She numbers her friends among the rich and poor.

State Agricultural Fair Premiums.

These are announced in the Sacramento papers, summing up in cash, to the sum of $30,000. J. S. Curtis, of Yolo, the introducer of peanuts into California, was awarded a diploma, and a $2 premium. The cultivation of peanuts is now quite a business on the Yolo banks, having superseded importation altogether, and retained at least $50,000 a year of our gold in circulation here. The Sacramento hop raisers, Clark, Hanio and Merkeley, obtained special recognition. Mathew Cook received a premium for his blasting wedge, which will be visible, probably, also at the Mechanics Fair in San Francisco; W. B. Ready's three-gang plows; Lanseu & Schafer's wine coopering, Mrs. E. F. Aiken's raisins, and C. W. Hoit's figs, were particularly approved; besides which, there is a long list of names meritorious, for apples, pears, figs, potatoes, squashes, cabbages, grain, and stock, both slow and fast, etc.

Gold and Silver Medals.

A gold medal, known as the "Institute Medal," valued at $200, will be awarded to that invention, industrial product, or manufacture, which, in the opinion of the judges, may be thought of the greatest benefit and value to the people of California.

There will also be a gold medal awarded the most valuable display of California products or manufactures, in each of the twenty-one classes, into some one of which everything introducted into the Pavilion is assigned—making 21 in all of the smaller gold medals.

There will also be awarded, as *special premiums*, sixty-three silver medals, which will be apportioned to the adjudged value of the several classes, and articles entered in competition for premiums.

THE COCOS ISLAND TREASURE SEEKERS.—The Panama papers report what is hoped will be the final return to that part of the Cocos Island treasure seekers. This enterprise was first set on foot in this city, some three years ago, since which time about $28,000 has been thrown away upon the foolish enterprise. Hunting for buried treasure, when so much demand exists for labor in really useful and profitable directions, is about the worst use to which money and time can be put.

SMALL MILLS.—Mr. A. B. Paul says: A complete mill to work a few tons per day; that will cost but little, weigh but little, and get more metal out at less expense. We must get over our high-horse ideas of big mills, and no dividends—work less rock and work it better. My motto for the future (and I have had, as you know, experience in large mills), is, small mills and large mines, instead of big mills and small mines, and too often no mines at all. Small institutions worked by miners on coöperative system will build up a country and reward the industrious, when waiting for capital won't pay, and going into large joint-stock institutions will pay less.

EXCURSION FARES.—Half price, or the fare one way only, is charged by all the steamboat, railroad, and stage companies at present, from points in the interior, to San Francisco and back. The "excursion ticket" is a shrewd invention of the carriers themselves, who find it quite as profitable,—in changing retail into wholesale business,—as it is advantageous to the public, on occasions of general migration or congregation.

INTERNATIONAL INDUSTRIAL EXHIBITION AT BUFFALO.—The Canadians, preparatory to annexing the United States, are cultivating industrial and commercial relations to pave the way, by the International Industrial Fair, which is to open shortly, in October,—before our Mechanics' Fair closes. Horace Greeley will deliver the opening address.

HOT AIR TO BE SOLD AS GAS IS SOLD. Experiments are being made in Springfield, Mass., by a gentleman formerly eugaged in the U. S. Arsenal in that place, to test the practicability of supplying a city with hot air, as gas or water is now supplied, by pipes. The plan is to pass a great number of large iron tubes through furnaces, much after the manner of arranging the hot air blast for iron furnaces. These metal tubes will be connected with mains, constructed of a peculiar cement or fire-clay, which will be made of the most perfect non-conductors attainable for such purposes, and thus led through the main streets of a city, and delivered, by service pipes, whenever reqnired. It is proposed to lay the main pipes in a brick arch, lined with the same non-conducting material as that from which the pipes are to be constructed. It is claimed by the projector, that if the plan succeeds as well as it now promises, the cost of heating dwellings in cities can be greatly reduced; and, if required, can be furnished hot enough for cooking purposes. It is proposed that the air shall leave the furnaces at a temperature of 600° Fah. Baking, which requires the highest temperature of any cooking operation, can be carried on in an atmosphere of from 250° to 350°.

THE POISONOUS TOMATO WORM STORY has again started on its usual annual round. Somebody has found oue in San Leandro, aud sent it to the *Gazette* office, in a bottle. The *Hearth and Home*, a paper generally very correct in its statements, has given countenance to the reported poisonous nature of this worm. The sting, bite, or poisonous nature of the tomato worm is all bosh. It will bite nothing but the plant on which it feeds, and has no more sting than a tadpole. It is an ugly, disgusting looking worm; but if any unpleasant effects follow its handling or accidental contact, don't attribute them to the worm—look to something else for the cause.

ABSURD.—The editors of the Cincinnati and St. Louis papers, who are making great efforts to effect a removal of the national capital to those cities, urge as an inducement that congressmeu can get pure water at either of them. What do congressmen want with water? They are not fishes. It is the height of absurdity to think of tempting congressmen hy offeriug them water. Whisky-straight is as powerful a lever to move *them* as a bunch of carrots is as a motive power to a hungry donkey.

WHAT is the best way to curh a wild young man? To bridal him.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.
"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopatbic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.

To Quartz Mining Companies.
To be sold positively within the next three months—the MINES, ENGINE, MILL, and entire Machinery of the TEMPLAR NO. 2 Quartz Mining Company, located at Indiana Ranch, Yuba County, consisting of—
One Steam Engine, 60 horse power, made by Burden, Brooklyn, New York.
Two large Boilers, in complete order.
One Eight-stamp Battery.
One Chile Mill.
One Cornish Lift-Pump, 6 inches, of superior make and finish.
280 feet of 5-inch Iron Suction Pipe.
One large Water Tank.
And also all of the necessary machinery, with Belting, Feed Pumps, Hose, Turn Tables, Cars, Ropes, Track Iron, Flumes, Plates, with Blacksmith Shop and all Tools and requisite implements to be found in a large and first class quartz mill.
The Company having ceased operations intend selling off their effects as speedily as possible.
For Particulars as to price, etc., address, by letter or otherwise, L. W. CAMPER, at Indiana Ranch; GEORGE B. HORNISH, Marysville; or K. W. HASKELL, Pacific Fruit Market, San Francisco 24v18-1m

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

The following is a revised list of books interesting to our more special readers. The newest and most complete treatises on subjects within the scope of this paper, including local maps, pamphlets of value, etc., will be added from time to time:

ABBOTT, GORHAM D.—Mexico and the United States: Their Mutual Relations and Common Interests 2 00

ANTISELL.—The Manufacture of Photogenic or Hydro-Carbon Oils, from Coal and other Bituminous Substances, capable of supplying Burning Fluids. By Thomas Antisell, M. D. 1 vol. 8vo.. 3 00

BANCROFT'S Guide for the Pacific States 50

BARSTOW—Sulphurets; What they are, How Concentrated, How Assayed, and How Worked; With a Chapter on the Blow-pipe Assay of Minerals: 1 vol. 12mo. cloth 1 00

BLAKE, W. P.—Annotated Catalogue of California Minerals. 8vo 50

BLAKE, (W. P.)—Report on the Precious Metals at the Paris Ex., 1867. (To be had through Members of Congress.)

BRACE, C. L.—The New West. 1 50

BROWNE, ROSS—Mineral Resources of the Pacific States. San Francisco, 1868 ..... 4 00

BOURNE (John)—Handbook of the Steam Engine. Illustrated. 2 vol. 12mo, cloth 2 25

CADWALADER'S Map and Description of White Pine. San Francisco, 1869 ..... 1 50

COTTA, B.—Lithology. London, 1867. ..... 3 00

CONGDON.—Mining Laws and Forms of California and Nevada, and the Mining Ordinances of Mexico. 181 pp. 8vo: flexible cloth; 1864 ..... 2 50

CROOKS & ROHRIG'S Translation of Kerl's Metallurgy (not yet received here in full).... ..... 6 00

CRONISE (W. H. V.)—Natural Wealth of California 6 00

DANA'S Manual of Geology. Numerous Illustrations. 8vo. half morocco. Philadelphia, 1867. 6 75

DANA'S Text-Book of Geology. Illustrated. 12mo, cloth. Philadelphia, (School Edition) 1864... 2 25

DANA'S System of Mineralogy. New Edition. 8vo. cloth 10 00

DANA'S Manual of Mineralogy. Revised edition, 1868 ..... 10 00

ELDERHORST'S Blowpipe.—Analysis and Determinative Mineralogy. Third edition, revised. 8vo. cloth. Philadelphia, 1866 ..... 2 50

EVANS—White Pine. 25

FREY & WELL'S Topographical Railroad and County Map of California and Nevada.. 1 50

FEUCHTWANGER — Treatise on Gems. 6 00

GOODYEAR'S Translation. A Treatise on the Assaying of Copper, Silver, Lead, Gold and Mercury, from the German of Th. Bodeman and Bruno Kerl. 1 vol. 12mo. cloth 2 50

HITTEL'S (JOHN S.)—Resources of California; comprising Agriculture, Mining, Geography, Climate, Commerce, etc., etc; the Past and Future Development of the State. 12m., cloth. 1 50

HOSKOLD'S Practical Treatise on Mining Land and Railway Surveying, Engineering, Etc. 1 vol. 8vo. cloth 16 00

KUSTEL.—Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada: also, a description of the General Metallurgy of Silver Ores. By Guido Kustel, Mining Engineer. Illustrated by accurate engraving. 1 vol. 8vo cloth 5 00

KUSTEL.—A Treatise on Concentration of all Kinds of Ores: Including the Chlorination Process for Gold bearing Sulphurets, Arsenurets, and Gold and Silver Ores Generally. By Guido Kustel, Mining Engineer and Metallurgist. Illustrated with 120 diagrams on 7 plates. 1 vol. 8vo. cloth 7 50

LAMBORN.—Rudimental Treatise on the Metallurgy of Copper. 1 vol. 12mo. limp cloth. Illustrated 1 00

MITCHELL'S Manual of Practical Assaying. 1 vol. 8vo. cloth 10 50

MAKINS.—A Manual of Metallurgy, more particularly of the Precious Metals, including the Methods of Assaying them. By G. H. Makins. 1 vol. 12mo. cloth. Illustrated by upwards of 50 engravings 3 50

MAPS—Of Oregon, Idaho, Mexico, White Pine, etc., can be had at Bancroft's and Gensoul's.

OVERMAN (Fred.)—A Treatise on Metallurgy; comprising Mining, and General and Particular Metallurgical Operations. 1 vol. 8vo. cloth. 7 50

PHILLIPS (J. ARTHUR)—Mining and Metallurgy of Gold and Silver. New edition.) 8vo. Cloth 16 00

PERCY (John).—Metallurgy; the Art of Extracting Metals from their Ores, and adapting them to various Purposes of Manufacture. Iron and Steel. 1 vol. 8vo. cloth. 13 50

PLYMPTON—Practical Use of Blowpipe. 1868 ..... 2 00

Practical Use of the Blowpipe; being a Graduated Course of Analysis. 12mo. cloth. New York, 1858 ..... 2 00

POFFERN'S Useful Metals and their Alloys. 1 vol. cloth 5 60

RIMONIN, L.—Underground Life; or, Mines and Miners. Edited by H. W. Barstow, F. R. S. 160 wood engravings, 20 maps (colored), and 10 plates of metals and minerals in chromo-lithography 18 00

RIMONIN, L.—Undergrouud Life, or Mines Miners 18 00

URE'S Dictionary of Arts, Manufactures, and Mines. 2,300 Engravings. From last London Edition. 3 vols. 8vo. cloth. New York 16 50

WHEELER & RANDALL'S Quartz Operator's Handbook. Flexible cloth, 12mo. San Francisco 1865 ..... 1 00

WHITNEY.—A Geological Survey of California. Report of Field Work from 1860 to 1864. By J. D. Whitney. Per. vol. quarto 6 00

YALE'S Mining Claims and Water Rights. 8vo 7 50

New Almaden Vichy Water,

(CALIFORNIA VICHY WATER.)

FROM THE SPRINGS,

NEW ALMADEN,

Santa Clara County.

F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.

OFFICE, 506 JACKSON STREET,

GENERAL DEPOT:

Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the veinous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases wh re a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever*: Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs: the indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever*; Gout, *when the patient is still able to walk*; Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece.

Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v18tf

Ayer's Hair Vigor,

For restoring Gray Hair to its natural Vitality and Color.

A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a

HAIR DRESSING,

nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long on the hair, giving it a rich glossy lustre and a grateful perfume.

Prepared by Dr. J. C. Ayer & Co.,

PRACTICAL AND ANALYTICAL CHEMISTS,

LOWELL, MASS.

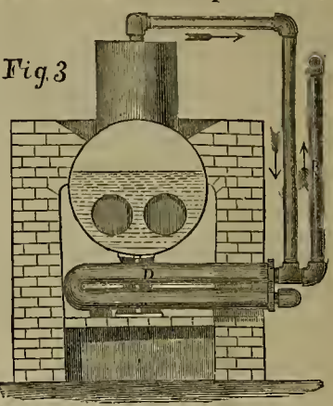
Important to every one using Steam for any purpose.

CARVALHO'S

Patent Steam Superheater

Fig. 3



[SECTIONAL END VIEW OF BOILER, WITH SUPERHEATER.]

Saves Fuel! Saves Water! Saves Pressure! Brief Extracts from letters from parties using Carvalho's Superheater. Full letters can be seen on application:

NAVY YARD, Washington, June 15, 1866.

"Superheater saves 12 per cent. in fuel and 10 per cent. more in speed of engine."

NAVY YARD, Washington, Oct. 8, 1867 (after *seven* years of service.)

"Superheater yet attached to boilers, and appears to be in good order."

HOWARD WATCH AND CLOCK CO., Boston, May 19, 1866.

"Superheater saves us at least 10 per cent. in fuel and gives a large increase of power."

JONES & SMITH, New York, March 21, 1867.

"Superheater saves 20 per cent. of coal, less steam pressure, exhanst more serviceable in drying paper."

STEAM ENGINE WORKS, South Brooklyn, April 23, 1867.

"Superheater saves not less than 20 per cent. fuel; no priming."

CROCKETT LEATHER CLOTH CO., Newark, N. J., Oct 16, '67.

"Superheater economizes 25 per cent fuel; does our work with 25 lbs. less pressure steam, and steam superior for drying purposes."

N. Y. DYEING & PRINTING ESTAB., Oct 4, 1867.

"Superheater brings contents of our dye vats to boiling point in one-third less time and one-third less increase of water; saves us at least 15 per cent. fuel."

CONTINUOUS OIL REFINING CO., Binghampton, N. Y., Sept. 20, 1867.

"Superheaters give entire satisfaction, and we superheat to 55° deg—an increase of 200 deg."

CAREY MANUF. Co., So. Hadley Falls, Mass., Oct. 17, '67.

"Superheater saves 15 or 20 per cent. fuel; steam for paper mill now perfectly pure and dry—an important advantage in our business."

STATEN ISLAND FANCY DYEING ESTAB., June 18, 1867.

"Superheater saves at least 25 per cent in fuel, and we have the advantage (hardly to be over-estimated) of perfectly dry steam."

ÆTNA IRON WORKS, San Francisco, Sept. 15, 1867.

"Superheater saves 25 to 30 per cent. in fuel; no priming."

CONTRA COSTA LAUNDRY, Oakland, July, 1868

"Superheater causes a use of 50 lbs. steam instead of 60 lbs.; use much less water, and there is a saving in fuel."

HAVILAH M. Co., Cal., August, 1868.

"Superheater causes a use of 40 lbs. steam instead of 60 lbs.; use much less water, and there is a saving of fuel." (2 sets.)

SIXTH MECHANICS' INST. FAIR, S. F. Sept. 4, 1868.

"Superheater used proves that it saves fully 30 per cent. in fuel." (Chief Engineer.)

NEVADA MILL, Virginia City, May 30, 1869.

"Superheater is a perfect success, and saves three cords of wood in ten, or 25½ per cent. in fuel; engine works better."

And many other letters of the same tenor.

Awarded Silver Medal, Mechanics' Institute, San Francisco, 1868.

Awarded Silver Medal, Maryland Institute, Baltimore.

Awarded Silver Medal, American Institute, New York, 1865.

The Railroad War—Tolls on Railroads.

The railroad war in New York has been called the work of a set of barbarians. The conduct of the principal actors, in those disgraceful scenes, has certainly been barbarous and outrageous. Railroad "operators" and monopolists may eventually find the end of their string and come to grief.

It was once, and we believe still remains a mooted question, whether railroads may not be brought under the regulations of toll-roads, the laws applicable to which allow any man to run his carriage or car over them, on the payment of toll. If we are not mistaken, the principle involved in the claim set up by John W. Richmond, of Providence, R. I., some thirty-five years ago, of his right to run cars of his own over the Boston and Providence Railroad, has never yet been adjudicated in any court. Dr. Richmond built his depots at each end of the Boston and Providence road; placed his engines and cars upon short branch tracks, connecting with either end of that road, and called upon the Massachusetts Legislature to fix the tolls and proper running regulations for his cars. The lawyers looked into the matter upon both sides, and there appeared to be every probability that the Doctor would soon be running an opposition to the company upon their own road. If we are not mistaken, the company, rather than risk a suit, bought the Doctor off and paid him liberally for his "improvements." If private property is taken for public use, why have not the public a right to such use—why should it be exclusively confined to a privileged few? The signs of the times indicate that the telegraph must soon pass out of the hands of monopolists. Railroads may soon follow—the project is extremely simple and eminently practical. The end would be the addition of untold millions to the wealth of the country, as the result of cheaper transportation.

Mr. Franklin's Newspaper.

[From the Mechanics' Fair Daily Press.]

We desire to say a word of encouragement for our cotemparary, the *New England Courant*, which is printed and sold in this vicinity (where advertisements are taken in), by Mr. Benjamin Franklin, a young man of sound judgment, as appears sufficiently evident from the quality and dishing up of his news. We think that Mr. Franklin is just a little slow in his method of inking his type, with buckskin balls, though he may be doing as good work, perhaps, as others can lay claim to with their new fangled printing contrivances. Mr. Franklin's Limner, we will ventnre the opinion, goes out sketching when the weather is too foggy; his horse, and his ship, and his young damsel do not look quite natural to us—unless the draught was taken very early in the morning. Everybody, however, will admit that he cuts tastefully.

"No generous and impartial Perfon," says Mr. Franklin, "can blame the prefent Undertaking, which is defigned purely for the Diverfion and Merriment of the Reader. Pieces of Pleafantry and Mirth have a secret charm in them to allay the Heats and Tumours of our Spirits, and to make a Man forget his reftlefs refentments. They have a strange power to tune harfh Diforders of the Soul, and reduce us to a sereue and placid State of Mind." In this sentiment the publisher of the Fair Press heartily concurs.

We must find fault with the proof-reader of the *Courant* for his carelessness with regard to figures; according to his blundering head lines, this Fair is being held in A. D. 1723! Where were we in 1753? Shades of Drake! That was the period when the East India House was built; when George I, Prince of Orange, only recently called over the water from Hanover, was King. The Fair Press has it A. D. 1869. His Majesty's most gracious speech, quoted in the *Courant*, does not refer to George I, but is merely another product of the Emperor Norton's.

In regard to the name, *The New England Courant*, Mr. Franklin has exercised a good choice, for what other name would sound so well in New Albion? We should have called it *The New Albion Courant*, which amounts to the same. It is safe to predict for our friend's Undertaking a general Acceptance in Town and Country.

Mr. Newell delivers the *Courant* to its patrons. E. F. Hartshorn, of Cubery & Co., is the responsible publisher.

A Railroad to be Illuminated.—It is reported that Fisk is going to light the Erie Railway with the electric light. He has commissioned E. C. Morse to make the arrangements. It is said that the work will be completed in three months. Mr. Morse claims to have made several inventions in connection with this light. It is said that in the project alluded to the electricity used to run the lamps will be collected by the friction of the wheels of the train.

From Across the Plains.—Mr. W. F. Herrick, who went East as agent for the Mechanics' Institute Fair, returned on Monday. He reports quite a number of interesting things for the exhibition, amongst them a Pullman car, which is coming to the Fair via Livermore Pass, San Jose and the street railroads, as ocular evidence of through connection.

Locher Steam Plow.—The model of this plow is to be seen at the right of the entrance of the Pavilion. It has attracted universal attention at the State Fair. It is a complete working model with four drivers, and the soil is turned over the same as by an ordinary plow. *

British Letters Patent.

The invention must be new in the kingdom, but may have been used and published abroad at the date of application. An invention patented in America may be secured at any time during the life of such prior patent. The application must be limited to one invention. The invention must be useful to support a patent, and there is a *nominal* investigation of its merits, by the law officer—Attorney or Solicitor General.

The actual inventor or first importer—a native or foreigner—and the resident legal representative of a deceased applicant, may become a patentee. The first importer or communicator need not be the actual inventor, or even meritoriously connected with the invention. There is generally no remedy for the actual foreign inventor who has been anticipated in his application by a first importer or communicator. A joint inventor cannot secure a patent in his own name, but may, when residing abroad, singly communicate the invention. A minor or married woman may secure a patent. It is for many reasons advisable to secure British patents in the name of a resident agent.

The first stage of a patent is "provisional protection." The invention is protected from date of filing. To complete the patent, "notice to proceed" must be given within four months, "warrant and seal" be applied for within five and a half, and "complete specification" filed within six months when not lodged with the petition. The application may be abandoned at any stage. The invention may be worked and negotiated under the "provisional protection," but an assignment cannot be recorded or properly made before the issue of the patent. The grant of the patent may be opposed within three weeks of the publication of "notice to proceed." The patent *may* be completed two months from first application. A limited extension of time may be obtained for taking the several steps when failure has arisen from accident or death of applicant. No model or specimen can be deposited. No patent of addition is granted, but disclaimers are allowed, and a duplicate patent, in case of the loss of the original, may be obtained. The patent is granted for fourteen years, but expires with a prior foreign patent. An extension, not exceeding fourteen years, is sometimes granted, or the patent may be annulled for good reasons. A stamp duty is payable at the end of the third and seventh years of the patent. The patent-right does not extend to the Colonies. An assigoment, to convey the title, must be recorded. The patented invention may be freely imported, subject to the revenue laws. Either joint patentee may make and sell the patented article for his sole benefit. The law does not require the invention to be worked. The patent right extends throughout Great Britain, Ireland and Scotland.

French Letters Patent.

The invention must be new in the empire, and should not have been made public use of abroad, at the date of application. The invention must be industrial, and not opposed to the laws, public safety, or morals. Medicines, remedies, financial and credit schemes are not patentable. There is no official investigation to determine the novelty or utility of the invention.

The inventor or author—a native or foreigner—may obtain a patent. The proprietor of an invention, though not the actual inventor, may now legally become a patentee. A corporation or firm may also obtain a patent. Joint inventors should join in the application. A patentee or registered assignee may obtain a certificate of additional improvements.

There is no provisional protection—the application must be made complete. The invention is protected from the day of filing the petition. The application is secret, and no opposition can be entered. No model or specimen is required. The patent is issued about four months after application, and extends over the colonies. A patent grants the right to freely make, use, and vend, but not to import the invention. The courts are inclined to sustain patents, and the laws are severe against infringers. The patent is granted for fifteen years, but expires with a prior foreign patent. No extension is allowed. A tax is payable annually in advance—no days of grace. The invention must be worked [or samples offered for sale] within two years of date of patent, and a "permit" is requisite to introduce a specimen.

Belgian Letters Patent.

The invention must be industrial. The invention must not have been commercially worked in the kingdom, or fully described in any Belgian publication before the date of application. The prior working or publication abroad does not affect the patent. There is no official investigation to determine the novelty or utility of the invention.

The actual inventor—a native or foreigner—or the assignee of the foreign patentee may obtain a patent. The foreign patentee, or the proprietor of the invention, though not the actual inventor, may legally obtain a patent. The *mere* importer, or introducer, is not entitled to a patent, though he may obtain one practically operative. The grantee or his registered assign may secure a certificate of additional improvements.

There is no provisional protection, the application being made complete. The invention is protected from the day of application, and no opposition can be made to the grant of the patent. No model or specimen is requisite. The patent is issued about two months after application. The patented invention may be freely imported, subject to the revenue laws. The patent laws are liberally interpreted by the courts in favor of the patentee. The patent is granted for twenty years, but does not continue after the expiration of all the prior foreign patents. There are no extensions. A tax is payable annually in advance—six months' grace with penalty. The invention must be worked within one year of its being worked in France, or, when no French patent has been obtained, within one year of its being commercially worked in any other foreign country.

Austrian Patents.

The empire includes Austria and Hungary, contains thirty-five millions inhabitants, and covers one hundred and thirty thousand square miles. The industrial interests of the country are making rapid progress, and few European states afford a more promising field for the introduction of new inventions.

The subject-matter of the Austrian and Hungarian patents must be a "discovery, invention, or improvement, having for its object a new product of industry," or "new means or mode of production," not worked or publicly known in the empire at the date of application.—Medicines, edibles, and beverages are not patentable, nor inventions opposed to sanitary laws, public regulations, interests, safety or morals.—An invention patented abroad may be patented at any time during the currency of the foreign patent.—A patent will not be granted for two distinct inventions—they must relate to the same object as "component parts or operative means." There is no investigation of the novelty or *general* utility of the invention, but the application will be rejected when the specification does not clearly explain and define the invention, or when it relates to any one of the prohibited subjects.—The officials now strictly enforce these conditions.

The patentee should be the inventor, his assignee or authorized agent—a native or foreigner. A *mere* importer is not entitled to a patent, but no proof of invention is required by the office, and patents of importation are generally operative.—The proprietor of an invention, though not the *formal* assignee, may obtain a valid patent in his own name or the name of an agent.

The application is made by filing a petition, duplicate specifications, and two sets of drawings. The specifications, in the German language, may be "open" or "secret." When "secret," they cannot be inspected by the public before the expiration of the patent. The local agent, to secure a patent in his name for the owner, requires no power, but to secure a patent in the name of a foreigner, he requires a legalized French or German power, and sometimes the foreign letters patent or a certified copy is demanded.

The duration of the Austrian and Hungarian patents is fifteen years, subject to the expiration of the prior foreign patent. When obtained for a shorter term, which is usual, they may be annually extended.—The Austrian and Hungarian patents are dated and expire the same day, and both must be presented at the ministry before the expiration of the term, calculated from the *issue* of the patents, to obtain a prolongation. The invention should be worked within one year of the date of issue, and the working should not cease for any two consecutive years,—the failure to work the invention renders the patent voidable. An extension of time for working is sometimes granted.

DEWEY & CO.,
U. S. and Foreign Patent Agents,
No. 414 Clay st., San Francisco.

Call Attention

To the special merits of your articles on exhibition by advertising them in the Mechanics' Fair Daily Press. The paper has a wide and extensive circulation amongst the most live people of the day, and you and your wares will become known to thousands that would otherwise know you not.

Costa Rica Mahogany can be had on very reasonable terms of Hobbs & Gilmore, Market street, near Beale. ***

To have a good look at the distinguished visitors from the East, and compare them with our own business men, use Muller's opera glasses and Brazilian pebble spectacles. ***

Returned.—Dr J. H. Paine, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. Howland.

Dr. Hall has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Ors. Curling, Druit, Lee, Parker, Acton, Aitken, Churchill, Ricord, Velpeau, Boech, Sperino, and Newilz Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco 3m

Use Pain Killer for Cholera and Bowel Complaints, for Boils, Cuts, Bruises and Scalds, Old Sores, Sprains, Swelling of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Frosted Feet, Felons, **Sore Throat, Sudden Colds, Coughs, Etc.**

Use it for any of these, and you will never do without it. Its success as a valuable family medicine has induced others to initiate and counterfeit the Pain Killer to some extent. *Beware of Counterfeits!*

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

☞ Agents for Blake's Patent Steam Pump, (warranted the best in the market); Davis & Furber's Woolen Machinery, etc. Being the selling agents for most first class Eastern builders, millmen and others in want of Machinery can save money by giving us a call. Illustrated Catalogues sent free.

Kustel's Treatise on Concentration of all kinds of Ores.

Including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally. Illustrated with 120 Diagrams on 7 Plates.

CONTENTS:

I.—INTRODUCTION.

1. The Dressing.—Dressing of Ores; Principles of Dressing; Division of Dressing.

2. The Separation.—Separation of Gangue from Ore in the Mine; Dressing of Ores outside the Mine; Separation by Hammers; The Ragging; The Spalling; The Cobbing; Separation by Hand; The Picking.

3. Cleansing and Sizing Contrivances.—Washing and Sizing; Stationary Apparatus; The Sluice; The Kiln; The Step Sluice; Movable Machines; The Hand Riddle; The Roeker; The Circular Hand Riddle; Swinging and Jarring Riddles; The Jarring Riddle.

4. Rotary Sizers.—The Trommel or Drum; Cylindric Trommel; Prismatic Trommel; Conical Trommel; Combined Trommel; The Sifting Wheel; Sizes of Gruins for Jigging.

II.—REDUCTION.

1. Redaction of Ores.—Reduction of Ores to a Proper Size; Breaking nuder Heavy Stamps; Reduction by Rock Breakers; Hanscom's Crusher; Blake's Quartz Breaker; Reduction by Stamps.

2. Description of Batteries.—The Fonndation; Mortar Blocks; Frames; Iron Frames; Howland's Rotary Battery; The Straight Iron Battery; Bryant's Battery; Wright's Iron Battery.

3. Details of a Battery.—The Mortar; Stem or Lifter; Shoe or Pestle; Socket or Head; Tappet; California Tappet; Cams—Wooden Cams; Iron Cams.

4. Speed, Curve and Order of Lifts.—Limit of Speed in Crnshing; Construction of the Cam Curve; Order of Successive Stamp Lifts; Hanging-up of Stamps.

5. The Discbarge of Batteries.—The Discharge in Dry Crusbing—with Grates; without Grates; with Sieves; Dust Chambers; The Discharge in Wet Crushing—the Grates and Screens.

6. Feeding of Batteries.—Hand-Feeding; Stationary Hoppers; Movable Hoppers; Quantity of Water for Crushing; Remarks on Speed aud Weight of Stamps.

7. Reduction by Rolling Mills.—Construction of Rollers; The Frame; Feeding of Rollers; Remarks.

8. Grinding.—The Arastra or Tebama; The Edge or Chili Mill; Ball Mills; Lundgren's Pulverizer: Cylinder Mills; Ferrand Mill; Hopkins' Grinder; Horizontal Mills; Iron Pan Grinders.

9. Paus with Plane Mullers.—The Common Pau Grinders; Tub Griuder; Bartolo's Grinder; Knox's Pan; Varney's Pan; Wheeler's Pan; Union Grinder; Moore's Quartz Grinder; Gaston's Grinder.

10. Pans with Conical Mullers—Hepburn & Peterson's Pun; Belden's Pan; Baux & Guiod's Grinder.

11. Pans with Tractory-Conical Mullers.—Excelsior Pan; Wheeler & Randall's Pan; Excelsior Continuous Grinders.

12. Pans with Perpeudicular Mullers.—Tbe Centrifngal Ore Grinder; Varney's Quartz Grinder.

III.—CONCENTRATION.

Concentration of Reduced Ore.—Division.

A. Concentration of Ore Grains (Jigging Stuff).—The Principle; The Jigging.

2. Movable Jiggers.—The Movable Jigger.

3. Stationary Jiggers.—Hydraulic Jigger; Petherick's Separator; Stationary Jigger.

4. Coutinual Jiggers.—Percussion Jigger, Setz Herd); Continual Cylinder Jigger; Continual Jigger; Hydraulic Continual.

5. Rotary Machines.—The Rotating Cylinder (Strom-setz Maschine); Rotating Wheel (Setz-Rad); The Dolly Tub; Auferman's Dry Jigger.

B. Concentration of Ore Sands and Slimes.

6. Assorting of Sands.—The Labyrinth; Borlace's Slime Separator; Ph. Hofmann's Separator; Rittinger's Funnel or Pointed Box; Rittinger's Spitz-Lutte.

7. Feeding of Concentrator.—Feeding-Boxes; Stationary Feed-Box; Rotating Feeder.

8. Stationary Concentrators.—Hand Bnddle; Sleeping Table; Rack; Sweeping Tables; Round Buddle; Concave Buddle; Blanket Tables.

9. Percussion Tables.—Percussion Tables; German Percussion Table; Continual Percussion Table; Hunter's Continual Percussion Table; Varney's Pereussion Buddle.

10. Oscillating and Shaking Tables.—Borlace's Concentrator; Hendy's Concentrator; Hungerford's Coucentrator; Barron's Concentrator.

11. Steady Moving Concentrators.—Coneave Rotary Buddle; Convex Rotary Buddle; Burton's Table; Self-Discbarging Blankets; Horizontal-Moving Blanket.

IV.—SPECIAL CONCENTRATION.

1. Concentration of Gold Ores.—Concentration of Gold Ores; Amalgam of Gold Quartz; Amalgamation and Grinding; Combined Coneentration and Amalgamation; Treatment of Coucentrated Stuff.

2. Concentration of Silver Ores; Coneentration Works; Cost of Coucentration; Concentration of Tailings.

3. Coucentration of Lead and other Ores.—Coucentration of Lead, Copper and other Ores; Value of Ores for Concentration.

V.—CHLORINATION.

Extraction of Gold from Sulphurets or Arsencials by Chloriuation; Assay of Gold Sulphurets by Chlorination; Chlorination Process for Sulphurets; Loss of Gold in Roasting; Singlo Roasting Furnaces; Double Furnaces; Mechanical Furnaces; The Roasting Operation; Roasting with Salt.

Chlorination.—Damping of the Roasted Oro; Sifting; Production of Chlorine Gus; Lixiviation; The Precipitatiug Vat; The Precipitation; Cost of the Chlorinatiou Process per tou of Ore; Remarks.

Other Methods of Dissolving and Precitating the Gold from Sulphurets.—Chlorination at Reichenstein; Cblorination at Schemnitz; Calvert's Method for Auriferous Quartz; Extraction of Gold, Silver and Copper.

Quarterly and Monthly Editions.

At the end of each quarter a large number of our weekly issues for the preceding three moatbs are bouad np in book form, which, by special arraagement, are placed upon the ferry boats and various steamers leaviag San Francisco and other ports on the Pacific Coast, for free reading by the intelligent traveling public. The Quarterlies are also to be found in the principal libraries, depots, hotels, and free reading rooms of the Coast.

This, in addition to our Monthly Scries and large weekly circulation, makes the PRESS the BEST and CHEAPEST general advertising medium throughout the Pacific Coast. The value of ndvertising in our columns, however, is best determined by those who have tried it, and we respectfully refer to our patroas in that line. No paper in the Uaited States ean boast a better class, and no weekly paper on the Paciffe Coast receives as large a sum for regular advertising, or bas more constant or long-continued customers.

Job Printing.

We employ the best workmen in this department, and promise our customers—(many of whom have patronized the office for over eight years)—the best of work at very lair and uniform rates.

We are constantly adding new presses, type, and other material to our stock, making our facilities good for doing a wide range of work for merchants, mechanics, inventors, manufacturers, and tradesmen of all classes.

To Engravers and Electrotypers, for illustrating books and circulars, we pay particular attention, guaranteeing our customers satisfaction in this line difficult to be secured elsewhere.

Printing in colors, bronze, plain and ornamental style promptly done. Especial care given to working engravings

BLOW-PIPE ASSAY OF MINERALS.

By WM. BARSTOW, M. D.

Published by A. Roman & Co., San Francisco.

For sale at this Office.--Price, One Dollar.

With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 21v1ötf

Get Your Engravings

Made at the office of the MINING AND SCIENTIFIC PRESS in season for priating your circulars for the Mechauics' Iastitute Fair. Remember, a good engraving eaanot usually be made in a day.

Parties who wish first-class wood cuts and electrotypes for illustration in newspapers, pamphlets and trade circulars, should call at once and examiae specimens.

New Mining Advertisements.

Siempre Viva Silver Mining Company, District of Zaragoza, Sinaloa, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventeenth day of September, 1869, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 314 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-first day of October, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eighth day of November, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOUISE, Secretary.

Office, 314 California street, Up stairs, San Francisco, California sc11

Mining Notices--Continued.

Alleghany Consolidated Gold Mining Company, Sierra County, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the sixth (6th) day of August, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. certificate.	No. Shares.	Amount.

By order of the Board of Trustees.

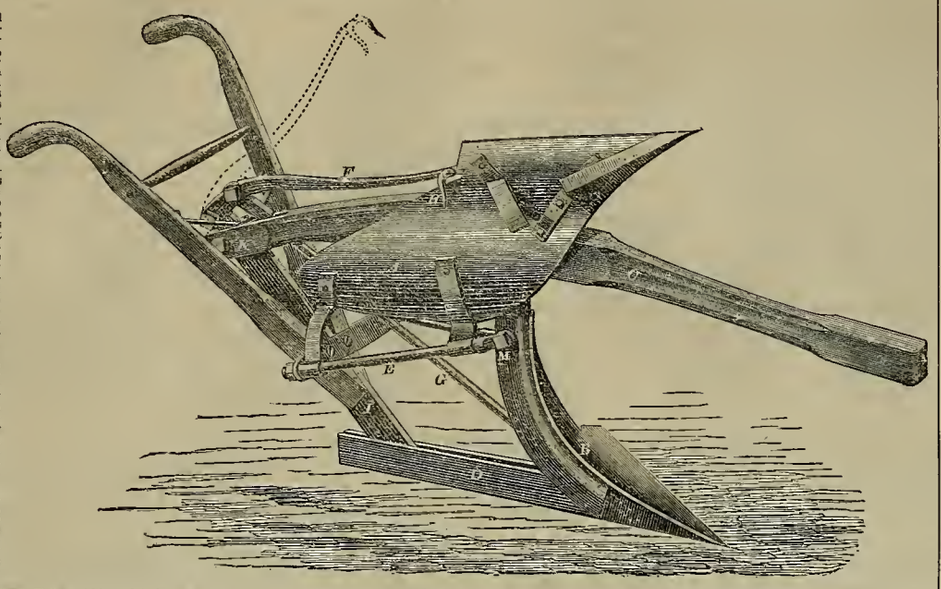
GEO. H RUSSELL, Secretary.

Office, No. 439 California street, San Francisco. au14

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low 10v17tf

SCOVILLE'S CLIMAX SIDE-HILL PLOW.



The advantages claimed for this new Patent California Plow over others employed for similar work, consist in its being so constructed that the plow which is not in use is thrown up in such a manner as to rest its weight upon the beam, as shown in the engraving, where the plow, A, is firmly held by the hooks upon the end of the iron arm, F. The weight of the upturned plow is thus made to aid in keeping the opposite plow to its work in the ground, while the balance of weight is so equally divided as not to give an excess on one side. Its position is also such that it does not in any way interfere with the plowing, and the person who holds the plow can see to handle it as readily as though the mold-board was not resting upon the beam. The handles are so arranged as to give to the holder a sure and easy control of the plow. The rod, G, is operated by the arm or lever, F, so as to lock the plow to be used in its proper position in the standard, by entering a slot in the toe of the land-side, D. When it is desirable to use a single plow (as on level ground) either of the mold-boards may be quickly removed by loosening the nut, M, and removing the rod, E, thus converting it into a single plow. The mold-boards are hung upon two angularly-placed axles, one of which belonging to the plow not in use is shown at E, with its mode of attachment to the axis. The plow may also be used double, as for ditching, etc., by slipping a cap over the joint of both plows when in proper position. The mold-board being made of the best of steel, and of a peculiar shape and great acuteness of sheer, will free itself or scour in all kinds of soil, and requires fully twenty per cent. less draft than any other plow of same size. It turns the soil so as to bury the stubble, and leaves the ground in a good condition for seeding. This Plow has been successfully introduced, the following parties, among others, already having them in use: J. J. Reed, Marin county; A. F. Scott, Centerville; George W. Shadd, Watsonville; James McCormick, Pescadero; and J. J. Wood, J. S. Gilchrist and J. B. Jones, of Spanishtown, San Mateo county, California.

TWO SIZES kept constantly on hand 10-inch and 12-inch cut, weighing 90 and 105 pounds. Price for each, **$35**, and with two extra Shares, **$40**. Will make any size to order. If, after a fair trial, the buyer is not satisfied, he can have his money back. Purchasers can depend upon every Plow being of good quality and make throughout.

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

NELSON & DOBLE,

AGENTS FOR

Thomas Firth & Sons' Cast Steel,

I. P. GALLAGHER. J. H. WEED V. KINOWELL.

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

QUARTZ OPERATOR'S

HAND-BOOK.

—BY—

WHEELER & RANDALL.

San Francisco, 1865.

A cheap and handy book for Quartz Prospectors, Millmen, and Amateur Assayers.

This little work, of 130 pages, although partly devoted to a discussion of limited interest to general readers, contains instructions in the WORKING AND ASSAYING OF ORES, AND TABLES FOR REFERENCE, which renders it quite desirable and of frequent service.

Price, $1, coin—$1 30 in currency or postage stamps. For sale by **DEWEY & CO.,**

1am Mining and Scientific Press, San Francisco.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

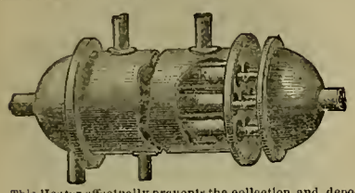
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the office, **220** Fremont street,

1vl San Francisco.

CROSS' COMBINED
Heater & Sediment Collector



This Heater effectually prevents the collection and deposition of sediment in the boiler from impure water. From April 1, 1869, the Royalty on this Heater has been

REDUCED 45 PER CENT.,

Which enables the Vulcan Iron Works, McAfee, Spiers & Co., Risdon Iron Works, of San Francisco, Keep & Bargion of Stockton, and Williams & Co., of Sacramento, the parties having the right to build them, to furnish these Heaters at greatly reduced rates. Send for Circulars to

The Most Important Invention of the Day.

HALL & LEE'S

New Method of Packing Stationary Joints in Steam Engines,

— AND ALSO IN —

STEAM AND WATER PIPES.

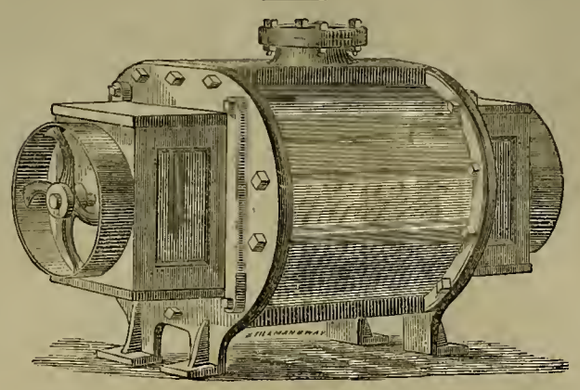
BY THIS METHOD OF PACKING THE JOINTS ARE made perfectly steam-tight inside as well as outside, thereby effectually preventing the steam from entering into the joints of the steam chest. Consequently, an Engine packed after this method will last twice as long as it will when other Packing is used; and the joints may be opened and closed every day, and they will be steam-tight every time they are closed, and the same Packing will remain good forever. Consequently, owners of mills will make a great saving, both in time and money, by having their engines packed by this method. Patented June 8th, 1869 By permission we refer to A. J. Binney, Supt. Northern California Railroad, and A. D. Starr & Co., Proprietors of the Buckeye Mill, Marysville. State, County and Mill Rights for sale by A. H. HALL & H. F. LEE, Marysville, Cal. 6v19-3m

Writers should be cautious about addressing correspondence relating to the business or interests of a firm to an individual member thereof, whose absence at the time might cause delay.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

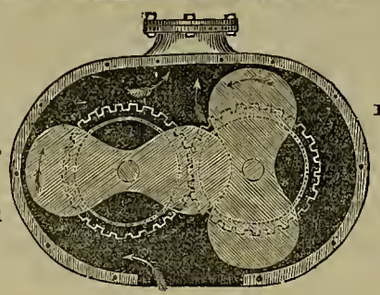
MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.



Awarded the First Premium at the Paris Exposition.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.



ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**

REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

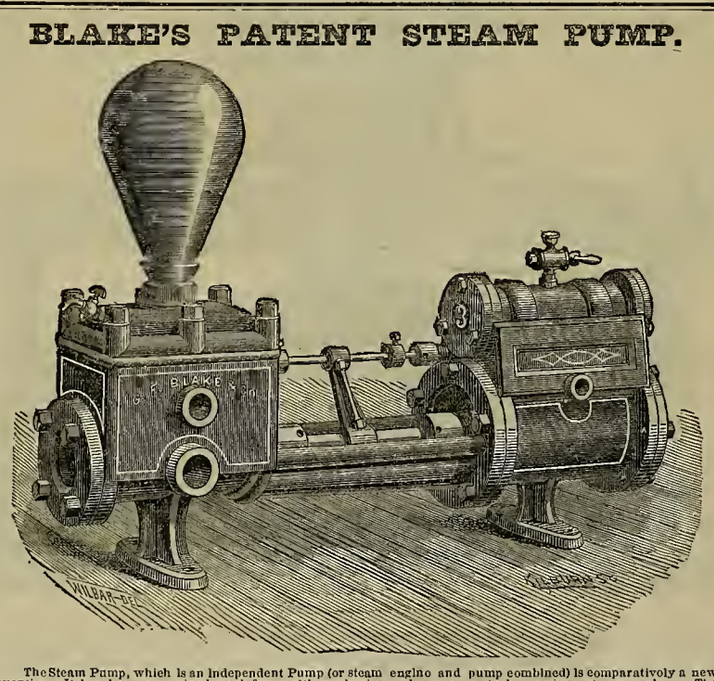
BLAKE'S PATENT STEAM PUMP.



The Steam Pump, which is an independent Pump (or steam engine and pump combined) is comparatively a new invention. It has, however, gained much favor with mechanics, and now seems to be coming into general use. The Pump, of which the accompanying engraving is a representation, is the invention of Mr. George F. Blake, of Boston. A poor description only can be given of it without a diagram of its interior mechanism. The water cylinder is shown in the left hand side of the cut, underneath the air chamber. This cylinder may be made either of brass or cast iron; but brass valve seats, and both hard rubber and brass valves are used. The water is taken in at the lower aperture, and there are openings on both sides, for convenience of suction and discharge pipes. It is a double-action pump, having double water valves, which are very simple. The water is drawn in and forced out from both sides of the piston head, which, with the strong and ample copper air-chamber directly over the valves, keeps up a constant and large flow when the pump is in operation. The steam cylinder in ordinary sizes is about double the size of the water cylinder. The small cylinder, directly over the steam cylinder, contains the steam valve, which is operated entirely by steam, having an auxiliary valve, which is opened by the arm shown on the piston rod, with each stroke, just sufficient to allow the steam to work the main valve quickly. This main valve is cylindrical, and by a patent device of Mr. Blake's is perfectly balanced, thereby overcoming all friction or pressure of steam, and allowing it to slide with the greatest facility, as the steam is admitted at either end of the valve cylinder. The construction of the valve and auxiliary valve is such that IT IS IMPOSSIBLE for the piston TO STOP "ON THE CENTER," which was a general fault with steam pumps prior to adopting the plan of driving the valve itself by steam.

This Pump took the first prize at the Maryland Institute in 1863; the gold medal of the Middlesex Mechanic Association of Massachusetts, the same year, and the gold medal of the Massachusetts Charitable Mechanics' Association; the New Hampshire Mechanics' Association, and the Iowa State Fair, in 1867.

It is positive under any pressure; may be run AS SLOW OR FAST AS MAY BE DESIRED; will discharge more water than others of same dimensions. The steam part being cast in one entire piece obviates the trouble of leaky joints. The steam valve is perfectly balanced, and it WILL START AT ANY POINT of the stroke, and discharge all the water of condensation. These Pumps are now very generally employed at the East as BOILER FEEDERS; in

SUGAR HOUSES, BREWERIES, TANNERIES, STEAMBOATS, Etc.,

And for MINING AND FIRE PURPOSES; twelve different sizes being now in the market, adapted to classes of work varying from a discharge of twenty to three thousand gallons per minute.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Bound Volumes.—Copies of the Daily Fair Press, bound and complete, and embracing a full report of all the incidents and history of the present Exhibition, to be delivered after its close, can be secured by early application at the office of the Press, in the Pavilion. Visitors, and persons who advertise, or have special notices in the Fair paper, will find it a very plesant thing, hereafter, to have bound volumes of this paper in their library. The history of a great Exhibition, like the present, is always worth preserving. Besides being useful for immediate reference, it will be read with increasing interest in after years. No library of any pretensions, in San Francisco, can afford to be without this volume. Only a limited number of copies will be bound, and those who are early to leave their names will be snre to secure copies. The volumes will be bound aud delivered immediately after the close of the Fair. Price, $2.50.

Important to Exhibitors.—Whatever is worth exhibiting at the Fair, with the view of selling afterwards, is worth advertising in the Fair Press. Moreover, exhibitors and inventors are not always on hand to explain their exhibits, or to answer the thousands of queries that any exhibit of interest is sure to call forth. A full description, in the columns of the Press, cut out and attached to the article itself, will be found a great advantage in this respect, and save a large amount of talking. Such information should be placed in the hands of the pnblishers of the Daily Fair Press, as will convey to the public the needed information.

Persons who have gone to considerable expense in getting up their exhibits should bear these facts in mind. A small extra outlay for advertising, will double the pecuniary advantage of your outlays, and come back to you in golden streams. The Fair Press is read by everybody, and sent East and all over the world by the thonsand, as the current daily reporter of the progress of the exhibition.

The Chilean Agricultural Exhibition. The distribution of prizes awarded at the Agricultural Exhibition, took place on Sunday, July 14th, at the Capital. Further reports have not been received.

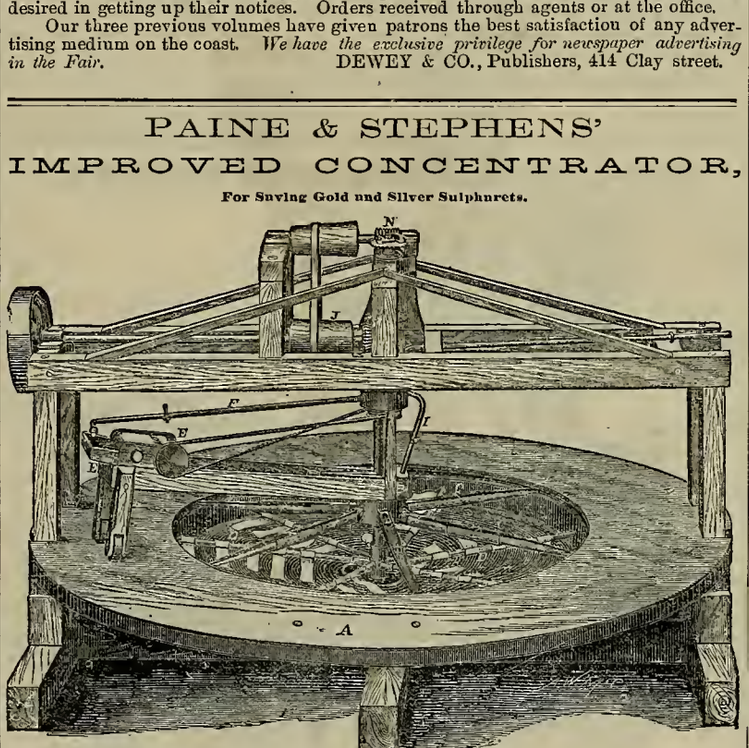
PAINE & STEPHENS'

IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.



One Machine, costing about $1,300, is sufficient to work the Sands from 25 to 30 Stamps,

Less power being required than for any other Machine. The attention of quartz millmen throughout the State is directed to the subjoined certificates, and if they desire they can visit the Amador Mining Co's mill, near Sutter Creek, the Eureka Co's mill at Grass Valley, or the Banner Co's mill near Nevada, and see for themselves.

CERTIFCATES:

Grass Valley, Jan. 4th, 1869.—This is to certify, that we have nsed the Paine, Stephens & Harry Concentrators for over twelve months. They have given ns entire satisfaction, and are the best we ever used. WILLIAM WATT, Supt. Eureka Minc.

This is to certify, that we have had in use for the past 18 months one of Paine, Stephens & Co's Sulphnret Saving Machines, constructed by John T. Harry, (called a buddle,) and which operates satisfactorily, particularly so in saving fine sulphurets, and we recommend it as well worthy of use, even where other Concentrators are used above it, as it will pay if there are any sulphurets.
WM. L. TISDALE, Supt. Star Spangled Banner Mine.

Nevada City, Oct. 26, 1868.

Any one wishing to purchase one of these nseful machines, can do so by applying to THOS. N. PAINE, at Grass Valley, Nevada County, or JOHN T. HARRY, Sutter Creek, Amador County.

Crucibles.

The Patent Plumbago Crucible Co.,

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never ernek, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co, Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S B Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other.
J. M. ECKFELDT,
Melter and Refiner, U S, B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENEBERG & MOORE.

Messrs A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Ha lidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gaurier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

Imparting Knowledge.

The art of teaching by public lectures to adults, or to the yonthful graduates nf university or collegiate classes, is of several different varieties. On the general snbject of teaching, Professor Phillips, tho well-known geologist, who possesses a high reputation for skill in imparting instruction, has remarked "that success in teaching depends not merely, or mainly, on tbe personal ability of tho teacher, but much more on his standing in the *right direction to his audience*. For conversational, *i. e.*, tutorial teaching, *one* class of mind; for public teachiug of large audiences, *another* ie required. Again; a teacher, whether by conversation, or lectnre, ought to *lead by short stages*. You cannot explain the preceesion of the equinoxos to a man who does not know what the rotation of the earth means.

The propriety of adapting the calibre of a discourse was well illustrated by the younger Dugald Stowart. The senior Stewart was well known to be possessed of a much higher character of intellect than bis more popular son. Au intimate friend of the latter one day asked him how it was that though inferior in ecientific knowledge to his fatber, yet he (the son) afforded more gratification, and was listened to by more numerous audicnces? The reply nf the son was one well deserving remembrance. "The reason," said Dugald the yonnger, "is because I always take care to never allnw my discourses to be more tban *two days* ahead of the requirements of my audiences."

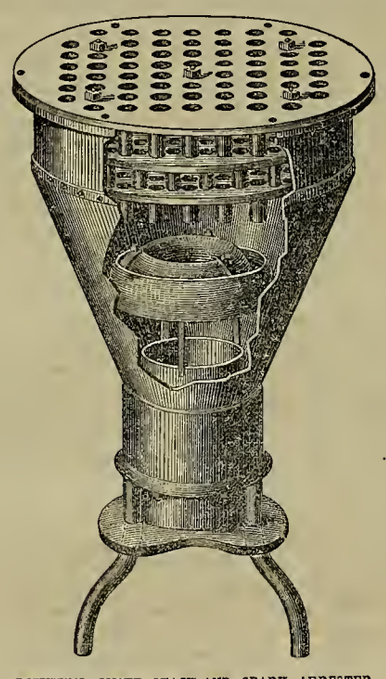
SOFT GOODS, COLORED FLANNELS, SILKS, etc., dyed scarlet and yellow, of late years has been found in many instances tn occasion inflammatory eruptions when worn next to the skin. Silk etnckings dyed a beantiful orange color have been found particularly deleterious in this respect; the dyeing agents in the latter named case being "picric acid," which is a derivative of phenol, or carbolic acid. Nitrogen is indispensible in the formation of picric acid, the compound being similar in physical properties to nitro-glycerine; it ie, however, explosive at lower temperature and percussion force than the latter named snbstance.

STOCKTON FAIR.—Tho San Joaquin Stock and Agricultural Implement Association will hold an exhibition, opening on September 25th and continuing until October 1st. During the exbibition addresses will be delivered suitahlo to the occasion; while rooms will be open overy eveuing for discussion on the products of the soil. Everything will be done hy tbe Managers to render the exhibition pleasant and profitahle to visitors.

HUNTINGTON'S IMPROVED SHINGLE MACHINE.—During the past season Mr. Huntington has furnished mills for Davis & Son, Carson; F. P. Brougham, White Pine; Jones & Co., Boca Station, Nevada; three to Truckee, and others in varioue quarters. Mr. H. bolds the right, on this coast, for Evart's patent.

Bowker's Smoke Stack and Spark Arrester.

We give herewith an illustration of Mr. John W. Bowker's improved Smoke Stack and Spark Arrester, a model of which is exhibited in the Pavilion, near the center of the machinery department. The object of this inventiou is to provide a device which shall serve to arrest the sparks which are usually forced out from the stacks of locomotive and other boilers, when the exhaust steam from the cylinders is discharged into the stack for tbe purpose of creating additional draft. This is accomplished, as shown in the engraving, by placing in tbe upper portion of the stack a seriee of perforated plates—three in number being fouud sufficient—eacb perforation being provided with a ebort tuhe, projecting downwards, and the tubee in each plate breaking joints with the one above or below. There is a small space between the bottom of each tuhe and the upper surface of the next plate below, and also betweon the outer edges nf the two lower plates and the inner wall of the smoke stack.



BOWKER'S SMOKE STACK AND SPARK ARRESTER.

When the engine or locomotive is in motion, tbe smoke, sparks and steam find their way into the upper portion of the stack throngb the upright inner tuhe, shown in the lower portion of the engraving, and pass up througb the central opening in the V-shaped circular trough seen above it; and wbile the smoke, gases and steam find tbeir way out into the atmosphero tbrougb tbe tubes, the sparks are arrested aud, with a small portion of condensed steam, fall back into the V-shaped trougb already noticed—the rush of steam through the center opening preveuting them from returning hack from whence they came. The bottom of the V shaped trough being open, allows the' sparks to fall in sucb a manner as to fiud their way between the outer wall of the discharge pipe, upon which the trough rests, and tbe inner wall of the stack; from thence they are conducted tbrough the curved tubes upon either side into the emoke box below, where tbey are mostly consumed by the intensity of the heat and draft.

By this arrangement the sparks from a locomotive are entirely arrested and oxtinguished, while the draft will not be in the least impaired. Numerous experiments bave been made with this spark arrester, and we are informed that not a spark can be seen issuing from tbe stack even on the darkest night. Railroad engineers who have used it inform us that, notwithstanding the fact of its arresting the egress of eparks, tbe self-discharging apparatus, in connection with the curved tubes already alluded to, is so effectual in its operations that less labor is required to keep it clean than in any of the ordinary contrivancee in use. We see no reason wby these spark arresters sbould not be placed on every railroad both here and at the East. If what is said of it is true, it must he an absolute preventive against tbe communication, by locomotive sparks, of fire to houses, timber, grain or grass—all of which suffer more or less from this cause, and often to tbe great cost of railroad companies.

A patent bas been recently allowed to Mr. Bowker through tbe MINING AND SCIENTIFIC PRESS PATENT AGENCY.

These spark catchers are in use on tbe California Pacific, Central Pacific, and the San Jose Railroads. The inventor, who is a practical mechanic and engineer, refers to Mr. Perkins, superintendent of the rolling stock and motive power of the Central Pacific; Mr. Masterman, master mechanic of tbe California Pacific Railroad, Vallejo; and to tbe proprietors of the Union Iron Works, San Francisco. Mr. Bowker may he addressed, care of H. J. Booth & Co., San Francisco.

Our Second Great Railroad.

Mr. Crocker bas resigned the superintentency of the Central Pacific to an old railroader, Mr. A. N. Towne, witb a view, it ie supposed, to devoting his own energies to a speedy completion of the California and Oregon road; assuming officially, for the preseut, the place of second Vice-President of the Company.

Those who were cognizant of the beginnings of the Central Pacific Railroad, in 1862-3-4, attribute to Charles Crocker's enthusiasm, as an influence exerted upon his fellow workers, an element of power directly bearing upon the carrying out of the scheme the importance of which, in pushing the enterprise to a head, was everything. Without such enthusiasm on the part of somebody, a fine idea or plan or theory, does not become a fact. It is a fine thing to plan; hut it is a better and nobler thing to execute. Thinkers are honored and appreciated by the intelligent; but doers are transformed into heroes by the world, and are honored, known and appreciated by everybody. Whose plan or idea the successful one may have beeu, does not matter much; the man who is happily born with "the enthusiasm to execute," deserves, and always gets, the credit.

A thousand Chinamen, says the Yreka *Journal*, are at present employed on the California and Oregou road. Thus we have good reasou for expecting to be able to travel to Oregon, if not to Puget Sound, by rail very shortly; and if Charles Crocker will put it througb for us as he bas done tho Central Pacific, the Pacific coast will remember him.

LANE & FULLER MINE, AUSTIN.—The annual report of this mine, for a copy of which we are indebted to the superintendent, Mr. C. C. Lane, shows that during the fiscal year ending July 1, 1869, the mine bas produced 1,029 558-2000ths tons of ore, which mill returne gave $224,050 38, averaging $217 68 per ton. The main shaft has been sunk to the depth of 445 feet, and levels run of 3,282 lineal feet. An additional engine of 30-horse power has been placed at the mine for pump, and a Cornish pump of 4-foot stroke and 6-inch bore has also been placed in the mine; a fire engine and a steam saw have been placed at the works. Total receipts, $251,554 56; expenditures, $212,833 08.

ANOTHER BRICK MACHINE.—Mr. Rider has placed another rather interesting brick machine, of 35,000 to 45,000 capacity per diem, into the Fair, not far from the large engine, which will be fouud at work making bricks to-morrow evening. It is Mr. Wrightington's, a new Boston patent, and works well.

Communications.

Co-operation.

BY DR. J. S. SILVER.

There is among the merchant class a manifest unfriendliness to coöperative industry. Merchants live and grow rich hy the poverty of manufacturers, and it is their supposed interest to keep down the makers' prices. Master manufacturers feel the same interest in keeping their workmen down. The more wokmen can be held from rising, the longer and the more the master can make out of them. When prices of goods advance, he thinks he ought to have all the advance. Is he not the master?

All this is natural and lawful. It is not in complaint of injustice that we speak of it. But if the manufacturer could make greater profit by coöperating with his workmen—by sharing with them the profits of their toil—be would willingly change his system. We propose to show that where master and men work together as co-partners, it is not alone to the greater profit of the men who work, but it is more profitahle also to tbe man who puts in his capital, in combination with their skill and lahor.

It is not an essay of speculative tbeories we would present, but the history of a long establisbed factory, now in full success, that affords actual proof (which will be as interesting to masters as to their workmen) that coöperation pays capital better than tbe principle of autagonism whicb the present system keeps alive; driving men to combine their forces till they finally emancipate themselves from its unfairness and its oppression. Overwhelming numhers, well marshaled, are sure to carry their point at last. We believe, however, that capital requires ouly such conviction as the followiug authentic example, to induce it to adopt freely and gladly a system which alone can reconcile all interests and be alike profitahle to all concerned.

Co-operative Iron Foundry.

At Guise, 90 miles northeast of Paris, is Lemaire's great foundry. Twenty years ago Lemaire, a disciple of Fourier, considered the idea of elevating the condition of his numerous working people. Though moved, in the first place, solely by moral cousiderations and religious convictions, his resolntion was not taken without thinking of its effects on bis business. From whatever point of view he regarded it, it seemed to him tbat, while conferring great benefits on his people, his own material interest would be advaneed in full proportion, and the sequel prnved the correctness of bis foresight. His first movemeut was to invest a million of francs, as a loan to his workmen, in the erection of a grand structure in which every family could have improved living rooms, with kitchen, garden, public hath and other comforts. A lecture room, library, and a theater, with regular free lectures, plays and concerts, and grouuds, with conveniences for picnics and field sports, formed an iudispensable part of his plan. He made all his men shareholders, and gave them to understand that they were not tenants, hut freeholders. By a system of small monthly payments, very easy to them, the whole cost of the property, now quadrupled in value, was liquidated, and now the whole is tbeir own, aud under their own management.

Soon after, he made a stock company of his great iron works; and he made all his men ehareholders by lending them capital on interest. He said, "you are not my hired lahorers, you are my associates, you have a voice in the affairs. When ynu save the scraps and improve the style and quality of work, it is for your own interest. My family and myself represent the capital, and we take the hurden of managcment and of sales and collections. Thus we earn our half, and you equally earn yours."

Now, oue-half of the establishment, with its great expansion since in the works and the value of the estate, is owned clear and entire by tbe workmeu.

In viewing this estahlishment, one is etruck with the peculiar neatness and intelligence of the workmen. In whatever department of the great iron works, ynu find every man you address, receives and answers you as if he were tho proprietor. He tries to convince you that it is your interest to give your nrders to "nur shops;" and he is ready with figures as to the cost, and with cousummate politeness he escorts you to the next department you desire to visit. In no case does any workman fail to make frequent mention of Monsieur Lemaire as the hest of men.

This wise and good man lives to see his henevolent plans realized. He is a father in the midst of a multitude of cbildren, who reverence and almost worship him. Ten thousand prayers go np daily to the throne of the Most High, invoking blessings on his head, and pleading before the Majesty of Heaven that his sainted soul may have a home in Paradise, hlessed and happy as tbat he has given to them on earth.

While we are hlindly engrossed with self-aggrandizement, piling dollar upon dollar, and selfishly counting ingots that give us much weight of care and small peace of mind, and to our fellow men nothing but stiut and hard exaction, let us give a moment's contemplation to this history of the good Lemaire. Is it profitable to follow his example, which, while it not impoverishes us, ennobles thousands and makes them happy, and secures us a final bome among the sprits of the great and good, the benefactors of mankind? Blessed are good on earth, for they shall he remembered in heaven.

Montana Notes.

[Written for the Mining and Scientific Press.]

Editors Press:—The town of Deer Lodge, from which we write, is the most unlike a mining camp of any in the mountains, and yet it is the most important place in Western Montana, and the supply point for an extensive area of gold-bearing country. Besides heing the county seat of Deer Lodge county, it is, among other things, celebrated as one of the oldest towns in the Territory, and as the site of the most unretentive jail in America—an institution that was never known to hold a prisoner long enough to hring him to justice. Withiu a few miles of this place gold was first discovered in Montaua Territory, seveu years ago, and "Gold Digger Tom" set up the first string of sluices near here, shortly after. Deer Lodge is surrounded by a large and fertile valley, the best stock range in this portion of the continent, and highly productive. Cattle and horses can here afford to work for nothing and "gruh" themselves, hesides rearing large and "ilegant" families for the benefit of humanity and the pockets of their owners. Talk about Texas for stock raising! It is nowhere beside tbis portion of Montaua; and our grass-fed beef, which annually adorns our Christmas stalls, will compare favorably with any to bo found in the United States, or any other couutry.

But tbis is not mining news. We are awaro of it. In fact, water is so confounded scarce that there are but few items afloat from wbich is to construct anytbing in that line. Streams which are usually from fifteen to twenty feet wide and two or three feet deep, now present dry and dusty beds, in whicb it would he necessary to prosecute considerahle well-digging before striking water, and the wholo country is as dry as A. Ward's hest joke; but it isn't a joke. Long ditches are an aggravation; expensive flumes are warping mockeries, and those who own the most "ground" are, for tbe time being, the poorest. Under sucb circumstances we are surprised that there are not more "dead hroke" and "flat on bedrock." We are surprised that Montana, under the discouragement of the dullest seasnn she ever saw, wears such a cheerful aspect and gives such good promise for the future.

Our new Governor, the Hon. James M. Ashley, formerly of Ohio, made a speech here last night, in the course of which be asserted that he was cnuvinced, after a careful collectiou of data, that Mnntaua had sufficient placer mining ground to keep employed two hundred thousand men fnr ten years. This scems a startling statement, when it is considered that the popu-latiou of the Territory never exceeded thirty thousand; hut it is doubtless true, or at least will be whenever labor hecomes as cbeap here as in California. As a means of secnring this cheap lahor, Gov. Ashley strongly recommends that steps he taken to induce an immigration of the agricultnral classes.

The agricultural resources of our Territory have heen greatly under-estimated. It has beeu difficult for the people of the States to conceive of a country in the Rocky Mountains in which stock can live tbe winter through, like garhage-gatherers, on what they can pick up, and where the season is sufficiently lnng for the raising of luxurious grain crops that would do credit to the most favored portions of the Union. The talk of isothermal lines is looked upon as a roping-in operation, a "bait for suckers;" and those who bave obtained their knowledge of the Rocky Mountains from Fremont's accounts are slow to credit tbe reports of to-day, well authenticated though they be. The great duty before us, as well as before you of Califoruia, now is to educate the people, not only of the States but of Europe. "Capital—give us capital." Fnr this every mining community lougs, and, failing to receive, makes it the burden of its vain regrets. With it, extensive ditches and flumes could he constructed, rivers turned, quartz mines developed, and a reign of general prosperity inaugurated. Too little thonght is, however, hestowed upon the fact that tbese same results may be ohtained by means of cbeap labor; and that lahor will hecome cheap just in proportion as the price of the necessaries of life is reduced. Hence one of the most sure, although indirect, methods of developing the mineral resources of a country is to foster agricultural pursuits, especially where, as in Montana, the conditions are favorable. Governor Ashley is now making a tour of the Territory, for the purpose of gathering facts and statistics to he laid before the people of the East and Europe, with the especial purpose of inducing an agricultural immigration.

Everywhere.

Deer Lodge, Montaua, Sept. 7, 1869.

Phillips' Portable Assaying Apparatus.

This is an arrangement for using the blowpipe on large assays of twenty grams, or furnace size, that is, twenty times the weight of the usual hlowpipe assay. Four blowpipe flames are made to uuite upon the assay; and tho heat is further concentrated or preserved at the point where it is required, hy a device original with Mr. Phillips, which we deem of value in the use of the blowpipe, viz: the application of a piece of coal above the assay, as a reflector and anti-radiator. Great ingenuity is displayed by Mr. Phillips in many ways—for the purpose of holding the assay automatically, to adapt it to the use of unskillod persons, to weigh and obtain the results at sight, to secure portability, etc.

The lungs, Mr. Phillips found, were easily capable of furnishing hlast for four blowpipes. He has here, however, removed the strain of continuous blowing, necessary in the ordinary blowpipe, by employing the priuciple of the water blowpipe whereby a column of water is blown up in a vertical cylinder, and tbe operator, who may be quite unskilled, can thereupon rest for a minute while tbe water does the blowing, before he repeats the operation.

Tbe fluxes aud all other necessary assaying articles are made to fit into the compact lahoratory, which is to be seen on tbe counter of Dewey & Co., and which weigbs six pounds, and is sold by Mr. Phillips for $100. The invention is specially intended for prospectors and travelers. Further particulars concerning its use can be obtained at Mr. Phillips' assaying and instruction rooms, No. 423 Washington street.

A Little Errand for Nothing.—Professor Hall and Rogers, of the U. S. Naval Observatory, at Washington, have just returned from the Siherian Coast, per U. S. S. Mohican, which was specially deputed by the Navy Department to carry them to the spot for the purpose of observing the eclipse ou the 7th of August. The superh iustruments were placed on favorable summits, and the professors waited, hut half an hour before the eclipse was to take place a cloudlet came, and eclipsed *it*—so that a journey half-way round the world was made for nothing.

The Pullman Palace Car.

[From the Mechanics' Fair Daily Press, Sept. 22.]

The Pullman palace dining and sleeping car—the first railroad car which has passed direct from New York into San Francisco—was placed on exhihition to-day, in a building especially prepared for its reception, on the soutb side of the Pavilion. A number of ladies and gentlemen, including memhers of the press, were invited to inspect it last evening, on which occasion a bountiful lunch was spread hy Mr. Gray, the gentlemanly agent of tbe Pullman Car Company. The car was carefully examined, and ample justice done to the good things liherally provided for the appetites of the visitors. Toasts were drank, speeches made, and the merits and comforts of this traveling palace freely discussed and admitted. Governor Low and lady, Captain Eldridge and others, were among the invited guests.

The ox car of '49 and the palace car of '69 are most suggestive of the rapid advances which have heen made in the comforts and conveniences of traveling during the last twenty years. Can it be that in so sbort a time, or, to go hack a little further, can it he that within the last *forty* years we have passed from the old time-honored slow coach mode of travel to the very climax of speed, comfort and convenience in locomotion? If not, what is to come next? What is to supersede the splendid floating and railroad palaces of to-day? How and where is the coming generation to improvo upon the present?

The car now ou exhihition is said to he the most complete and elaborately finished of any which the Pullman Company have yet constructed. It was built at Dayton, Ohio, at a cost of about $28,000, and has been secured for exhihition here through the efforts of Mr. W. F. Herrick, one of the managers of the Institute, who went East last summer to interest our Mississippi and Atlantic friends in the present Exhihition. The car is fifty-seven fect in length hy ten feet four inches in width. The inside finisb is of highly polished hlack walnut. It contains sleeping apartments, drawing-rooms, restaurant conveniences, pantry, etc. An elegant parlor organ is also added for the enjoyment of travelers. No description of its finish or of the general arrangement of the car can do it justice. To be appreciated it must be seen.

The Art Gallery cnntains several works of much merit. We are pleased with Mr. S. Walker's sunset effects, because he has reproduced many of the silent beauties of the "witching bour." John Wilson's two sea pictures evince tbe handling of a first-class artist. His great storm waves are nature itself—and we are there, in the midst of the scene, as long as we look at bis canvas. A good painting or engraving captivates the imagination, and it speaks constantly, to everybody and for all time while the light shines. The refining influence is unmistakable; exerted unceasiugly, as is the case where one's own choice selections adorn tbe chamber, tbey are an agency more powerful in shaping personal character than any other moral influence. A picture should be selected or appreciated for the sentiment nr idea it conveys.

Ores of the Base Metal Range, White Pine.—The "base metal" ores may be classed as oxidized and sulphureted lead ores, oxidized and sulphureted copper ores, quartzose sulphureted, and calcareous chloride silver ores. The first contain from 20 to 65 per cent. of lead, and yield hy fire assay from $40 to $120 of silver per ton; the second, from 12 to 25 per cent. of copper, and from $40 to $250 of silver per ton. The sulphureted aro richer than the oxidizcd ores, and it is probable that the latter will he replaced by the former, as the ledges are wnrked to greater depths.—*Writer in Sept. Overland Monthly.*

A New Name for a Familiar Subject. A Kentucky paper calls divorces, "severancer of conjugality."

Mechanical Progress.

The Chronoscope.

This is Capt. Noble's instrument for determining the velocity of projectiles in various parts of the bore of a gun; and was exhibited at the late meeting of the Institution of Mechanical Engineers in Newcastle. It consists,—says *Engineering*,—of half a dozen disks placed on an axle, these disks being put in motion by means of a heavy weight, and their relative velocity being regulated by a train of toothed wheels. An uniform and very rapid rotation was thus imparted to the disks; each of which bore a certain ratio to the one preceding it. Knowing the speed of one, therefore, they would readily calculate the rate of revolution of the most rapidly revolving disk; and by a special clock-work arrangement the precise speed to hundredths of a second could be indicated at any moment. The weight was so arranged that any required speed could be obtained. If it were exactly 1,000 in. per second, an inch of rotation at the circumference of the wheel would represent the thousandth part of a second; and so by an arrangement attached to the instrument, they were able to read to the thousandth part of a second; the time actually capable of being measured, so far as the rotation of the wheel was concerned, was the millionth part of a second. Captain Noble showed the mode of registration, which was effected by means of an induction coil. In measuring the velocity of a projectile, the primary wire of the coil was attached to any point of the barrel of the gun, or a set of wires might be so attached at intervals along the barrel, and at the instant of the passing of the shot, the wire or wires would be cut by the projectile, and an impression would be left upon the disk, which was covered with prepared paper for receiving the spark. Each of the disks might be attached to some portion of the gun barrel by a separate coil, and the precise moment of time at which the shot passed the identical spot would be most accurately recorded upon the disk.

CHECK UPON CAB-DRIVERS.—An ingenious French inventor has contrived an arrangement which will do away with all differences of opinion between cab-drivers and their passengers. Two dials are so placed in the cab as to be beyond the control of either party. One indicates the distance traveled, by means of a tell-tale hand moved by the revolution of the wheel; the other belongs to a clock which keeps that hand moving as soon as the wheel stops, so that the time spent in stopping and making calls is duly registered at so much per hour. The whole is thrown out of gear by raising a lever when the cab is disengaged. It being for the driver's interest to have as much paid for as possible,—since he gets a percentage of the receipts,—he will of course put down the lever as soon as he is hired; he must account to the cab-owner to the amount called for by a card in the interior of the machine, so he will not drive around without a passenger. Of course he can demand of the passenger no more money than the tell-tale calls for.

THE FIRST CIRCULAR SAW.—Lemuel Read, of North Brookfield, N. Y., sends the *Scientific American* the remains of the first circular saw in America. It was made by him in 1813, for splitting bass-wood boards for old-fashioned wheel-rims. It was of sheet-iron, and was run at a speed of 2,000 revolutions per minute. It worked admirably.

ALLOYS FUSIBLE AT LOW TEMPERATURES. While engaged in galvanoplastic experiments, M. Lalance used seven to five parts of bismuth to one to five parts of cadmium. The alloy which he thus obtained, fused at the low temperature of 66°. The most surprising feature in this discovery is that its difference from the other alloys consists in the addition of a metal of more difficult fusibility than any of those contained in the ordinary alloy. The cadmium by itself only melts at a temperature of 360° C. The other components, lead, bismuth, and tin, fuse at 312°, 276°, and 230° respectively. Another point worthy of note in the preparation of alloys is the peculiar use made of bismuth. The alloys of Newton, D'Arcet, Pelouze, and Wood, consist, to the extent of exactly one-half of their weight, of bismuth.

The next discovery in this field ought to be an alloy fusible at the ordinary temperature.—*Sci. American.*

OVERHEATING OF BOILER PLATES.—Mr. L. E. Fletcher, of the Manchester Steam Users' Association, says overheating often occurs simply from the character of the feed-water. That impregnated with carbonate of lime is worst. It forms but little scale, but deposits a fine loose flour, the amount of which is often overlooked, because it is so easily floated away when the boiler is cleaned. If grease be introduced into boilers in which this deposit is formed, the furnace crowns are found to give way, the plates to bulge downwards, and leakage to take place at the seams. The crowns come down gradually, little by little day after day. The grease is introduced into the feed water by blowing the exhaust steam upon it; and in the same way the floury deposit is made to constantly accumulate in the boilers. The manner in which the effect upon the plates is produced may be as follows: "This fine floury deposit, by thickening the water, interferes with the due escape of the globules of steam, so that they are kept longer in contact with the plates over the fire than they should be, and thus the intimate contact of the water with the plates become interrupted, and overheating is produced."

IMPROVEMENTS IN HEAVY TOOLS FOR IRON WORK.—In a late sketch of the Pittsburg Steam Hammer Works, the *Commercial* has the following:

"The company possesses the only traveling-head planer to be found in the country. The work to be planed is made fast to a massive iron table attached to the machine, and the tool travels over the work at remarkable speed. It is capable of planing the largest stand for steam hammers hitherto made in this country, and also planes the top and bottom of the stand with the same ease and mode of attachment—a feat not accomplished on ordinary planers. The traveling-head planer requires but half the shop-room demanded by the ordinary planer, which carries the job of work, and requires twice the length of itself. Another special tool is the radial drill press. This tool is capable of boring any number of holes in massive pieces of machinery in a radius of say forty inches, without moving the piece of work during the process; the machine itself being constructed in such a manner as to almost warrant the title of a universal boring machine, having extraordinary driving power, and an improved movable table connected with it, which enables the machine, in all its changes, to be controlled by a single workman unaided. Thus the changes in the work are made in half the time formerly consumed, besides obviating the liability to derangement."

PYROMETER FOR HIGH TEMPERATURES.—M. Lamy has devised an instrument which shows within two or three degrees Centigrade the temperature of a furnace heated to redness, and gives its indication at a distance from the furnace, so that at a porcelain factory, for example, a manager can sit in his office and see the temperature of all the furnaces in his establishment. It is merely an iron retort, containing marble. The neck communicates, by means of a tube, with a needle moving over a dial plate. As the heat rises, the marble is decomposed, and carbonic acid set at liberty. A special contrivance measures the tension the gas arrives at, and as this has a direct relation to the temperature, the measure of the one is made the measure of the other.

ANOTHER GALVANIC PROTECTION FOR IRON VESSELS.—A method of protecting iron vessels against rust and corrosion has been proposed by MM. Dance and Bertin. They contemplate the conversion of the hull of the iron vessel into a galvanic battery, by placing, inside the hull, pipes and tanks made of zinc and filled with sea water, and connected by means of bolts and rivets in metallic contact with the outer side of the vessel. They also design to use strips of zinc on the iron plates of the vessel immersed in the water.

LOCK FOR NUTS AND BOLTS.—A Connecticut man has invented a simple but effectual method to prevent nuts and bolts from working loose by unscrewing. It consists in the application of a left hand screw, fitted into the end of the bolt, so that its end will partly cover the end of the nut.

Scientific Progress.

Prof. Hendricks on the Beginning of Worlds.

The following is part of an article by Prof. Hendricks, in the Boston *Journal of Chemistry*: "I have assumed it as admitted that the ether is everywhere present throughout unlimited space. The *nebular hypothesis*, which in its main features receives additional support from every new discovery in astronomical science, assumes that the solar system, and by analogy every other system of the universe, once existed in an ethereal or nebulous condition, occupying at least all the space included within the orbit of the remotest planet, and that, from *some* cause, which is called *gravity*, its parts have been isolated and consolidated into their present condition. Now this hypothesis, of which I count myself a believer, has failed to account for the commencement of the consolidation. I have suggested that possibly the ultimate state of a nebula, before its condensation commences, is that of the ether itself. And, as in that case we have no gravity to effect the condensation, I have tried to show that condensation, when once initiated, would result from the vibrations of the ether itself. I confess I have not obviated the difficulty of accounting for the initiation of the phenomena, but I claim that my view of the case presents a conceivable method of dispensing with gravity as a property of matter, which, to my mind, improves the nebular hypothesis.

We have no knowledge of, nor can we conceive as possible, matter in a state of absolute rest. I assume, then, not only that matter always *was*, but that it always was in *motion*, and that every form of force is simply the manifestation of a transfer of motion from one portion of matter to another. If all the motions of the universe were consonant, as would be the case if the universe were homogeneous, the motion could by no means be recognized. Heterogeneity is therefore essential to a recognizable world. The simplest conception that I can form of a recognizable world is, therefore, an infinitely extended ether, in motion, having nucleated centers."

A NEW THERMO-ELECTRIC BATTERY.—A battery which was exhibited at a recent meeting of the French Academy, is composed of small bars of galena and of thin sheet-iron, so arranged in the form of a hollow cylinder that the heat of a gas burner introduced within may be applied to one end of all the bars. M. Becquerel read a paper on the subject, in which he expressed the opinion that such batteries, constructed either of metallic alloys or as in the specimens exhibited, of a metallic sulphide and a metal, are not economical in use; besides, they are extremely liable to detrimental change from heat.

PRIZES FOR THE DISCOVERY OF COMETS. The Imperial Academy of Sciences at Vienna has issued a circular in which, after stating that notwithstanding the wide distribution of telescopes during past years, the discoveries of new comets have been remarkably few, it proceeds to offer prizes for such discoveries during the next three years, from May 31, 1869, to May 31, 1872. There will be eight prizes yearly, consisting of a gold medal worth twenty ducats, or its value in money, as the receiver may choose. The conditions to be complied with, upon which the awards will be made, are given in the *American Journal of Science and Arts.*

DIATOMS AND THE SPECTROSCOPE.—H. L. Smith has found additional proof of the vegetable nature of the Diatomaceæ in the fact that the spectrum of *diatomin* is identical with that of *chlorophyl*, the coloring matter of plants. We give a few paragraphs from his article in *Silliman's Journal*: "The vegetable nature of the Diatomaceæ is now generally admitted, but if any further proof is needed we have it in marked results from the application of the spectroscope. I have been enabled to prove the absolute identity of *chlorophyl* or the green endochrome of plants with *diatomin* or the olive yellow endochrome of the Diatomaceæ. A very black, narrow band in the extreme red, reading at the lower edge, which appears to be constant, about ⅞ of Mr. Sorby's scale, is too characteristic to be mistaken. There are two other very faint bands, not easily seen, and somewhat more variable in position. The black band in the red is always present, and is remarkably constant in the position of its lower edge."

A New Test of Death.

M. de Parville has devised an arrangement by which an infallible answer to the question whether the subject examined is or is not dead, may be obtained. It is well known that atropiee—the active principle of belladonna—possesses the property of considerably dilating the pupil of the eye. Oculists constantly make use of it, when they want to perform an operation, or to examine the interior of the eye. Now M. le Docteur Boncbut has shown that atropine has no action on the pupil when death is real. In a state of lethargy, the pupil, under the influence of a few drops of atropine dilates in the course of a few minutes; the dilation also takes place a few instants after death; but it ceases in half an hour at the longest; consequently, the enlargement of the pupil is a certain sign that death is only apparent.

"This premised, imagine a little camera-obscura, scarcely so big as an opera-glass, containing a slip of photographic paper, which is kept unrolling for five-and-twenty or thirty minutes by means of clock-work. This apparatus, placed a short distance in front of a dead person's eye, will depict on the paper the pupil of the eye, which will have been previously moistened with a few drops of atropine. It is evident that, as the paper slides before the eye of the corpse, if the pupil dilate, its photographic image will be dilated; if, on the contrary, it remains unchanged, the image will retain its original size. An inspection of the paper then enables the experimenter to read upon it whether the death is real or apparent only. This sort of declaration can be handed to the civil officer, who will give a permit to bury, in return."

AM. ASSOC. FOR THE ADVANCEMENT OF SCIENCE.—The Salem meeting was well attended from all parts of the country. About 250 old members were present; 150 new ones were made. A list of some 150 communications is given in the *American Journal of Science and Arts*, the titles of which appeared in the daily official programmes. Some of these were read only by title at the meeting. The names of the authors are given; among them are Silliman, Wurtz, Van der Weyde, Blake, Seely, Hinrichs, Farmer, Horsford, Hunt, Newberry, Marsh, and others.

RESULTS OF THE ECLIPSE OBSERVATIONS. The *American Journal of Science and Arts* says: "There can be no doubt that materials have been collected capable of improving the adopted values of the moon's diameter and horizontal parallax. One of the most interesting results is the introduction of a new and accurate method of determining the time of first contact, by observing with a spectroscope the gradual occultation of the bright lines of the chromosphere. This we owe to Prof. Young, of Dartmouth College. By keeping the center of the slit directed to the point at which the contact is to take place, the observer is forewarned of the approach of the moon's limb by the shortening of the bright lines belonging to the chromosphere. The line C seen to grow steadily shorter until it is totally extinguished. The moment of disappearance of the last bright ray is of course that of the first contact."

DURANGITE.—Prof. George J. Brush describes, in *Silliman's Journal* for September, a new mineral sent to him for examination by Mr. Henry G. Hanks, of San Francisco. It was found in Durango, Mexico. "The crystals,"—says Prof. Brush,—"have a rhombic aspect; color, bright orange-red, almost exactly the shade of the Uralian chromate of lead; streak, cream-yellow; luster, vitreous; hardness, 5; spec. grav., 3.95—4.03. Mr. J. M. Blake makes the crystallization monoclinic." Mr. Blake adds a note to the article, in which he states that he defers a detailed account of his observations upon it in the hope that he may have an opportunity to examine other specimens. He says the figure of Keilhauite in Dana's Mineralogy, (5th ed. p. 387) is a pretty good representation of the new mineral. Prof. Brush believes it to be the only native fluo-arsenate which has been observed. He proposes for it the name *Durangite.*

Novelties on Exhibition at the Mechanics' Fair.

ENGINE SHAFT DYNAMOMETER, OR POWER MEASURER.

Mr. Sutton, of Portland, Oregon, exhibits his new dynamometer, a description of which was given in the Mining and Scientific Press several months ago. The object is to measure exactly the amount of power that is being used in a machine, for comparative purposes or for a basis of payment in letting power, a practice now so universal. Strange to say, no perfect or practical dynamometer, has hitherto been invented. A remark to this effect in the London *Engineer*, in commenting upon several devices shown at the Paris Exposition, drew Mr. Sutton on to this problem; and he thinks that the objection of working differently under different circumstances of speed, etc., made against previously invented dynamometers, has been overcome in this.

The principle employed is that of applying springs between the motor and the moved parts, with an index attached showing constantly how much compression of the springs corresponds to the requirements of the machine at work.

The method of application is as simple as the principle: two disks on a shaft, the one fast, and the other movable and attached to the pulley that drives the machine whose power is to be measured. In this manner the pulley may be said to be fast to the shaft likewise, but intermediately through the springs. A pencil, on an automatic recording contrivance, makes record of the exact amount of power exerted at every instant. Mr. Sutton estimates the cost of his power measurer at about $80, and of the automatic recorder at about $5. The dynamometer on exhibition measures up to thirteen horse-power. It is an invention of much practical importance, if it will be found in the least degree to answer its purpose. It can be fastened to any shaft, anywhere, without trouble; and expresses the power in foot-pounds (one pound raised a foot in height,) which can easily be calculated into horse-power.

SCREW BOLT WORKS.

"The San Francisco Screw Bolt Works" is another of the practical outbranchings of well-directed industry and capital in San Francisco, such as we chronicle gladly, because beneficial to the community as well as individuals. Messrs. Phelps & Co., at No. 13 and 15 Brannan street, make a specialty of manufacturing screw bolts, machine and bridge bolts, nuts, etc., the showing of which, in the machinery department, is suggestive of the immense benefit that can accrue to the country, and the encouragement to all kinds of undertakings that may be given by the opportunity to get at moderate prices, by wholesale, articles of that useful kind.

BARLEY-SAVING FEED BOX.

Horses waste, by throwing over, from one-eighth to one-quarter of the barley in the trough or box that may be placed before them. If this waste can be avoided, the saving in a few months of time will evidently amount to quite an item. A stable (full size) labelled "Whitehead and Democrat," at the Fair, accomplishes the desired point by letting the barley down, by a separate channel, back of the trough, to the bottom of the feed box, where it emerges only as fast as it is eaten away. A measuring contrivance in the conduit consists of a hollow half cylinder placed horizontally, which lets down the barley by the quart, on pulling a cord that revolves the cylinder half way round, so as to empty its contents.

GLASS BENDING.

Curious things in this line are now done for novelty in window architecture. At Mallon & Boyle's location (glass cutters, near the fountain) may also seen several very large plates of one-eighth inch thick glass, bent cylindrically, and also spherically; making great curved panes, and monster watch glasses. Bent glass in house finishing admits very pleasingly of the exercise of an artistic taste, and of much variety in the uses and effects to be had from daylight.

Boys' Steam Engines.—Two additional boy-made engines have been placed in the machinery department, viz., one by Patrick Wallace, a 3½ horse power, upright stationary engine—a fine piece of work—and another by Michael Lawton; both of the boys being apprentices at the Union Iron Works, where apprentices have been favored even to the disadvantage of the employers.

Surveyors' Instruments.—John Roach, of 540 Washington street, has brought in a splendid case of surveyors' and draughtsmans' instruments, which are worthy of examination by lovers of the exact. Past the fountain on the left hand side.

Chinese Ware.—It is said that the Chinese are inferior to the Japanese, but especially inferior to us, in the quality and tastefulness of their manufactures. The two cases of China ware in the central art gallery warrant a more favorable verdict, being equal, in that species of ware, to the best art products we have seen. The exhibitors' names (Chinese) are not placarded.

Boat Launching in Stormy Weather. The model of Capt. Edward Wakeman's boat-detaching apparatus, lately exhibited at the Merchants' Exchange, and which has been ordered for the boats in the revenue service, is placed near the photograph gallery, and will be explained this evening by the inventor himself.

Pacific Saw Manufactory.—A magnificent showing is again made by the enterprising firm of Spaulding, Sheffield & Patterson. We scarcely dare to begin on the subject of their specialty, for fear that we will fail to do justice; but the walls near the photograph gallery will better tell the tale than we can. Such an exhibition would do credit to Sheffield town itself.

Turbine at Work.—Fuller & Co. have added materially to the interest of the machinery department by putting in operation a small Bodine Jouval turbine of three inches diameter and two horse-power, in a glazed case, to be run by means of a one-inch water-pipe, under 30 pounds pressure. One of these turbines of the same size used on Water street, Boston, runs three printing presses—and this, it is expected, will be attached to some of the wood-working machines in the vicinity. A Blake's Patent Steam Pump, "No. 3," (steam engine and pump combined) exhibited by Berry & Place, furnishes the water and pressure.

Kindleberger & Arnold's Inventions. Machinery can be made to do anything. Mention an article in demand, the use of which, at a small price, is a public desideratum, and you will not need even to express the wish for a machine—almost before you conceive of the necessity for it an inventor will walk into the Mechanics' Institute Fair with a model under his arm, or a working device to do the thing by wholesale. We could cite no better illustration of the limitless capacity of invention than will be afforded by a few minutes observation of Messrs. K. & A's several machines,—to make blind slats, and to wire them, and his double door hinge. See how complicated the work is, and how easily and quickly it is done; the consequence, that window blinds, a thing of comfort, are cheap, and the inventor himself profits largely by the operation, as well as the public whose wants are served.

"Mother," said Ike Partington, "did you know that the 'iron horse' had but one ear?" "One ear! merciful gracious, child, what do you mean?" "Why, the engineer, of course."

Improved Projectile.

We give herewith a pictorial representation of an improved projectile, the invention of Mr. A. F. Potter, of Oakland. This projectile accomplishes, perfectly, what no other one in use can do—it causes the ball to travel and strike the mark, point first. These projectiles are intended to be fired from smooth-bores; the spiral flange attached to the ball giving it the desired rotary motion, which greatly aids its penetrating power and accuracy. Contrary to what might at first be supposed, its flight is accomplished with less resistance from the air than either the ordinary or minnie bullet; this is proven by its noiseless flight, while all other projectiles are accompanied with more or less hissing sound, due to the friction, and of course, resistance of the atmosphere.

Mr. Potter invented a two-flanged projectile in the second year of the war of rebellion, and generously tendered the same through the then Secretary of War, to the United States Government. Experiments were made with it, under the direction of the War Department, which were not entirely satisfactory. The inventor afterwards added another flange, which be found accomplished the desired object perfectly—that of lighting the projectile upon its point, which the inventor claims will be the case in 99 out of any 100 trials. This projectile renders a smooth-bore equally as effective as a rifled barrel. The patent for this invention was secured through the Mining and Scientific Press Patent Agency.

A Woman's Invention.—Yesterday a little machine was placed on exhibition near the Mining Press stand, and last evening it was put in motion to illustrate the principle on which it works and the use for which it is designed. It is the invention of a young lady of this city, Mary P. Carpenter, and is an improved fluting machine. The construction is exceedingly simple. First, there is a small cast iron heater, like the body of a miniature stove. Through this at one end run two cylindrical shafts of composition metal, copper preponderating. Outside of the heater is a surrounding case of tin and wood, the tin lining to protect the outer case of wood, which being a non-conductor of heat, protects the fabric on one side and the hand on the other. The metal shafts extend through, and on one end is adjusted the crank, and the opposite end the corrugated fluting cylinders, the grooves of which mash like cogs. These may be changed to suit the style of work—for fine or coarse fluting. The border to be fluted is passed between the cylinders by turning the crank. The cylinders may be heated in three minutes with a gas jet, or with charcoal, and will retain their heat a long time. The inventor has applied for a patent.—*Bulletin, Wednesday, Sept. 22d.*

New Incorporations.

S. F. Laundry Asso'n.—Increase of capital stock to the sum of $25,000; to be divided into 250 shares.

Ancient River Bed Gravel M. Co.—Black Oak Mining District, Placer County. Sept. 21st. Capital stock, $150,000, divided into 15,000 shares. Trustees: W. S. Manning, Peter W. Randle, W. W. Lawton, H. H. Blake and G. C. Lake.

New Era G. & S. M. Co.—Sept. 24th. Trustees: S. F. Reynolds (President), Jas. Battersby (Vice President), Albert Shepard, J. C. Toady, R. A. Robinson and C. H. Chamberlain. Secretary and Treasurer, D. McLaren.

Cosala S. M. Co.—Sept. 21st. Trustees: J. Mora Moss, John Wright, Charles Meinecke, W. W. Arey, and Charles Baum (Secretary.

Recent Patents.

Ore Crushing Mill.—J. Harvey Day, Walla, W. T. The above named invention contemplates the construction of a mill for crushing rock or quartz, which can be operated at a small expense of power, and at the same time perform very effective work. It consists of a series of disks mounted one upon another in a peculiar manner, each disk having a crushing surface on its lower rim. These disks form a pile, and are united to each other by universal joints, so that they can be made to drop on either side, and thus bring the crushing shoe into the track below. The whole pile is surmounted by a heavy weight, which is also connected to the upper disk by a universal joint, and has a grinding surface at its lower outside edge. The weight and the plates or disks are so set that when standing vertically there will be a space between each pair of grinding surfaces; but when inclined to one side the grinding or crushing face of the weight will rest on any one that may be in the track. Motion being given to the weight, it will revolve about a vertical line through the center of the base, and thus cause all the crushing surfaces to come successively together.

Wheel for Vehicles.—Timothy R. Smith, San Francisco, Cal. Inventors have long tried to construct some kind of wheel which would overcome the objections to the ordinary wooden one. The wooden wheel does very well in the city, where a blacksmith's or wagon-maker's shop can be found when wanted; but when they are employed on long journeys, especially during the summer, they soon shrink and fall to pieces, and where no "physician" can be found to mend matters. Mr. Smith claims that he has invented a wheel which will not be subject to any of these difficulties. The wheel is made entirely of iron. The hub is formed of a number of segments and rings, having rubber washers and packing between them. The spokes are hollow (he prefers gas-pipe), and are inserted two between each two segments of the hub, when the segments are firmly bound together by bolts and nuts. The felloe is also of iron. The rubber packing in the hub breaks the concussions to which the wheel is subjected. The weight of the wheel will be no greater than that of the ordinary wheel, while its strength is far greater.

Mail Bag.—Zara T. Sweet, Davisville, Cal. This invention relates to the manner of fastening the mouth of the bag, and it consists in inserting a wire, formed into the shape of an ellipse, around the upper or open end of the bag. A cover is also made in the form of an ellipse, and has a groove passing entirely around its edge. When it is desired to close the bag, the cover is placed so that the wire will lie in the groove, and the two ends of the wire are drawn strongly together and secured by a padlock, thus effectually closing it. When the cover is removed, the bag is suspended by strings, or other convenient device, which is secured to the encircling wire, thus giving a convenient mouth into which the mail or express matter can be thrown. Mr. Sweet, the inventor of this device, is also the patentee of several other promising inventions.

Iron Smelting.—Hanscom & Co., of the Ætna Iron Works, are putting up a cupola furnace to smelt and cast Oregon iron into building ornaments. An opportunity is here offered to witness the principles of smelting in application. The blower to be used is a No. 5 Root's rotary, sent to the Fair by Keep & Bargion, of Stockton. On Saturday evening, between 8 and 9 o'clock, the first castings will be made.

A Social Glass to which Ladies are addicted—The mirror.

Stock Review.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, September 25, 1869.

Financial.

Telegraphic dispatches received yesterday from New York, convey the unpleasant information that gold gambling is being carried on with increased fervency. Yesterday gold jumped to 135¾ in New York. At 1 o'clock it dropped to 135, and at 3 o'clock to 133⅞. At the same time, sterling exchange changed from 108¾ to 108⅝, which will have the effect of sending European gold across the Atlantic to realize the high premium obtainable in New York. It is also affirmed that Erie Railroad stock suffered a decline of 20 per cent. yesterday, showing a decided panic in the stock market. Unfortunately for us, the feverish and unhealthy condition of New York finances exerts a pernicious effect upon all our business relations. Heavy capitalists, who are well supplied with coin and bullion, transfer it to New York by telegraph, to realize the premium, producing a scarcity here, and seriously crippling our local requirements. The stringency so caused raises the rate of interest here, and the transferred gold, having done its work in New York, is again reproduced in this market, to benefit by such advance in rates. That such a condition of affairs should exist at the time when we are marketing our heavy grain crops is especially to be deplored. In a short time the tax collector will make his annual collections, absorbing large amounts of our coin. On the other hand, payments made to the interior for domestic produce will commence to gravitate toward the commercial center, and demands for duties will begin to diminish. In the meantime, a spirit of greater economy obtains among the masses, caused by the monetary stringency which has existed for some time past. In November, the Treasury will let loose large amounts of gold, in the shape of interest, tending to give greater ease to the market. Our merchants do not find themselves laboring under a scarcity of money, although it is not as plentiful as might be wished, and rates have undergone no change from our last quotations. We learn of little stringency, and this fact is the best evidence of a wholesome financial condition, in view of the desperate struggle going on in Wall street.

The exports of Treasure from Sept. 1st to date have been as follows:

Sept. 4—Per Japan—		
To China	$316,218 04	
To Japan	24,878 00	
		$341,096 04
Sept. 1 to 9—Overland to New York		530,511 34
Sept. 14—Per Colorado—		
To England	$449,670 02	
To France	177,304 18	
To Central America	11,940 00	
To Panama	20,000 00	
		658,914 20
Sept. 10 to 15—Overland to New York		477,500 00
Sept. 17—Per Speedwell to La Union		10,000 00
Sept. 16 to 20—Overland to New York		519,577 51
Total since September 1st, 1869		$2,946,599 09
Previously this year		25,999,830 42
Total since January 1st, 1869		$28,946,429 51
Corresponding period, 1868		21,894,905 84
Increase this year		$1,052,523 67

The duties paid at the Custom House in this city from September 17th to date have been as follows:

September 17	$41,235 44
September 18	30,857 14
September 20	18,201 08
September 21	26,782 64
September 22	53,690 28
September 23	30,771 21
Previously in September	402,449 59
In September to date	$663,677 38
In August	769,589 56
In July	942,814 71
In June	675,051 81
In May	595,030 24
In April	554,882 05
In March	789,447 40
In February	602,349 01
In January	532,997 97
Total since January 1st, 1869	$6,116,831 12
Corresponding period, 1868	6,344,034 76
Decrease this year	$227,203 64

In this market Legal Tenders—at 10 o'clock yesterday morning—ruled at five or six per cent. above the rate of gold in New York, offering to sell at 71@72, and buy at 70. In view of this sudden rise, it is difficult to obtain exchange on Atlantic cities. At the close, Legal Tenders rose to 75.

Money was in active request in all the Eastern markets at date of our latest mail advices. Rates raised, according to the character of the borrowers, from 6 to 10 per cent. for call loans; the former figure being paid on Government securities; but the medium of 7 to 8 per cent. generally obtained. We learn that Mr. Boutwell has instructed the several Assistant Treasurers to withhold from circulation all ten-dollar greenbacks now held or which may be retired in future, until the whole issue of $90,000,000 has been returned. This is done because of the extensive forgeries of this denomination. Although nothing is said about the new issue, it is probable that the old notes will be immediately replaced by new ones as fast as retired, so as not to cripple the movement of Western grain and Southern cotton crops, as the demand for bills of this denomination is very large for those purposes. Some difficulty is experienced in making time loans, as a general belief obtains that money will be scarce and the market stringent by the middle of October. We have patiently searched for some good reason for this impression, but find no sufficient grounds outside the fickle and unreliable character of Wall and Broad-street speculations.

City Stocks.

Dullness pervades the stock market in every department. The sales consummated are very light. San Francisco Gas stock was disposed of at $82 50, and Spring Valley Water at $63@63 25 per share.

The returns of our local insurance companies to the Internal Revenue Department for the month of August and previously this year have been as follows, upon a currency basis of 74 cents on the dollar for the month of January, 77¼ cents for February and March, 75¾ cents for April, 73¾ cents for May, 74½ cents for June and July, and 74 cents for August.

	August.	Previously this year.	Total.
Pacific	$121,184	$241,215	$362,401
Union	35,329	267,891	303,220
Fireman's Fund	36,714	237,360	274,074
California	8,305	71,981	80,286
Merchants' Mutual Marine	22,546	179,640	202,186
Occidental	23,909	162,789	186,698
Home Mutual	15,731	98,235	114,166
Peoples'	20,513	122,332	142,845
Total	$286,901	$1,910,955	$2,197,856
Same time in 1868	222,311	1,192,075	1,414,386
Increase in 1869	$64,590	$718,880	$783,470

The above statement shows a falling off of $13,367 from the receipts in July. The receipts of the several companies in August as compared with July show the following difference:

	Increase.	Decrease.
Pacific	.....	$3,752
Union	.....	2,280
Fireman's Fund	.....	1,090
California	.....	987
Merchants' Mutual Marine	$1,642	.....
Occidental	.....	2,978
Home Mutual	.....	84
People's	.....	3,868

The receipts of the city railroads for the month of August and previously this year were as follows:

	August.	Previously this year.	Total.
Omnibus	$24,864	$172,050	$196,914
North Beach & Mission	25,836	166,321	192,206
Central	17,950	115,886	133,836
Front Street, Mission & Ocean	9,538	65,028	74,566
Market Street	12,650	82,559	94,609
Potrero and Bay View	3,202	21,574	24,776
City	4,566	3,308	7,874
Totals	$98,126	$626,729	$724,855
Same time in 1868	96,645	558,193	654,838
Increase in 1869	$1,481	$68,536	$70,017

As compared with the total receipts in July, we find a decrease of $3,283. The receipts of August as against July show the following difference:

	Increase.	Decrease.
Omnibus	.....	$1,206
North Beach and Mission	.....	75
Central	.....	936
Front Street, Mission and Ocean	.....	1,169
Market Street	.....	522
Potrero and Bay View	.....	543
City	$1,238	.....

Mining Share Market.

During the past week the mining share market has not gained any activity as compared with the previous week. The line of stocks dealt in has been confined to a less number of claims, and the general business has resulted in a considerable depression in nearly all the stocks offered. With regard to the present condition of the mines our information is meagre, and does not show that important developments have recently been made; however, persistency characterizes operations to a marked extent, and the prospectore pursue their work with unflagging energy.

CHOLLAR-POTOSI—was in the market to a considerable extent. For the week ending Sept. 17th, 967 tons of ore were mined, and 1,188 sent to custom mills. Of this amount the Blue Wing stope yielded 730, New Tunnel 165, and Grass Valley 72 tons. The sill floor of the New Tunnel, in the north drift, continues to yield a good quality of ore, and has not changed much in general appearance during the past seven days. On the 18th floor the drift running north is in quartz, with some ore, and looks very favorably for finding a good body of ore. On the 20th they sent 154½ tons of ore to four custom mills.

HALE & NORCROSS—under about the usual sales, dropped considerably during the period under review. During the week ending Sept. 18th the upper mine produced 381, and the lower mine 627, making a total of 1,008 tons. In the same time they delivered 820½ tons, leaving on hand 2,086 tons. The sinking of the main shaft is progressing favorably. In the fifth level the breasts in the south stope are reported to look exceedingly well, the pay ore having a width of from 12 to 17 feet in this raise. A drift 35 feet above this stope is now 12 feet south of the raise, average assays of ore found here showing $96 to the ton. The breasts in the north body in this level look well, and are unchanged. The west drift from the fifth floor of this level is now in the vein 17 feet, but has not yet reached its western wall. The assays from this ore vary from $34 to $186 per ton. This is evidently the vein the Savage Company has been working for years.

GOULD & CURRY—sold to a limited extent, at a smart decline. During the week ending Sept. 20th they mined 272 tons, and shipped 339 tons for reduction. During the same time 12 feet have been added to the north drift running south from the 7th station, and 15 feet to the south drift. So far during the current month bullion to the amount of $23,693 has been received.—OPHIR, also, shows a considerable fall. The drift was 606 feet in length on the 21st inst.

We clip the following from the White Pine *News*, with reference to White Pine stocks:

AURORA CONSOLIDATED—still continues shipping 40 to 60 tons per day to mill from the Earl mine. The Ward Beecher mine, belonging to this company, has been leased, and will also be constantly shipping ore. The Last Chance, another of its mines, has recently been started up, and is yielding ore of good quality for reduction. This company is working with unusual energy, employing a large force of men, and meeting with the success it deserves.—CALIFORNIA has not yet put on a full force, but will do so in a few days. Only four men at work at present. There are over 1,000 tons of ore on the dumps awaiting the completion of the Stanford mill.—CONSOLIDATED CHLORIDE FLAT continues, with its force of 125 men, to send about 50 tons per day to mill for reduction.—EBERHARDT is still working with a force of 25 or 30 men, and taking out a large quantity of excellent ore.—The suit of the Hidden Treasure *vs.* Rathburn has suddenly terminated by the plaintiff's withdrawing a juror.

CHILLED DIES.—G. W. Coffey, of the Risdon Iron Works, exhibits very large "internally and externally double-chilled battery shoes and dies," which are not handsome to look at, but are said to be a great improvement upon the ordinary ones in their wearing quality.

THERE is a law in Delaware which requires a husband to give bonds in $200 to keep the peace. They appear to have a clear conception of the marriage contract in that State.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Sept. 24, 1869.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

	Per ton.				Per ton
12 per cent. ore	$24 00	18 per cent. ore			$41 40
13 " "	26 65	19 " "			44 65
14 " "	29 40	20 " "			48 00
15 " "	32 25	25 " "			62 50
16 " "	35 20	30 " "			75 60
17 " "	38 25				

Ores assaying above 30 per cent., $2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

These prices, corrected by W. T. Atwood, we believe will be found substantially correct, and can be realized at this date.

A DETROIT lad, aged thirteen, who has been reading dime novels very much, of late, accoutered himself with a rusty shotgun and a satchel of provisions, the other day, and started for the woods, where he proposed to hunt and fish for a living, after the manner of the ten cent heroes. He was taken into the woodshed and whipped.

THE St. Louis papers have got a first-class sensation. An injured husband sues a rich merchant for seducing his wife.

To Remove Stains from your Character—Get rich.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

The Leviathan.—*Chronicle*, Sept. 11th: On Thursday this mine was examined by W. T. Rickard, for an English company interested. He does not hesitate to pronounce it one of the richest copper mines in the world. One hundred tons of the No. 1 ore—50 to 60 per cent. copper—will be shipped to England immediately by way of San Francisco, and the lower grades will be smelted at the mine. Works capable of reducing 6 tons per day will be immediately erected.

BUTTE COUNTY.

Taking out the Dust.—*Record*, 18th: Reports from Russ Johnson & Co., who have a large flume in the North Fork, represent them as taking out the dust with a seventy Chinamen power. This is the fifth year that Mr. Johnson has tried the North Fork. It is said they are finding very rich deposits.

CALAVERAS COUNTY.

Quartz.—*Chronicle*, 18th: The surface from the claim of Hadlock & Co., crushed in Smith's mill, yielded eight and a half dollars per ton. We understand that it is the intention of the proprietors to thoroughly prospect the vein.

INYO COUNTY.

Cerro Gordo.—Los Angeles *News*, 18th: A private letter says: Mr. Woodworth, of San Francisco, now proprietor of the San Ignacio mine, is extracting very rich ore. There is also a German physician who recently bought the San Felipe mine for five thousand dollars. This gentleman has begun work on said mine with the most flattering prospects.

Belshaw is doing a fine business with his furnace and machinery. Mr. Schmidt commenced smelting last week for a new company styled the Cerro Gordo Smelting Company. The mills of Col. Stevenson and Cervantes & Co., are also in active operation. From facts before us, and the energy displayed on every side, there can be no doubt of the greatest success and the fulfillment of our brightest hopes.

NEVADA COUNTY.

Omega.—*Transcript*, 15th: The Prescott claims have been worked this season by Geo. W. Kidd & Co., and first rate results obtained. We saw yesterday two bars, worth $12,500, the result of the last washing. The gold from Omega is of extreme fineness, assaying $20 to the ounce. A partial clean up made before the last, yielded $3,200, making a total of $15,700.

More Mining.—Same of 16th: The success of Ole Allen, in demonstrating the existence of a channel in the Kansas ground, has attracted the attention of other parties, and a company has been organized in San Francisco, which will, in a few weeks, commence operations in the adjoining claims. The opening of that channel will give employment to a number of men and yield a large amount of bullion. The signs of the times for this locality are getting brighter every day.

Struck Gravel.—Same of 17th: The San José Co., which has been prospecting in the ground adjoining Maltman & Marselus' claims, on Wednesday raised and struck a bed of gravel, which has every indication of being good pay dirt.

Mining Items.—18th: Forty tons of excellent rock from Mount Auburn ledge, will be crushed at Murchie's mill. The ledge is three feet thick, and the rock of first grade. The first crushing paid $32 per ton. In the claim adjoining, the parties have fine prospects, and the Vigilance mine,—as it was called,—since capital has been invested in its development, promises well. One of the new style mills, in which the stem acts directly upon the stamp, is to be erected.

Eureka.—*Gazette*, 16th: We learn that times are lively in Eureka District. The Bloomfield Gravel Co. have a large force engaged on their ditch, and quartz operations are carried on energetically. Mr. Stewart is working the Mohawk and Dillon mines, owned by parties in San Francisco. The Mohawk is five feet in width, and a crushing of 50 tons recently made, yielded over $600. The Dillon is smaller, but the rock pays better. Both will be worked steadily, and the owners purpose erecting a mill next spring. Andrew Veatch is working the Erie mine, two miles this side of Graniteville, and having the rock crushed at the Black and Young mill. The mine of the Mutual Co.—formerly the Jim—is now paying well. All the mills that are in condition for working, are running most of the time, and prospects generally are favorable.

McClellan Ledge.—Same of 7th: The McClellan ledge is being opened in a thorough manner. The incline is down 70 ft., the ledge abounds in sulphurets, and is 2½ ft. thick. The company own 1,500 ft. of ground, and shares are sold at $6 a foot.

Steep Hollow.—Same of 18th: The gravel claims opened by White, Coe and others, continue to yield well, and rich nuggets are being taken out nearly every day. On Monday one of the miners picked out a lump of pure gold worth $42.50. The company have a tunnel extending across the gravel channel, the latter being 200 ft. wide on the bottom. The pay streak of gravel lies on the bedrock, and is two feet thick.

The *Gazette* says: "Now that a start has been made in opening the gravel claims on the continuation of the Nebraska lead, we may expect a return of something like the old times for Nevada. With the knowledge now acquired of the course of the lead, enterprises can be undertaken with little risk. It is reported that a company has been organized to open another claim near the Kansas, and arrangements may be effected this fall for resuming operations on the Harmony ground, and also for opening the ground of the Cold Spring Co., still further up the ridge."

Wm. Penn Mine.—Grass Valley *National*, Sept. 20th: The owners of this mine are putting up a 25-horse power engine and a 6-inch pump. Their shaft is down 164 ft. on the ledge, which is looking well, and is from 2½ to 3 ft. in thickness. They will commence sinking next week.

PLUMAS COUNTY.

Rich Quartz.—Quincy *National*, 11th: We were shown this week some very rich quartz from a ledge four miles from this place, opened a few weeks ago. It was located for a San Francisco company, who would to-day have a mill running had it not been for certain misrepresentations. Some of the rock paid, by mortar, upwards of $10 a pound. A tunnel is about being run along the lode.

SAN BERNARDINO COUNTY.

New Gold Diggings.—*Guardian*, 11th: Our little burg was considerably excrcised on Tuesday, by the report of rich gold diggings in the vicinity of Lytle Creek. Some 40 or 50 persons have left town for the new places. All sorts of rumors are afloat. We learn that the placers are between the headwaters of the San Gabriel and Colorado.

SIERRA COUNTY.

Brush Creek Mine.—*Messenger*, 18th: We paid a visit to the Brush Creek mine and mill on Saturday, and think it is one of the most complete establishments that have ever fallen under our notice. The mill building is a most substantial structure, 40 by 90 ft. in the clear, with a wing, or L, 20 by 40 ft., in which are the engine and boiler. The mill has power for twenty stamps, though at present running only 10. It has two Knox pans and a Payne & Stevens patent Buddle. The machinery is driven by a 50-horse power engine, The shaft is 300 ft. deep. In the year past, there has been taken out and crushed 3,380 tons of quartz, which has yielded for the year's run of 52 weeks, a total of $105,845.04, or an average of $31.31 per ton.

SISKIYOU COUNTY.

Scott Valley.—Correspondent of Yreka *Union*, 18th: Fred. Turk has discovered a quartz ledge which promises to be one of the richest in the county. I saw 1¼ lbs. of rock crushed in a mortar which yielded 50 cents. Mr. Turk says he can make on an average $5 a day with a hand mortar. The ledge is near Mugginsville.

Smith, Hand & Co. have discovered a ledge at the head of Smith's Gulch, that is three ft. wide, with good casings, and prospects very rich. The boys have named it the Banner ledge.

TRINITY COUNTY.

Indian Creek.—*Journal*, 18th: On the right hand bank Sigfried & Warfield, and Jonathan Smith & Co. are cleaning bedrock. Their claims are supplied with water from Stratton's ditch and have paid well. Coombs & Silcox are reöpening their claim, employing five or six hands. On the hill above town, and above any of the ditches, Thos. Bochran has struck good drifting dirt, which is dumped through a slide below the ditch before it can be washed. With these exceptions, the creek is worked by Portuguese miners.

On Spring Gulch, Tim Hennessey and Martin Keefe have a good claim in the bank. The past had been a bad season for water in all the dry diggings, but these boys have done very well, though their claim is a heavy one to work.

YUBA COUNTY.

Nelson Point.—*Appeal*, Sept. 18th: Johnson & Co. have got into the river, and have averaged $8 per day to the hand. Wormley, Kohr & Co. have abandoned their claim on Nelson and opened out in the river, just below Johnson, and are getting good prospects—five cents to the pan in the gravel. Ed. Field and Stevens, on Nelson Creek, lost the bedrock, but they are getting some pay again. Ellerman & Co. are making $5 per day to the man. Miller & Co., on Dickson Creek, are making wages. Hill & Co., lower down the creek, have good prospects, but have not washed up this season. Oliver & McGuire will get down in their wing-dam this week. Heath & Co., of Argentine, are doing well piping talcose slate; they say they are making from $16 to $25 per day to the hand; they have sunk a shaft 60 ft. in this slate and got as good prospects at the bottom as top. Chris. Beck, on Squirrel Creek, near the last named place, has good prospects, and is digging ditch to convey water to his diggings.

Arizona.

The Sterling.—Prescott *Miner*, Sept. 4th: Work is progressing favorably. Three shifts of hands are taking out ore, of which there is an abundance. After a thorough test of the machinery, the mill was shut down, there being no water to run it. It is the intention to keep on taking out ore.

The Paul & Wood Process.—Noyes & Lount are satisfied that they have mastered this process, and, by it, can work all sorts of rebellious ores. Recently, Mr. Noyes informs us, 500 pounds of Sterling tailings yielded an ounce and a half of gold. The rock, of which they were the debris, had been worked carefully in an arastra. The next test will be made on raw ore.

Good Sized Pieces.—Tom Whitehead, a youthful miner of Upper Hassayampa, showed us three pieces of gold, out of his placer claim on the Hassayampa, below the Chase mill, which weighed, respectively, $13.50, $7, and $4. He corralled them all in one day, with a rocker, and several dollars' worth of fine gold. Owing to the scarcity of water, but little mining is being done on the creek, but that little, it appears, pays well. Two men at work on a bar near Tom's claim are making from $5 to $6 per day.

Vulture.—Francis Hinton has become possessed of 1,400 feet on the Vulture lode; also, of the Wickenburg ten-stamp mill. At latest dates from Wickenburg, the ore was paying well.

Idaho.

Bedrock Shaft.—Idaho City *World*, Sept. 9th: This work is progressing, and a depth of 110 ft. has been reached. We visited the scene on Tuesday, and found that the water was being hailed out at the rate of 1,800 gallons per hour with the large bucket alone. The elevating apparatus had become temporarily disabled. When both the bucket and elevator are at work, the miners have no trouble in keeping the shaft clear of water.

Placerville.—Mr. Wm. Lynch, President of the Gold Hill Quartz Co., which bought the 25-stamp mill of Mr. Classen informs us that they started the mill, running 20 stamps, on Monday, and will make a run of two weeks before cleaning up. They have about 600 tons of rock from the Gold Hill ledge on the dump.

The Loon Creek Diggings.—Correspondent of Boise City *Statesman*, Sept. 14th: Varney & Co's clean up for three days past has been, 1st, $153; 2d, $170; and yesterday estimated at $120. Some fine specimens, weighing from $3 to $5, have been taken up each day. There are five men at work in this claim. There are three companies above this one joining each other, and from what I can learn they are taking out from $30 to $40 per day to the hand. In a week or ten days there will be some 20 or 30 sluices running. That there will be three or four miles of good creek mining is no longer doubtful.

Another letter in the *Statesman* of the 16th, says; A party prospecting on Trail Creek five miles from here, yesterday reported 25 cents to the pan; and last night the camp was alive with wild rumors of the new discovery. Three miles from town, up the stream, Loon Creek divides itself into three branches; Trail Creek is the right hand fork; the Middle Fork, which is the longest, and the Left Hand Fork, which heads northeast. A party just returned from the latter, report $8 and $10 diggings. I conversed with one, and he said that the ground would pay half an ounce a day to the hand. The prospects in the vicinity of town are flattering. Reports from the claim where the creek has been flumed in the cañon, state that the company cleaned up on Friday and Saturday $600 each day. I am informed by one of the men at work in the Craig claim that they have taken out the past week $40 per day to the hand. Of the five or six claims opposite town now at work, I am safe in saying that they average $20 per day to the hand. On the whole, I conclude that there is plenty of work for more men than are now in the camp, at good wages.

The *World* says: During the past week several parties have returned from the new diggings. They bring no additional news except that two companies are at work in the river, and the claims are said to pay about $8 per day to the hand. Other companies are opening claims, but the indications are that no great amount of work will be done this fall. From all we can gather, we are satisfied that the new diggings, though having some rich spots, will not prove extensive enough to give employment to more than 300 or 400 persons. Mr. Jas. Armstrong, one of the original discoverers, passed through this place a few days since, on his way to Boise City, having sold out his interest for $2,500. The majority of those who have returned here seem to have no intention of going back again this fall.

Montana.

[Owing to the pressure upon our columns, we are compelled this week to omit our summary of mining news from Colorado and Montana. A communication from the last-named Territory will be found in another column.—Eds. Press.]

Nevada.

COPE DISTRICT.

Mountain City.—Correspondent Elko *Independent*, 18th: Lytle & Co. are cutting a ditch to supply the placer mines with water; it will cost $10,000. At present, but little can be done at placer mining. Some few miners are packing dirt to the river, and are making good wages. The dust assays $12 per ounce. In quartz, Drew, Cutter & Co. have run two tunnels for the Buckeye ledge, one of 150 ft., and the other 60 ft. In the former an abundance of good ore has been disclosed, averaging $250 per ton in silver, and from $25 to $75 per ton in gold. To-day, an offer was made of $20 per foot, in cash, for 900 ft. in the Mountain City ledge, which was refused. There are 1,600 ft. in the discovery claim. From Maj. Drew I learn that a 10-stamp mill, with all the modern improvements, has been purchased in San Francisco to work the Argenta mine.

REESE RIVER.

Cortez District.—*Reveille*, 14th: We are informed by Mr. S. O. Clifford, from Cortez District, that more activity prevails than for several years. There are 100 men in the district. Mr. Clifford is one of the owners of a mine called Magenta, which is yielding extraordinary ore. Wenhan & Co. own the only quartz mill in the district. The mill charges $40 per ton for reducing custom ore.

The copper of Cortez is likely to prove, if reports be true, as valuable as that of Battle Mountain. Its ores may be hauled to the railroad over a good road 25 miles in length.

Morey District.—Same of 13th: Mr. Ogden is employing Chinese miners. The mines of the company will soon yield large quantities of ore for milling. Some four tons, the first fruits of Chinese labor, were shipped for reduction at the Hamilton mill in this city.

Spring Valley District.—13th: This district, 70 miles southeast from Austin, was organized in July. It is estimated that about 50 claims will yield milling ore at the surface. We have seen a specimen from the Murray, a massive piece of compact ore weighing 124 lbs., all over which could be seen horn silver and the purplish black stetefeldtite—the latter mineral being the chief bearer of silver in the southeastern part of the State. The same of 17th says: Three tons of ore from Spring Valley has arrived here for reduction at the Manhattan mill. It is from the Mayott claim. One and a half tons from the Reeves and Berry, worked at that mill $667 per ton. The Providence ledge is said to be 60 ft. wide.

Mineral Hill.—Same of 17th: Yesterday 7½ tons of Mineral Hill ore were hauled to the Manhattan mill, which makes 12 tons now in this city. The ore was produced by several claims and is known to be uncommonly good, as the former workings gave a yield of $600 to $800 per ton. Prospectors in the district say there is no lean ore there.

Rich.—We mentioned on Wednesday an assay of pulp of ore produced by a mine near the Chase in the Yankee Blade section, the rate of which was $1,108 per ton. The

rich batch was small, however. Since it was worked tho owners of tho mine have sent 10 tons of what they call seeond class ore to tho mill, the yield of which averaged $320 per ton. Ton tons of orc—which were extracted in a few days by a few miners—produced nearly $3,000.

AUSTIN IMPROVING.—Claims on Lauder Hill, long deserted, are now yielding rich chloride ores. Our businesemen and owners of property have recovered from tho temporary panie into which they were thrown hy tho changos caused hy the railroad, and appear to be contented with the prospects of Austin. Wo think their heads are level.

The *Rereille*, which npon the outbreak of White Pine, contracted into a weekly, has resumed its daily issue.

BULLION PRODUCED.—*Rereille*, 18th: During tho week ending this date, liullion was produced in this city as follows: Manhattan mill, 12,456 ozs.; Mettacom mill, 5,800 ozs.

WASHOE.

[In tho Stock Circular, in another portion of this paper will be found late mining news from this district.]

OPHIR.—*Enterprise*, 19th: The drift to the west from the hottom of the main shaft is now in 600 feet. It is thought that 200 feet farther will carry it through the ledgo aud into the west country rock. Tho company are now putting in an air-pump. They have already in position a Root's patent hlower, of a larger size than any one yet iu use on the Comstock range.

GOULD & CURRY.—The Bonner shaft is now down 1,185 feet. At tho depth of 1,160 feet a drift has been run to the westward 75 feet, without finding anything of value. Last Thursday a Root's blower was started, which now supplies fresh air to tho secoud etation, and will eventually supply air to the lower or seventh station. Ahout 30 tons per day of ore worth $50 per ton is being extracted.

SAVAGE.—The mine is yielding 80 tons of ore per day. The main shaft is heing sunk 100 feet deeper for the purpose of opening a new level. New steel wire cables are also heing put in.

HALE & NORCNOSS.—This company are sinking for a new level, which will be opened at a depth of 1,100 feet helow tho surface. They have a fine deposit of ore in their present lower level, with much good ore in sight in other parts of the mine. They are using Elko coal instead of wood, as an experiment.

CHOLLAR-POTOSI.—Yielding 175 tons of ore per day. Fine ore has heen found in the "New Tunnel."

OCCIDENTAL.—Lower tunnel is progressing rapidly. Rock is easily picked down. Bunches of ore that assay well occasionally found.

YELLOW JACKET.—About 180 tons of ore per day are heing raised from the south shaft. The north ehaft has not yet heen cleared of mud and water, but it is said that thoy will get down to the 700-foot level in ahout a week.

VIRGINIA CONSOLIDATED.—Shaft down 300 feet. Rock hard. What water there is, comes up in the tubs with the dirt.

OVERMAN is yielding 23 tons daily.

LADY BRYAN.—Gold Hill *News*, 18th: Hereafter the capital will he $2,700,000, divided into 18,000 shares of $150 each, against the old capital of $1,800,000, divided into 6,000 shares of $3,000 each.

SIERRA NEVADA.—Virginia Cor. S. F. *Herald*, 19th: The Sierra Nevada is getting aloug finely, hoth mine and mill always working at a very regular, eteady-going, hullion-producing rate. Tho first clean-up for the preeent month was made last Thursday, and was, if anything, a little hetter than the average. The state of the mine remaine ahout the eame, except that the hody of ore recently developed in the car-track tunnel improves.

WHITE PINE.

WEEKLY MINING REVIEW.—*News*, Sept. 18th: The regular routino of work is progressing in our principal mines; the mills are all kept busy, and large quantities of oro are accumulating on the dumps, hesides. The principal mines are employing all the men they eau work to advantage. There are fewer idle men on our streets than at any former time. Attention is heing attracted to the Base Range, as inviting profitable investments in the erection of small furnaces, at an expense of only one or two hundred dollars, somewhat on the Moxican plan. Several of these simple smeltiug works have heeu put iu operation, with satisfactory results. Already the weekly product of our smelting works is quite respectable, though we are unable to give the amount.

LEAD BULLION.—*Empire*, 18th: Creighton'e agent at Elko furnishes the following statement of argentiferous lead received at their office the present month, for shipment helow: Total number of hars, 198, weighing 19,375 ponnds. At the dato the foregoing statement was mado there were 35,102 pounds on the road between this city and Elko. The entire amount was shipped from the White Pine Smelting Works, at Swansea, and consigued to D. D. Shattuck, Sau Francisco.

HIDDEN TREASURE AND RATHBURN.—The suit of the former against the latter came to a eudden termination on the 17th, by withdrawal of a juror. The Rathburn immediately commenced a suit of a similar character on its owu account against the former.

ITEMS.—*News*, 18th: Tho Monteze mine, Argyle Hill, is likely to provo an excellent property. The ledge is apparently 25 or 30 feet wido. A drift now being run aeross it has attained a length of 20 feet, all the way in good ore. Wo were shown a small bar of the value of $5.13, the product of 80 pounds of average ore....A 20-stamp mill is huilding in Chicago for J. W. Wadleigh, to be erected in the vicinity of the California mine. It is to be shipped in timo to he crected this fall....*Empire*, 15th: There is not less than $2,000,000 worth of oro awaiting reduction on the various dumps throughout the district....James Shields has taken a contract to extract several thousand tons of ore from the Ward Beecher mine. It will take until next June....In the Eherhardt, which we visited the other day, good ore is brought to light wherever a pick is struck iu the ground; and instead of the miuo heing worked out, or heing unahle to yield ore worth $15 per ton, we do not believe a ton of ore can he taken from the poorest place in the mine where it has been opened, which will not yield at least douhle that amount, and tons of that character would be more difficult to fiud than tons would which will give a yield of $6,000 per ton. We saw the mine in nearly the same condition as on our last visit. When you are down in it you can eee nothing but huge masses of chloride and horn silver on all sides....Same of 18th: The ledge in the Herman has been stripped for a considerable distance. A splendid hody of chloride ore is in sight. Near by is the Oakland, showing some good ore in the ledge and a large amount on the dump. The New York mine, southwest of the Oakland, has heen purchased by Cincinnati parties, who propose putting on workmen immediately. ....Same of 19th: We saw some ore from the Oakland mine that was completely plated with horn silver. Forty tons of high grade ore are ou the dump. Shaft 55 feet deep....*News*, 16th: The Silver Vault Tunnel struck their ledge a few days since, and are obtaining fair assays....Noonday has struck good ors....First bar from the Tom Paine, valued at $986, was shipped on 14th inst....Virginia mine has suspended operations for the present, owing to cost of milling their ore. This was, all told, $58 per tou. The ore last month averaged $160....*Empire*, 19th: The Treasnre mill yielded $805,000 per month for July and August.

UNCLE JOE TRENCH.—*Enterprise*, 15th: Our old friend has just had seventy tons of ore from his mine crushed at Avery & Co.'s Newark mill, and obtained bullion to the value of $8,113. The rock was taken from the very surface of the lead, and in mining it some immense pieces of rock were hlasted out and rolled down the hill to the road, where they were put upon the wagons and sent to tho mill where they were worked with the rest.

RICH ASSAYS.—Virginia correspondent of S. F. *Herald* 19th, says: I had eome ore eent me three or four days ago to get assayed. It was from the Minnesota claim, three miles north of White Pine, near Morton & Wells' Three-mile Station, on the Elko road—a new discovery. I gave a third of it each to Wiegand & Co. and Ruhling & Co;, Gold Hill, and the other third to Bousfield & Co., Virginia. The three assaye turned out within $100 of each other, and averaged a little over $3,500 to the ton. They speak of their claim, however, as containiug only two pay etreaks of this ore, from one inch to ten in. in width.

OUTSIDE DISTRICTS.—Cor. of *Enterprise*, 14th: Eureka district—Four large ledges have been partially opened. Abundance of wood, water and grass. The Bromide Hill Mining Co. is operating there....Patterson district, samo of 17th: Martin & Davidson'e mill goes into operation this week. There is a large amount of work going on, and the ledges ehow well....Considerable work has been done in Shoehone district....Dr. Gilbert reports everything ae looking well in Kern district....*Reveille*, 14th: The Chihuahua shaft in Newark district is down 100 ft. Forty tons of excellent ore in the dump.

California Manufacturers.

California and the Pacifio Coast is fast hecoming independent of the East for tho great hulk of her manufactures. For many years after tho advent of the gold seekers on this coast, our people imported almost everything which entered into the daily eonsumption and necessities of civilized life. California was supposed to be useful only for gold digging—an out-of-the-way region where people might come to retrieve a lost fortune, or build up an original one, which was eupposed all would go elsewhere to spend. Even our wheat and flour was brought from a distant and foreign conntry.

But a ehort time sinco nearly all onr furniture, bulky as that article is, came from the East. Our carriages, another equally hulky article, were manufactured iu New York or New England. Our boots and shoes came from Boston; while Eastward bound ships carried thither California hides to be tanned and worked up, aud take the round trip hack again *via* Cape Horn—thus making a doublo transportatiou of 20,000 miles oach way. Even our most ordinary clothing came from ahroad, as well as almost every other article of ordinary supply. Now how changed! California from beiug an importer of cereals, has become the second, if not tho first wheat growing State in the Union, and hundreds of ships are annually required to transport her grain crop ahroad, which finds its way into nearly every country on the globe.

Notwithstanding tho great scarcity and high price of skilled labor, the cost of transportation, loss of interest, etc., so favors us that most of the principal hranches of manufacture are now carried on here to a greater or less extent. The exhibition which is now in progress in thie city, affords ample evidence of this fact.

The skill and perfection to which we have arrived in many hranches of manufacture, is really remarkable for so new a country. Take for instance, the article of furniture. The rickety fabrications, which made one almost sick of the word furniture, in the early days of our advent here, have given place to artistic excellence and matchless beauty in this branch of industry which is nowhere in the wide world excelled. Even the peerless galleries of the most refined European nobleman might be furnished from San Francisco workshops, with articles of furniture, which, for gracefulness, durability and pleasing and elegant forms and finish, would fill the measures of excellenco formed by the most scrutinizing eye.

Owing to the late unfortunate differonces between employers and employed, our boot and shoo business, just at this time, is somewhat under a cloud; but the prospect of its future never was hrighter. Cheap labor is being gradually introduced, hy the employment of which manufacturers will soon he enahled to once more regain their footing, and under circumstances which will effectually preclude any further interruption, either from Eastern competition, or from excessive and impossible demands of home lahor. Our production of leather is steadily increasing in quantity and improving in quality. We have now a large numher of tanneries, scattered all through tho State, and especially in and near this city and in Santa Cruz. Not less than seven or eight are now in active operation in the last named place, one of which is turning out $20,000 sides a year; the total annual product of the Santa Cruz tanneries beiug ahout 60,000.

We can point with equal pride to the success of the woolen manufactures, which are now springing up all over the State and in Oregon. San Francisco will soon have in operatiou one of the largest woolen factories in the world, operating with a capital of five millions of dollars. Our machine shops, foundries, etc.,) are fully able to supply our heaviest as well as our most intricate necessities. We have now a rolling mill, a puddling furnace, and two iron furnaces in full hlast, turning ont pig iron, and working up the samo into auy form from a nail-rod to railroad iron.

In the finer articles of cutlery, etc., although we are not yet able to supply but a tithe of our necessities, we are able to turn out work with a degree of excellence which has elicited admiration from even the most appreciative European huyers.

There are numerous other branches of business which might be enumerated, did time and space permit; and there are many others still, not yet established here, which might he eutered upon with every prospect of success. The time has now come when manufacturing on this coast is no longer an experiment; and when our own capital and capital from abroad would do well to look into the same, as a means for profitahle investment. Manufactures must form an important element iu tho prosperity of our people—without them uo State or natiou can bo really prosperous aud independent.

THE LAUREL BILLIARD PALACE.—Everybody was surprised and delighted at suddenness of the construction and the beautiful interior of Messrs. Strahlo & Hughes' laurel billiard palace. Nobody in the Fair saw it built, so far as heard from. Certainly we were looking in another direction at the moment, just hefore our eyes wandered thither accidentally and disclosed it to us. Its existence in the Fair is a wonder attrihutable probably to some magic cue in the possession of Strahle & Hughes. Were those panels derived from tropical forests, or from trees growing in distant regions, unaccessible or out of the world, we ehould go into ecstacies over their heauty, and write two eolumns abont the laurel billiard palace.

WE notice that the California Wine Cooperage, M. Fulda, Son & Co., proprietors, are manufacturing four large casks for the Lake Vineyard Wine Co., one of which is very nearly completed, and will be on exhibition at the Mechanics' Fair next week. It is made of Eastern white-oak staves, three inches thick at the head and chine, and 2¼ thick in the hnlge. Its dimensions are 11x8 feet, bound with fourteen iron hoops, weighing together 1,200 pounds. The whole cask will weigh when finished, 5,000 pounds, and will have a capacity of 4,148 gallons. It is by far the largest ever made on this coast, and probably the largest used for the purpose in the United States.

A NEW STORE TRUCK.—It has always been known that the common store truck needed improvement, but while all other whecled vehicles have, from time to time, been altered or changed, this is now about what it was fifty years ago. A. V. Smith, of this city, exhibits a store and steamboat truck having three important improvements. It has a "dead lock," and while upright aud being pulled down, cannot roll hack. When down, it is free to roll either way. The importance of this is obvious. The brake to ho applied only to be used ahout wharves, and on the inclined gang-plank of a steamboat. The load rests on a emall portion of the middle of the axle and can he rocked or rolled on the wheels alternately when going down a grade, thus impeding progress.

It has very crooked handles on a new plan, and cousequently no tight grasp is uecessary to pull up a grade, or through mud or sand. Its cost does not exceed that of the ordinary truck.

THE Univereal Yankee Nation dispatches from India to the London papers, dated August 20th, state that the muuicipal council of Sogin, (Cocnin China) is hereafter to be chosen one-half from the Americau residents of that city. The Yankees meet with moro encouragement in China than the Chinese do in America.

San Francisco:
Saturday Morning, Sept. 25, 1869.

Notices to Correspondents.

Jewel, Mokelnmne Hill.—The diamond sandstone of Golcouda is composed of more or less compact hreccia, red and white, without fossils. With the subjacent limestone it covers large areas, in almost horizontal layers; hnt at the edge of the plains of Cuddapah it rises in highly-inclined strata nnderlaid hy granite.

S. P. M., San Lnis Ohispo.—In the earlier stages of society, hoth of old and new countries, even where civilization may have advanced, the planting of timber trees is neglected, owing to self-sown forests heing found more than sufficient for a lengthy period to snpply the wants of a comparatively sparse population. As the latter increasee, and civilization advances, forests, in many cases, are viewed as impediments to agriculture, and not as sources of wealth, Under such impressions, the removal of trees sometimes hecomee more thought of, than the desire for their propagation, or the manner in which, if planted, they should he treated so as to prodnce the hest timher in the shortest time, and in the greatest amount. The stndy of these points, conjoined with the question how the trees can he made at the eame time to yield some profit whilst the timber is maturing, is one that mnst, at a not very distant day, become an important question in California.

Land Surveyor.—For the purpose of decimalising calculations for the acre, it has heen proposed to do the same as is now being done in the United States with the English standard ton of 2,240 pounds, which in America, is more conveniently calculated as 2,000 pounds. Thns the standard acre is 4,840 yards, in place of which, if the standard was made 4,000 yards, the calculations could be easily decimalized as follows: One equare perch equals 25, instead of 30¼ square yards; forty sqnare perches, or one rood, equals 1,000 instead of 1,210 square yards; four sqnare roods or one acre, eqnals 4,000, instead of 4,840 square yards. To assimilate these proportions to lineal measurement, it has heen suggested that the lineal mile should be 2,000 yards in place of 1,700 as at present. By this means, the sqnare mile, in place of comprising 640 acres, would cover 1,000 acres, and every 1,000 square milee would embrace one million acres.

Diurnal.—The late Mr. W. Hopkins, of Cambridge, England, demonstrated from astronomical and mathematical data, that the crust and fluid nucleue of the earth (if the latter exists as he admitted) must move together nearly as if they formed one hody, while Prof. Heunessy, of the Irish Catholic University, maintains that there must he great frictiou betwcen the nncleus and the interior of the crust. This distiuction hetween the deductions arrived at by Prof. Hennessy, and those hy M. Delesse, respecting the mode hy which the cooling of the central mass and suhseqnent crystallization occurs, are the reverse of each other.

Statistics—From the Great American Desert.

An anthority in the September *Overland Monthly*, whose fignres should have the merit of heing advisedly put together, estimates the population of "White Pine" at 15,000; of Hamilton, the county seat and point of arrival and departure, at 4,000, of Treasnre City, at 3,000, and of Shermantown, at 2,000,—all of which cities have theaters, if not churches. The railroad cities, Trnckee, Reno, Winnemucca, Elko, Carlin, and Ogden, already count their popnlation hy the thousands. Trnckee is known and recognized as a "large city;" Elko, if we are to believe reports, is even larger than any of the White Pine cities, an official estimating its population at 5,000, which is perhaps not more than a thonsand above the mark.

Treasure Hill and its spnrs are yielding from $300,000 to $400,000 monthly, according to the stated bullion reports. The Great American Desert, thus it appears, has "come ont." Winter is at present approaching, the Pogonip occasionally threatens on the elevations as September advances, and railroad passengers from White Pine are heard to remark that "everybody is getting out of the country,"—for winter, that is, hecause great confidence seems to he felt by good judges in the permanence of the mines.

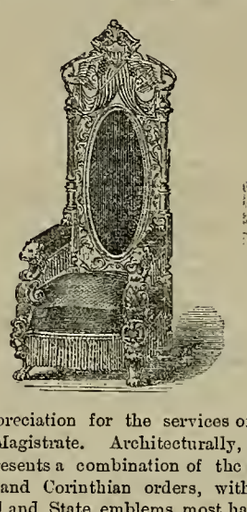
To the rabbits and to the Indians who love the piñon's shade, this "Great American Desert," of sage flats and scrub pine mountains, is really a land of beauty. We will acknowlede that even to us, who have campaigned in it, the sage brush valleys seem, after a few years of absence, a plcasant land; with its corn-colored plains from golden to baker's brown, its sweet-scented trees, and here and there its green oases with plenty of fresh water; with its great open fire places, and substantial fare. Look at the country as it will be by and by, when all these little oases shall be enlarged hy irrigated additions, with plentiful fruit trees in hearing, and the travelcr himself no longer in a craze after wealth; tho host a man who is settled contentedly with a reatonahle share of prosperity. "Blooming and hlossoming like the rose" will not he too poetical a description. There are peculiarities and heanties helonging to those inter-montane valleys that will make people attached to them; beauties of sky, of season, of sunrise and sunset, that would prove a rich field of stndy to our original landscapists, our Gignouxs, Churches, and Bierstadts.

Of the permanently yielding wealth that rests embowelled in the interior wastes, and of the excellent producing capahilities of Nevada's irrigated soil, we need not here speak. Men of good judgment do not pronounce it a "hilk" because it fails to reward any kind of fools' nndertaking with a fortune. American adaptiveness is making out of many and many a spot in the "desert," a place fit to live in, no longer out of the world.

Rickard's Slum Amalgamator. — A practical idea of Mr. Rickard's, to which we have heretofore alluded, for slum amalgamation, tried with favorahle results on some Virginia City slums recently, in England, is in proccss of introduction into some of onr mills, a large machine to do the work heing at present under way at the Union Foundry. A great amalgamating surface with agitation, embraces the whole, the machine being very simple—a trough four by six feet and four feet deep, having in it a horizontal shaft, with some dozene of amalgamated disks attached in screw arrangemeut for stirring. For argillaccous slums, like those of Virginia, this arrangement for an amalgamator is precisely what common sense would suggest. To give a hetter idea of the machine, however, we will have an illustration of it next week.

The Presidential Chair—Art in Furniture.

It is seldom that so mnch of art and rare excellence in furniture is grouped in so small a space as is devoted to the furniture show in the present exhibition at the Pavilion. Art evidently occupies an important position, if, indeed, she does not reign supreme, in the economy and design of furniture mannfactured in this State. Her influence is everywhere apparent, whether in the matchless beauty of the various woods selected, or in the judgment and taste that is employed in giving them form and beanty. Any attempt at a full description of all the heautiful articles on exhibition, within anything like moderate limits, would prove a failure; hence, for to-day, we confine onrselves to a pictorial representation and particular description of the elegant chair designed as a present to Gen. Grant, and which has been manufactured hy N. P. Cole & Co., of this city, to the order of a numher of gentlemen from various parts of the State, who have taken this method of manifesting their regard



and appreciation for the services of our Chief Magistrate. Architecturally, this chair presents a combination of the semi-Gothic and Corinthian orders, with our National and State emblems most happily combined, and eo arranged that each hecomes a part of the main design. Being a token of esteem "from California to President Grant," it has been most appropriately constructed entirely from California material, and by California workmen. The wood-work is from our heautiful native laurel, npholstered in light hlue hroad-cloth, trimmed with heavy silk fringe in corresponding color.

The carving is most elegantly designed and most elaborately executed. The front legs represent the feet of the California lion, bearing up the fruits of our State, with sprigs of live oak and laurel in relief. The uprights of the arms consist of elegant scroll-work, chaste in design and execution, each most appropriately surmounted with the head of a grizzly, guarding the entrance to the Presidential seat.

The back of the chair is worked out from a single slah of selected laurel, the general design of which is distinctly shown in the accompanying engraving. The oval center is seen surrounded with richly carved scroll-work. Upon either side rests a chastely designed Corinthian column, each supporting a glohe, upon which are perched American eagles, with wings raised and thrown back in defiant attitude, and grasping in their beaks the folds of the national flag, two of which are elegantly draped, with standards across, directly ahove the oval. Surmounting these flags is a laurel wreath, encircling the American shield; over and crowning the whole of which is a beautifully designed and carved piece of scroll work, forming an appropriate finish to this really artistic piece of California furniture. This elegant piece of work was designed and carried out in all its particulars, to successful completion, hy Mr. B. P. Moore, a well-known and popular attache of this establisment.

Railroad Passes and Transmontane Roads.

Must we have another railroad across the mountains? asks the Virginia *Enterprise*, in reviewing the Chicago *Tribune's* argument maintaining such necessity. Snow sheds and snow slides, and fires in summer, are the difficnlties of the present road.

Along the railroad, and in Central Pacific Railroad circles, the opinion is very confidently expressed that no other road will, for an age, he nndertaken to he hnilt hy any responsihle company. However desirable would he a more open road, with the pure air of the mountains to hreathe, instead of shed dust and smoke, with daylight and grand monntain views to enjoy as we pass, it seems all but certain that we will have to content ourselves in this latitnde with the present Central Pacific route. The great channel is marked out, and the river of trade and human life is flowing, wearing into the hanks here, and depositing its flats and terraces there. Another crossing will prohably be made on Oregon account, near the Oregon houndary, for the C. P. R. R. Co., northern extension. The Southern Pacific Railroad will surely be built, and speedily; the undertaking heing easy in comparison with the first great overland railroad, since more thau a third of the distance will not necessarily have to be built by the company at all, viz., the stretch from tho Missouri river to the Rocky Mountains, and the distance between San Francisco and San Diego; the latter city hei ng the natural terminus for tho southern road. A glance at the map will suffice to convince how much shorter a piece of work this southern road will he. It remains a question of time, bnt of no very great duration, how soon Montana and Oregon will strike hands with Minnesota, and give real impulse to Holladay's terminus at Puget Sound.

Will You Tap the Comstock Lode?

Mr. A. Sutro is lecturing at Virginia City, and advertising and pushing generally the great project of tho Sutro Tunnel Company, to tap the Comstock lode. Thie company owns a liheral franchise, ohtained from the national govornment as an encouragement to proceed with the enterprise,—the importance of which is, on general principles, precisely equal to tho importance of the ore deposits of the Comstock, in continuous depth. But matters look confused to us, on this tunnel question, for Sutro is "fighting the Bank" with his keenest spear; while the Bank of California, the controling owner of the Comstock lode, sits brooding over the mining shafts of Virginia City as silently and as innocently as if it had done nothing at all, and inteuded to do nothing in the world detrimental to tho mining interest in general, or the project of the Sutro Tunnel Company in particular.

Whoever may succeed to the ownorship of this franchise, let the work be hegun; for that the Comstock lode warrants it, is the general opinion expressed from late developments. And let it he tapped deep enough to make it worth tho while to have an adit.

White Pine Silver Lead, assaying from $60 to $80 per ton, is being shipped to this city by the "White Pine Mining Company" at a cost of $40 per ton. It can be here cupelled or desilverized with zinc at $5 per ton; leaving a profit of $15 to $35 per ton, without reckoning the value of the lead.

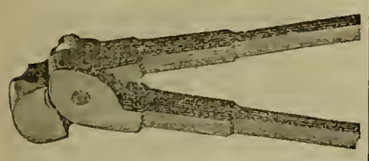
The case of the Hidden Treasure *vs.* The Rathhurn, is withdrawn, the Hidden Treasure Company paying the costs. Some of the heavy stockholders in the one were also in the other.

The Austin *Reveille* is again a daily, hut we miss the trenchant, sharp pen of its former inspiration.

Axtell's Improved Wire Cutter.

We give, annexed, a representation of a new and very useful instrument, recently patented by Henry Axtell, of San Francisco, which is designed for use in cutting wire or bolt-iron of the smaller sizes, whereby much time is saved, and the work is more conveniently and neatly done than by the instruments generally used for such a purpose.

Referring to the accompanying engraving, it will be observed that the instrument is formed of two pieces connected togother by a rivet or bolt. These two parts act as levers, having the rivet for a fulcrum. Each part has a cutting-edge; but the cutting-edges are arranged so as to work eccentrically to each other, and on a line with one side of the instrument; thus rendering the instrument far more effective than it would be with straight cutting-edges. The



short distance of the cutting-edges from the fulcrum, as compared with the long end of the levers, is such that great power may be applied to any resisting medium, which may be placed between the edges, as a piece of wire, bolt, etc. To render the tool more strong and durable, the cutting end of the lower arm, as represented, is made forked, so as to embrace within its double extremity the cutting end of the upper arm. By this means, the rivet, or bolt, which acts as a fulcrum, is supported at both ends.

This tool may be made of any desired size or strength, and is particularly adapted to cutting off the ends of bolts, in carriage making, and other similar work, as well as rivets in a fixed position; which latter object is accomplished by the cutting-edge being on a line with the side of the instrument. When made of proper size and strength, it is well adapted to blacksmith or machinists' use for cutting up small iron, and for a great variety of purposes, which must be obvious to all workers in iron, brass or copper. The instrument may be seen upon the bench, at the east end of the machinery department, at the Pavilion.

Mr. Axtell designs disposing of rights, and at once introduce his improvement throughout the United States.

IN THE RANKS AGAIN.—We would call attention to the card, in another column, of our retired Chinese Minister, Hon. J. Ross Browne. Having thrown off his official robes, Mr. B. is again in the ranks, doing good service for the State in his efforts to encourage immigration to the Pacific slope, and promote the investment here of Eastern capital.

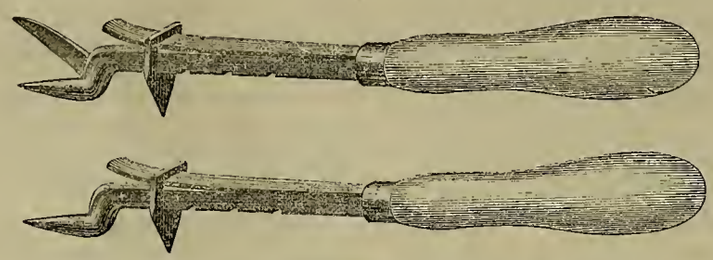
Mr. Browne possesses the happy faculty of being able to throw his best efforts always into some timely undertakings, such as are capable of producing the most important results. Where there is a case of obvious neglect by the Government—as in our former want of collected mining statistics—he sees the public's interest, and supplies the want, to his own credit and the advantage of everybody. While we are certain that his continued services at this juncture would have been good for our country's cause in China, we are glad to be able to commend his energy and promptitude in finding so speedily another unoccupied field of usefulness, which is not in any degree less important than his previous undertakings for the advancement of the Pacific coast.

THE OVERLAND MONTHLY for October is now out, and contains some highly attractive title subjects.

Improved Can Opener.

We give herewith an illustration of a device recently patented through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, by Eugene F. Dewey, of this city. This device has for its object the provision of an instrument more readily adjustable and more effective in its action for the opening of cans than anything heretofore devised. It consists of a combination of cutters so arranged and adjusted that a can may be opened either by cutting out a circular disk, or by cutting in a straight line, as is desirable in opening sardine and boxes of similar construction.

Referring to the engraving, a pointed knife or cutter will be first noticed, with the edge downwards, made adjustable by being placed loosely upon the bar and held firmly in position by the slots on the under side of the bar, and the spring above. In actuating this knife, the lower rounded point upon the extremity of the bar is first thrust through the center of the can cover, when by using the handle as a lever, the knife may be carried around in a circle in the operation of cutting, thus taking out an entire disk-shaped piece. By adjusting the cutter in the slots at a greater or less distance from the point of the instrument, the disk removed may be larger or smaller, as desired.



E. F. DEWEY'S IMPROVED PATENT CAN-OPENER.

For cutting in a straight line, the flat blade or knife forming the opposite point from the round one already noticed, is first thrust through the tin, when, by bearing down upon the handle, the point of the spring already noticed acts as a fulcrum, whereby the blade is made to cut forward in a straight line; then by alternately raising and depressing the handle, and pushing the instrument forward, a cut may readily be made across the can in any direction desired. By this means we have combined in one instrument, a cutter for both circular and square cans, easily adjustable and worked; one which cannot readily get out of order. When once employed, so that its usefulness may be fully appreciated, no family using can-food would think of getting along without it.

When an exceedingly cheap instrument is essential for circular cutting only, this instrument is made without the straight cutting knife, as shown in the second figure.

The inventor is confident that he has the most easily adjusted and durable can-cutter that can be made and sold at a low price. He is now manufacturing and intends to bring them into general use. Parties who desire to purchase rights or give orders, can address E. F. Dowey, box 17, San Francisco. The instrument can be seen among the models at the FAIR PRESS office in the Pavilion.

PARTIES of miners have been engaged in prospecting the hills near Hayward's for coal, etc. One miner claims to have discovered a vein of plumbago under lime rock.

SOME of the Eastern papers say that Gen. Rosecrans will make $5,000,000 *out* of his mining speculations in this State. The report may be true, for it is doubtful whether he will make it *in* them.

THE STATE UNIVERSITY opens this week, with some necessary and appropriate flourish and talk.

Mining Machinery.

VARNEY'S PAN may be seen in operation this evening on an 80-pound batch of ore roasted by a new economical roasting process invented by Mr. Frick. The principle, in pan amalgamation, of rapid grinding, with what would otherwise be nothing more than an iron arastra, is due to Mr. Varney's practical mechanical sense. To prevent throwing over pulp by rapid revolution, he applied, as early as 1860, the counter arms which direct the pulp back again to the center, and underneath the mullers—while the quicksilver remains at the periphery to pick up all the metal that comes in contact. Mr. Varney has made a perfect iron mill of his pan, by getting the effect of the burrs in a stone,—a result very ingeniously accomplished, and multiplying the grinding capacity one hundred fold. He cuts radiating grooves into his bottom, and inserts strips of wood which soon wear into the proper corrugation. A very favorable circumstance in the iron mill, so arranged, is that both the upper and lower shoes keep nicely sharpened of themselves, requiring no dressing as with stone.

HEPBURN'S PAN, situated by the side of Varney's, was also being put into order for working this afternoon; it is worthy of special notice by those interested in milling.

Two novel crushing machines invented by Mr. John A. Collins, of Virginia City, may be seen in the same vicinity. The one is merely a model, but does the work of crushing pieces one inch in diameter, the large machine being intended for 20 inches. The other is a barrel pulverizer, by which the common disadvantage of doing the crushing work two or three times over, is avoided, the fine dust particles being carried out as fast as they are ground into that condition.

LARGE BLOWER.—The "Root's Rotary Blower," sent to the Fair in different sizes by Keep & Bargion, of Stockton, is an American invention of some importance to smelters, as it is no more costly or complicated than the ineffective common fanning mill blowers, while its power is equal to that of the far more costly cylinder blowers, of the same size. In starting smelting works, a question of the highest importance, next to cost of construction, is to have wind enough, and means of regulating it. The No. 5 rotary blower gives a pressure of 15 pounds to the square inch, or, measured by a column of water, such as would raise a column three feet high. Keep & Bargion's blowers are much used, and are found very effective for ventilation in the deep mines of this State and Nevada. A miniature blower made in this manner is found to answer excellently for a blacksmith's forge, portable or otherwise.

THE PRESS representatives attending the Mechanics' Institute Fair are: Bausman, for the *Alta;* Howe, for the *Bulletin;* Basset, for the *Herald;* Dr. Ames, for the *Times;* Rock, for the *Call;* and De Young, for the *Chronicle.* The Sacramento *Union* has a working correspondent who remains *incog.*, but "Ridinghood," of course, also comes to the Fair.

Special Compliment.

MESSRS. DEWEY & Co., *Patent Agents*—Gentlemen:—Allow us to express our thanks for the gentlemanly, prompt and business-like manner in which you have conducted our business before the United States Patent Agency at Washington, D. C. We believe that inventors on this coast will materially advance their interests by patronizing your Agency. The Reversible Door Butt and Double-Acting Blind Wiring Machine cases were hardly forwarded from your office before we were notified of their having been allowed.

JEFFERSON KINDLEBERGER,
WILLIAM A. ARNOLD.

HALLIDIE'S SUSPENSION BRIDGE across the Pavilion near the fountain, is an excellent arrangement for flying from gallery to gallery, put there in order to save lazy people the exertion of walking around a quarter of a mile. It is so light and airy that many who have come to the Fair have not seen it, though they have ogled at others in the galleries through it. That so light a structure can be both strong and durable,—at the same time that its construction is comparatively cheap,—needs only the observation of a few minutes while people are in the act of crossing to insure satisfactory conviction. Those who are interested in such practical flying machines,—to enable them to cross gorges, torrents, deep places, gaps and uncomfortable hollows in this world, and on the road to the next,—should visit the lower gallery, and look at the photographs of bridges built by Mr. Hallidie, across some of our mountain rivers.

UTILIZING THE POWER OF STEAM.—Mr J. L. Constable, the Chief Engineer o the Mechanics' Institute Fair exhibits one of Carvalho superheater at the entrance to the engine-room, open, and displaying the principles in a manner to make apparent the advantages of that important power-saving invention. A model is also shown of Constable's own process of generating steam by causing a flow of superheated steam to be met by the water from the boiler (by their own pressure) in a separate vessel, and there to generate steam by contact, of any temperature that may be desired. Another great saving of power is to be secured in this manner.

WHITE PINE CABINET.—Mr. Biggs, of E. M. Smith & Co., Treasure City, sends to the Fair nineteen boxes of ore, fossils, etc., from 107 White Pine mines, and the editor of the *Inland Empire* guarantees that every specimen in the whole collection is correctly labelled. The miners of White Pine are not generally very clear as to mineralogical distinctions; azurite, (blue carbonate of copper) and chloride of silver being quite the same thing; everything is chlorido except horn silver, and that is the metal itself. Some of these who are more than ordinarily sharp, recognize bromine—bromide of silver—very extensively. White Pine has much of interest to contribute mineralogically that is yet undetermined, and Mr. Biggs' collection will add to the attractions of the Fair.

ELKO COAL.—We saw yesterday at the Hale & Norcross hoisting works, eight tons of stone coal which comes from a mine near Elko. It is bituminous coal, and appears to be of an excellent quality. At the time of our visit to the works yesterday afternoon, they were just firing up with the coal. Mr. Fair, Superintendent of the mine, intends running the works a week with this coal, carefully noting the quantity consumed. Delivered in this city it costs about $30 per ton. Whether it will prove a cheaper fuel than wood remains to be seen. The lot we saw was but the first load of a large quantity ordered.—*Transcript, Sept. 18th.*

The telegraphic reporter of Virginia, on the 23d, says: It appears that the Elko coal, which was tested at one of the mills, does not answer. It is too light and burns too rapidly. This has been the difficulty with all coal yet found in the State.

Elegant Shell Work.

In the central Art Gallery of the Mechanics' Institute Pavilion, Mrs. John C. Daggett exhibits several pieces of most elegant shell work, made up of shells from every portion of the globe. Unlike most articles of this kind, these are really works of art. The shells are wrought into flowers of various kinds, sizes and colors, from the tiniest daisy to the full-blown rose, lily, etc. In their arrangement much taste and judgment has been shown in the proper blending of colors. It seems almost impossible that so much effect can be produced, and such a close imitation made, by shells alone, to the natural color, form leaves and petals of flowers; and yet not a particle of coloring matter has been employed in the entire collection. The shells have been merely cleansed of their extraneous matter, so as to show their natural colors in their greatest effect.

Upon one of the pieces two elegant cornucopias pour forth their riches of shell flowers and brilliants—the whole forming an oval encircling a vase of flowers and mosses. There are three with center pieces, and one which is intended for a frame, now encircling a photograph of President Grant. Mrs. D. also exhibits a shell work basket of flowers, which may be seen at the FAIR PRESS stand.

The difference between this and the like work as ordinarily seen, is as marked in the firm and durable manner in which it has been put together, as in the artistic effect displayed. The shells are all secured by durable cement or tastily arranged and hung upon delicate wires, so as to admit of quite rough handling, and of being thoroughly cleaned from dust, etc., when required. They will even stand the rough usage of the Isthmus transit to New York, when properly fastened by screws to the bottom of a box, which is the mode in which they are packed for transportation. This work is for sale; information in regard to which may be obtained at the office of the DAILY FAIR PRESS.

THE WOODEN WASHERWOMAN, is the name given to a new washing machine, invented and exhibited by Mrs. A. B. Waldron. In the construction of this machine, Mrs. W. adheres strictly to the old-fashioned device of the rubbing board; but, instead of operating upon a single board, and holding the clothes in the hands, she has contrived a wooden holder, which passes the linen back and forth between two washboards, in such a manner that the friction is brought to bear upon both sides of the garment at the same time. The clothes-holder is operated by means of a lever grasped in one hand, while the other is free to regulate the pressure as may be desired. Don't forget the "wooden washerwoman"—pass it not by; but stop and hear its merits set forth by the inventress. It is cheap and simple, and much excellence is claimed for it as an aid to the laborious process of washing.

PATENT
Boiler Scraper and Tube-Cleaner.

IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.

A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers.

These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.

For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. D., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1863.]
"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.

To Quartz Mining Companies.
To be sold positively within the next three months—the MINES, ENGINE, MILL, and entire Machinery of the TEMPLAR NO. 2 Quartz Mining Company, located at Indiana Ranch, Yuba County, consisting of—
One Steam Engine, 60-horse power, made by Burden, Brooklyn, New York.
Two large Boilers, in complete order.
One Eight-stamp Battery.
One Chile Mill.
One Cornish Lift-Pump, 6 inches, of superior make and finish.
280 feet of 5 inch Iron Suction Pipe.
One large Water Tank.
And also all of the necessary machinery, with Belting, Feed Pumps, Hose, Turn Tables, Cars, Ropes, Track Iron, Flumes, Plates, with Blacksmith Shop and all Tools and requisite implements to be found in a large and first class quartz mill.
The Company having ceased operations intend selling off their effects as speedily as possible.
For particulars as to price, etc., address, by letter or otherwise, L. W. CAMPER, at Indiana Ranch; GEORGE B. HORNISH, Marysville; or R. W. HASKELL, Pacific Fruit Market, San Francisco 24v18-1m

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the PRESS from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers or others will please inform us.

Spice from the Daily Fair Press.

A HEN by day is a rooster at night.

A VEILABLE space—s woman's face.

A COMPETENCY—A little more than you have.

A FATHER to the thought—A parenthesis.

WHY is a mouse like a load of hay? Because the cat'll eat it.

A WORK OF FAITH—Eating sausages made by an unknown butcher.

WHY is the road of trangressors so hard? Because it is so much traveled.

The person who can best cater to the taste of the youug—the edu-cator.

BRIGHAM YOUNO weighs 240 pounds. Not much, if divided by twenty-seven.

SOME of the sidewalks of San Francisco are anything but paths of pleasantness.

"Didn't you, massa?" replied Pompey, "I know'd it jist tho timo it occurred.'

WHY is quinine like sausages? Because there is a good deal of bark in both of them.

A FEMALE clergyman who married a couple in Iowa kissed the bridegroom. And why not?

PHILADELPHIA has several free baths. Free lunches are more the rage in San Francisco.

WHAT is the reason so few medical men are "wide awake." Because they are always dosing.

SOME young fellows run to cheek, like cabbages, when their heads are uncultivated run to seed.

"A PRUDENT man," says a witty Frenchman, "is like a pin. His head prevents him from going too far."

"POMPEY," said a gentleman to his servant, "I did not know until to-day that you were whipped last week.'

A BUTCHER on Fourth Street advertises to sell eight pounds of sausages for a dollar. That is literally dog cheap.

ALL TEUTONS ARE NOT GERMANS.—Many of the ragged urchins who toot on tin horns are Irish.

JONES used to dote on his Sarah Jane, till he saw her at the theater with another fellow. The sight acted as an antidote.

IT is not necessary for a candle maker to be learned in the dead languages, but he should have a good knowledge of the mysteries of grease.

A MISSISSIPPI steamboat passenger fell overboard and screamed for dear life till he thought of standing up, and found the water just knee-deep.

MINX appear to be all the rage just now, great numbers may be seen in the Fair every evening. Most of tho young men appear to bo anxious to trap them.

A CARPENTER being asked for a riddle, propounded the following: "I picked it up; I couldn't find it; I put it down, and went along with it." No one could guess. It was a splinter in his foot.

SOME of our lady readers want to know why the fashionable game among the swell gamblers is called "draw poker." Jones says it is because so many of the players burn their fingers by playing at it.

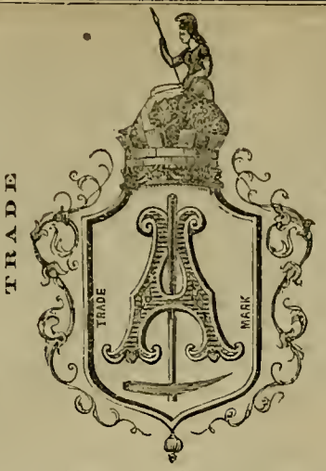
DISTINGUISHED ARRIVALS FROM ABROAD. John Smith, from London; Joe Bowers, from Missouri; Dick Dudgeon, from Arkansas (an Arkansas traveler); and Mr. O. B. Jabers, from Cork, are staying at the Cosmopolitan Hotel.

IF you are a wise man, you will treat the world as the moon treats it. Show it only one side of yourself, seldom show yourself too much at a time, and let what you show be calm, cool and polished. But look at every side of this world.

A CRAZY man having got into the gallery of the United States Senate during a wrangling debate, was taken out, the Sergeant-at-Arms telling him that he was out of place in the gallery. "That's so," said the lunatic; "I ought to be on the floor among the Senators."

A MINIATURE WARDROBE.—Tucker & Co., the jewelers, are making a gold wardrobe for Elise Holt, to hold her dresses when playing at the Alhambra. The affair is about as large as a sailor's "baccy box," but will hold three suits of the little great Blonde's usual theatrical attire.

DURING an examination in history at a young ladies' seminary, one of the pupils was asked: "Did Martin Luther die a natural death?" "No," was the reply, "he was excommunicated by a bull." Another student in astronomy was asked: "What is the milky way?" "The milky way is a collection of white clouds in the sky, called the trade winds or aurora borealis."



New Almaden Vichy Water,

(CALIFORNIA VICHY WATER.)

FROM THE SPRINGS,

NEW ALMADEN,

Santa Clara County.

F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.

OFFICE, 506 JACKSON STREET,

GENERAL DEPOT:

Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the venous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness with the ADVICE OF A PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever*; Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever*; Gout, *when the patient is still able to walk*; Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returnod Bottles Bought for Five Cents apiece

Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v18tf

Ayer's Cathartic Pills,

For all the purposes of a Laxative Medicine.

Perhaps no one medicine is so universally required by everybody as a cathartic, nor was ever any before so universally adopted into use, in every country and among all classes, as this mild but efficient purgative *Pill*. The obvious reason is, that it is a more reliable and far more effectual remedy than any other. Those who have tried it, know that it cured them; those who have not, know that it cures their neighbors and friends, and all know that what it does once it does always—that it never fails through any fault or neglect of its composition. We have thousands upon thousands of certificates of their remarkable cures of the following complaints, but such cures are known in every neighborhood, and we need not publish them. Adapted to all ages and conditions in all climates; containing neither calomel or any deleterious drug, they may be taken with safety by anybody. Their sugar coating preserves them ever fresh and makes them pleasant to take, while being purely vegetable no harm can arise from their use in any quantity.

They operate by their powerful influence on the internal viscera to purify the blood and stimulate it into healthy action—remove the obstructions of the stomach, bowels, liver, and other organs of the body, restoring their irregular action to health, and by correcting, wherever they exist, such derangements as are the first origin of disease.

Minute directions are given in the wrapper on the box, for the following complaints, which these *Pills* rapidly cure:—

For **Dyspepsia** or **Indigestion, Listlessness, Languor** and **Loss of Appetite**, they should be taken moderately to stimulate the stomach and restore its healthy tone and action.

For **Liver Complaint** and its various symptoms, **Bilious Headache, Sick Headache, Jaundice** or **Green Sickness, Bilious Colic** and **Billous Fevers**, they should be judiciously taken for each case, to correct the diseased action or remove the obstructions which cause it.

For **Dysentery** or **Diarrhœa**, but one mild dose is generally required.

For **Rheumatism, Gout, Gravel, Palpitation of the Heart, Pain in the Side, Back** and **Loins**, they should be continuously taken, as required, to change the diseased action of the system. With such change those complaints disappear.

For **Dropsy** and **Dropsical Swellings** they should be taken in large and frequent doses to produce the effect of a drastic purge.

For **Suppression** a large dose should be taken as it produces the desired effect by sympathy.

As a *Dinner Pill*, take one or two *Pills* to promote digestion and relieve the stomach.

An occasional dose stimulates the stomach and bowels into healthy action, restores the appetite, and invigorates the system. Hence it is often advantageous where no serious derangement exists. One who feels tolerably well, often finds that a dose of these *Pills* makes him feel decidedly better, from their cleansing and renovating effect on the digestive apparatus.

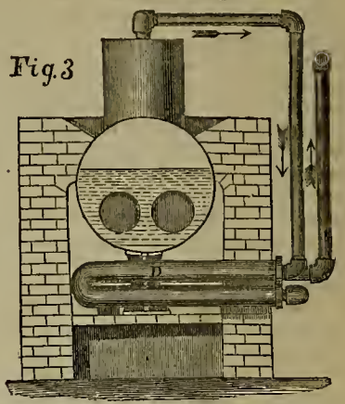
Important to every one using Steam for any purpose.

CARVALHO'S

Patent Steam Superheater



[SECTIONAL END VIEW OF BOILER, WITH SUPERHEATER.]

Saves Fuel! Saves Water! Saves Pressure!

Brief Extracts from letters from parties using Carvalho's Superheater. Full letters can be seen on application:

NAVY YARD, Washington, June 16, 1869.

"Superheater saves 12 per cent. in fuel and 10 per cent. more in speed of engine."

NAVY YARD, Washington, Oct. 8, 1867 (after *seven* years of service.)

"Superheater yet attached to boilers, and appears to be in good order."

HOWARD WATCH AND CLOCK Co., Boston, May 19, 1866.

"Superheator saves us at least 10 per cent. in fuel and gives a large increase of power."

JONES & SMITH, New York, March 21, 1867.

"Superheater saves 20 per cent. of coal, less steam pressure, exhaust more serviceable in drying paper."

STEAM ENGINE WORKS, South Brooklyn, April 23, 1867.

"Superheater saves not less than 20 per cent. fuel; no priming!"

CHECKETT LEATHER CLOTH Co., Newark, N. J., Oct 16, '67.

"Superheater economizes 25 per cent fuel; does our work with 25 lbs. less pressure steam, and steam superior for drying purposes."

N. Y. DYEING & PRINTING ESTAB., Oct 4, 1867.

"Superheater brings contents of our five vats to boiling point in one-third less time and one-third less increase of water; saves us at least 15 per cent. fuel."

CONTINUOUS OIL REFINING Co., Staghampton, N. Y., Sept. 20, 1867.

"Superheaters give entire satisfaction, and wo superheat to 55° deg—an increase of 200 deg."

CAREW MANUF. Co., So. Hadley Falls, Mass., Oct. 17, '67.

"Superheater saves 15 or 20 per cent. fuel; steam for paper mill now perfectly puro and dry—an important advantage in our business."

STATEN ISLAND FANCY DYEING ESTAB., June 18, 1867.

"Superheater saves at least 25 per cent in fuel, and we have the advantage (hardly to be over-estimated) of perfectly dry steam."

ÆTNA IRON WORKS, San Francisco, Sept. 15, 1867.

"Superheater saves 25 to 30 per cent. in fuel; no priming."

CONTRA COSTA LAUNDRY, Oakland, July, 1868

"Superheater causes a use of 50 lbs. steam instead of 60 lbs.; use much less water, and there is a saving in fuel."

HAVILAH M. Co., Cal., August, 1868.

"Superheater causes a use of 40 lbs. steam instead of 60 lbs.; use much less water, and there is a saving of fuel." (2 sets.)

SIXTH MECHANICS' INST. FAIR, S. F. Sept. 4, 1868.

"Superheater used proves that it saves fully 30 per cent. in fuel." (Chief Engineer.)

NEVADA MILL, Virginia City, May 30, 1869.

"Superheater is a perfect success, and saves three cords of wood in ton, or 33⅓ per cent. in fuel; engine works better."

And many other letters of the same tenor.

Awarded Silver Medal, Mechanics' Institute, San Francisco, 1868.

Awarded Silver Medal, Maryland Institute, Baltimore.

Awarded Silver Medal, American Institute, New York, 1865.

Committee Appointments at Fairs.

One of the greatest defects in the practical working of Industrial Associations, everywhere, grows out of the appointment and action of committees of awards. There is always more or less complaint and fault-finding at the acts of such committees. This does not arise, as a general thing, from dishonesty or partiality on the part of either the committees, or the appointing powers; but rather from a lack of proper consideration on the part of both. It is quite too often the case that in the haste of making up committees, they are composed of men unfitted to their duties; and again, the committees themselves, when competent, are too apt to be indifferent to the performance of the duties assigned them.

Perhaps it is not too much to say that the greatest amount of permanent good is or might be accomplished by industrial and agricultural exhibitions through the medium of the facts which are or ought to be spread before the world in the published reports of the various committees. Such reports should be elaborate and well considered. It should be the aim of the Managers to place on every committee, at least one individual fully able and *willing* to look carefully into everything of special interest connected with the class or section upon which his committee is to report. Money spent in printing a collection of reports so made, and which shall be calculated to diffuse valuable information among the people, is the best investment a society can make.

The mere "show" made by a society, however good and complete, will not be considered a success in the minds of an intelligent community unless the information alluded to is in some way brought out. This can best be accomplished by a careful and judicious appointment of committees. A society or association which fails to keep these facts in mind, will fall short in the amount of good which the public have a right to expect from them.

The public itself also, has something to do in this matter. The committees alluded to must be made up from their number. It often happens that the best efforts of managers fail from lack of proper coöperation on the part of those who are competent but unwilling to act on committees—or who, after consenting to accept, fail to give that attention to their duty which its importance demands. We trust there will be no hanging back or negligence on the part of the public, in this respect, in connection with the present Exhibition, in San Francisco.

There is one other matter to which we would allude in this connection. Committees often find it extremely difficult to decide upon the merits of articles on which they are expected to report, by reason of the interference of interested parties or the friends of such. When such persons are allowed, unrebuked, to hover around a committee when engaged in the work of examination, or at other times, before their final report is made, despite the most honest efforts at impartiality on the part of such committee, they will allow their judgment to be more or less influenced and warped. Such interference or improper influence should never be allowed. When there is room even for a suspicion of its existence, the moral effect of any award is destroyed, and dissatisfaction is sure to follow.

We are happy to know that the ideas above expressed are fully in accord with those of the managers of the present Exhibition, and that in additions to due diligence and circumspection in the appointment of committees, precaution has also been taken which effectually prevents any collusion on the part of exhibitors or their friends with members of committees. This latter object has been accomplished by a resolution of the Board of Managers, by which all Committees of Award will be unknown to the public until after the awards have been made and reported to the managers. Every gentleman or lady who has received an appointment upon any committee, at the present exhibition, does so on the basis of a mutual agreement to carry out the spirit and intent of the above resolution. The committees have all been appointed, and will work silently and faithfully in the discharge of their duties. The awards will be announced on the last day of the Exhibition.

The Mechanic.

Nothing has done more to add dignity to the standing and calling of the mechanic, than the institution of Industrial Exhibitions. Time was when the only idea associated with mechanical employment was hard hands, a grimmed face and greasy clothing. Of late years, however, ingenious and successful mechanics quite as often acquire wealth as merchants; while renown is far more frequently linked with the names of successful inventors or engineers, than with those who have met with equal pecuniary success in the mercantile walks of life. Time was when the "workshop" was the only place associated in the minds of many with the mechanic; now his name is indissolubly connected with "palaces of industry," which are springing up in every civilized country, and which are visited and examined with wonder and admiration by kings and emperors, and the "high born" of all nations. The wonderful creations of mechanical skill and ingenuity are admired everywhere.

Before the days of Industrial Exhibitions, genius and education had but little to do with mechanic arts. The same plow was made year after year, and century after century. The scythe and sickle were constantly reproduced, without improvement; while the threshing floor, trod by the ox, gave way only to one beaten by the flail. The windmill and the old-fashioned water-wheel, were about the only aids to manual labor. There was but little in the handiwork of the mechanic to admire—nothing new—nothing beautiful outside of architecture. The mechanic himself was a mere machine, never thinking, never improving, never improved.

By and by somebody devised the common school; in it the child was taught to think. Having learned to do so as a child, he continued the practice as a youth and as a man. The mechanic was at once changed from a monotonous, thoughtless machine, to a thinking, contriving being—he became an inventor—a creator. Industry began to prosper. He devised Industrial Associations—local, state, national, and finally International Exhibitions. Mind was thus brought in contact with mind. The inventions of one man were indefinitely multiplied and improved upon by others. Industry was revolutionized; and the mechanics of to-day stand forth, not only as the bone and sinew of the nations, but also as the intellectual directors of their industries, and, to a great extent, as the framers of their political policies.

It is less often now that the lip of proud beauty curls at the name of mechanic, or the pampered child of wealth turns with feelings of scorn from the man whose palm is hardened by useful toil. The politician no longer descants upon his rights, as though it were a favor in him to grant them; he seeks rather to invest himself with a plumage borrowed from the shop, as something which gives weight and influence to his position.

Education has made the mechanic what he is. Education will do yet more for him if he will only improve his opportunities. The mechanic has now his college, as well as the lawyer, the actor, or the divine. Scientific schools are being established everywhere throughout the world, where degrees are conferred, as honorable and ennobling to the student of mechanical science, as to him who finds his specialty in the classics, law, medicine, or divinity.

Armstrong's Patent Heater.

This new apparatus for diffusing a pleasant, moderate heat throughout a room by means of an ordinary coal oil lamp, without in the least interfering with the light of the same, is one of those unique and simple inventions that strike the wants of the people just in the right place. While not pretending to take the place of a stove, it appears just the thing for this climate, when it is only necesary to take "the chill off," to render a room comfortable. The apparatus consists of an outer cylinder, supported on a tripod over the lamp, the top and bottom of which is perforated with a number of air-holes. Within this there is an air-tight funnel-shaped chamber of thin brass, under the mouth of which is placed the top of the lamp chimney, leaving space for draught. The heat of the lamp soon makes the brass intensely hot, and the heated air in the cylinder rising, gives place to the cold air drawn in, which, in turn, becomes heated and rises, thus making a continual current, which forces all the air of the room into contact with the hot metal. The heater may be seen in operation during the Fair, on the right of the fountain, near the office of the FAIR PRESS, and is well worthy of examination.

A CURIOUS CUSTOM.—Nearly all the papers published in the upper portion of this State, have a fashion of stating, when any of their editors come to San Faancisco, that they "have gone below," leading to the inference that this beautiful city by the sea, was a sort of infernal region.

FANNY FERN says: "If one half of the girls knew the previous lives of the men they marry, the list of old maids would be wonderfully increased." Whereupon the Boston *Post* asks: "If the men knew what their future lives were to be, wouldn't it increase the list of old maids still further?"

SUPPLIES ALL

EASTERN PERIODICALS

By the Year, Month or Number

Woodworth Planers,

PLANERS AND MATCHERS,

With patent expansion, feed gear and other improvements, made at Worcester, Mass., in the most finished and substantial manner; also every description of Richardson, Meriam & Co's, Smith's and Wood's celebrated

Wood Working Machinery.

Embracing Mortising, Sash and Moulding, Smith's Stickers, Slat and Door Tenoning, Boring, Shaping, Scroll Sawing, Planing, Rod and dowell making and Re-sawing Machines, Wood and Engine Lathes, etc., for sale at Eastern prices, at the Machinery Depot of

BERRY & PLACE,
112 and 114 California st., San Francisco.

☞ Agents for Blake's Patent Steam Pump, (warranted the best in the market); Onvis & Furber's Wooden Machinery, etc. Being the selling agents for most first class Eastern builders, millmen and others in want of Machinery can save money by giving us a call. Illustrated Catalogues sent free.

Fire Without Smoke or Sparks.

Of all the thousands of people who have visited the Fair, there is probably not a tithe who have stopped to consider the importance of the fuel used in generating the steam which runs all the machinery in the mammoth building. While almost everybody is aware that the particles of soot which were so numerous and disagreeable at all the provious Fairs, are absent at this ono, few seem to care about finding out the cause of such a great improvement, which arises from using petroleum for fuel, instead of coal or wood. There is no other featuro of tho Fair which possesses so many points of economic importance as this petroleum fuel, which makes a fire without smoke or sparks—an immonso advantago when used by locomotives which pass through ripo grain fields during the summer months.

It is not our purpose to write a laudatory article on this petroleum fuel; what we aim at is to attract general attention to its importance. The consumption of petroleum on this coast, where coal is so dear and wood scarce, is of almost as much importance to manufacturers, as tho introduction of a new and effective motivo power; because it will make the expense of generating steam but a fraction of the present cost of fuel, labor and attention, as the fire feeds itself, and requires no labor.

The material used is the crude petroleum, which exists in exhaustless abundance in thie State. Its combustion is secured by an apparatus, the whole cost of which is only $25, and may be affixed to any boiler now in use at an insignificant expense. The whole secret of the process of converting this useless material into one of the best of fuels, is the adding of superheated steam to the ignited petroleum, which causes the oxygen of the water to combine with the excess of carbon in the fuel, and insures so complete a combustion that smoke or sparks are impossible, while the heat is steady and intense. The prineiple is just as simple as that of the common petroleum lamp used in almost every house, in which the oxygon of the atmosphere is made to combine with the carbon of the coal oil by the aid of the glass chimney, which acts as a reservoir for the two elements—a fact domonstrated by the thick black smoke that rises when the chimney is removed, because there is no opportunity for the elements to combine. In the petroleum furnace the jet of steam serves the same purpose as the glass chimney of the lamp, and insures an equally total combustion of the carbon. We recommend every visitor to the Fair to examine this very important invention, which produces fire without smoke or sparks.

CRAIG'S GLOBE NOZZLE MADE TO WORK. The difficulty in turning the globe in any required direction, when filled with water at a heavy pressure, has hitherto presented an important objection to its general use. This fault, says the Nevada *Gazette*, has now been entirely overcome. The North Bloomfield Gravel company have ordered two globe nozzles of the Messrs Craigs, which are to be cast at the Nevada foundry. These are to he thirty inches in diameter inside, and under a hundred and sixty foot pressuro each will be able to pass from 800 to a 1,000 inches of water through a seven inch nozzle. Marselus & Maltman, have ordered one huge globe for the Manzanita elaims. The amount of water these large ones are capable of discharging under a heavy pressure will be an increase of concentrated hydraulic power beyond anything that has yet been used in deep gravel mining. The Craig brotbers have orders from Nevada and Placer counties for eight more of their thirty inch globes. In one claim at Dutch flat this globe is to he used under 350 inches of water.

THE location and surveys for the East River bridge, at New York, have been made. It will be three years before the towers and cables are completed, and six before the entire work is done.

THE NAME.—Why was tho name of "Kelley's Amerioan Washing Flnid" changed? has freqnently been asked. The artiolo is so good, why ehango the name? Simply this, as has happened before: Two persons, in different localities, are seeking for the same invention at the same time, entirely unknown to each otber, and unaware that any one is striving to accomplish the same purposo. Madame Balcear applied for her patent three weeks prior to Kelley, and snceeeded in getting a patent for the same thing; and the preseut proprietors were obliged to negotiate for the patent which covers the fluid they now manufacture, as at first. Moral to inventors—Hurry up and complete your inventions, as others unknown to you may he on your track.

Get Your Engravings

Made at the office of the MINING AND SCIENTIFIC PRESS in season for printing your circulars for the Mechanics' Institute Fair. Remember, a good engraving cannot usually be made in a day.

Parties who wish first-class wood cuts and electrotypes for illustration in newspapers, pamphlets and trade circulars, should call at once and examine specimens.

DEWEY & CO.

American and Foreign

Patent Agents.

No. 414 Clay Street,

SAN FRANCISCO.

Patents Obtained Promptly.
Caveats Filed Expeditiously.
Patent Reissues Taken Out.
Assignments Made and Recorded in Legal Form.
Copies of Patents and Assignments Procured.
Examinations of Patents made here and at Washington.
Examinations made of Assignments Recorded in Washington.
Examinations Ordered and Reported by TELEGRAPH.
Rejected Cases taken up and Patents Obtained.
Interferences Prosecuted.
Opinions Rendered regarding the Validity of Patents and Assignments.
Every Legitimate Branch of Patent Agency Business promptly and thoroughly conducted.

Volunteer Compliments.

From an endless series of appreciative testimonials and frank acknowledgements, we give the following:

"TIDAL WAVE" OFFICE, SILVER CITY, }
IDAHO TERRITORY, July 27th, 1869. }

MESSRS. DEWEY & CO.—GENTLEMEN:—Allow me to express my high appreciation of the ability and business management of the Mining and Scientific Press Patent Agency, and to say that our business relations have been marked with the utmost promptitude upon your part and with entire satisfaction upon mine.

Yours, etc., JNO. S. BUTLER.

MARYSVILLE, CAL., August 13th, 1869.

MESSRS. DEWEY & CO.—GENTS:—Enclosed find $20 (currency) for last fees on patent for gang plow. I am very much surprised, after opinions received from Munn & Co. I am, respectfully, yours, F. A. H.

The original of the above letter (and many others with similar reference to other agencies) can be seen at this office, in cases for which we have secured patents for inventors who had been denied patents, or who had paid for being told that they could not obtain patents. Inventors on the Pacific coast are fast learning to patronize first-class home agents, who better understand their cases and will give more thorough attention to every invention entrusted to their keeping.

DEWEY & CO.,
U. S. and Foreign Patent Agents.

SOMERSVILLE, CAL., August 25th, 1869.

MESSRS. DEWEY & CO.—Dear Sirs: Allow me to return you my thanks for the very able manner in which you have conducted the business entrusted to your care. You will please forward the document (British Patent) by Bamber's Express to this place. Yours, respectfully,
GEO. HAWKHURST.

JAMESTOWN, Cal., July 6th, 1869.

MESSRS. DEWEY & CO.—GENTLEMEN:—The Patent for our Ore Washer and Concentrator was duly received by express. We return you our thanks for the promptness and successful manner which have attended your efforts in our behalf. Yours, WM. G. HESLEP.

SUISUN CITY, Cal., June 26, 1869.

MESSRS. DEWEY & CO:—This is the third time you have presented me with Letters Patent within twelve months. Gentlemen, you have done all I have asked of you—you have been honest; you are men that an inventor can rely upon for doing business for him, and he need not fear of being swindled or wronged in any way. I would give you business to do in your various departments in preference to any one else. Many thanks to you for your success. You have obtained valuable patents for me, and I appreciate your kindness, your honesty, ability and success. Yours, RICHARD KNOTT.

THE RIGHT STAMP!—One of our wide-awake California inventors (who has already received two patents through this office) evinces the true winning spirit in the following note:

SAN JOSE, Cal., June 29, 1869.

MESSRS. DEWEY & CO:—A few days ago I received your letter apprising me of the rejection of my case, etc. Well, under the circumstances, I will just say, "*Let 'er rip!*" and I will remember the indefatigable Zack. Taylor's advice to his soldiers—"Pick your flint and try it again." I will have to try and get even on something else. I am satisfied you have done your duty as agents. Yours, J. F. C.

New Mining Advertisements.

Alleghany Consolidated Gold Mining Company, Sierra County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fourth day of September, 1869, an assessment of thirty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the twenty-fifth day of October, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifteenth day of November, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, 37 New Merchants' Exchange, California street, San Francisco. sep25

Eveolng Star, No. 1, Silver Mining Company. Location of Works: White Pine District, White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fourth day of August, 1869, an assessment of ten (10) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 302 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-third day of September, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday, the fifteenth day of October, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.

Office, Room No. 6, No. 302 Montgomery street, San Francisco, Cal. au28

POSTPONEMENT.—The day for deeming stock delinquent on the above assessment is hereby postponed until Saturday, the second day of October, 1869, and the sale thereof until Friday, the twenty-second day of October, 1869. By order of the Board of Trustees.

se25 WM. H. WATSON, Secretary.

Rippon Gold and Silver Mining Company.—Location of Works: Silver Mountain District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of September, 1869, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, N. E. corner of Fifth and Howard streets, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twentieth day of October, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the sixth day of November, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. F. BERNARD, Secretary pro tem.

Taylor Mill and Mining Company.—Location of Works: Georgetown District, El Dorado County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fifth day of August, A. D. 1869, an assessment of twenty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 520 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the fourth day of October, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the twentieth day of October, 1869, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Trustees.

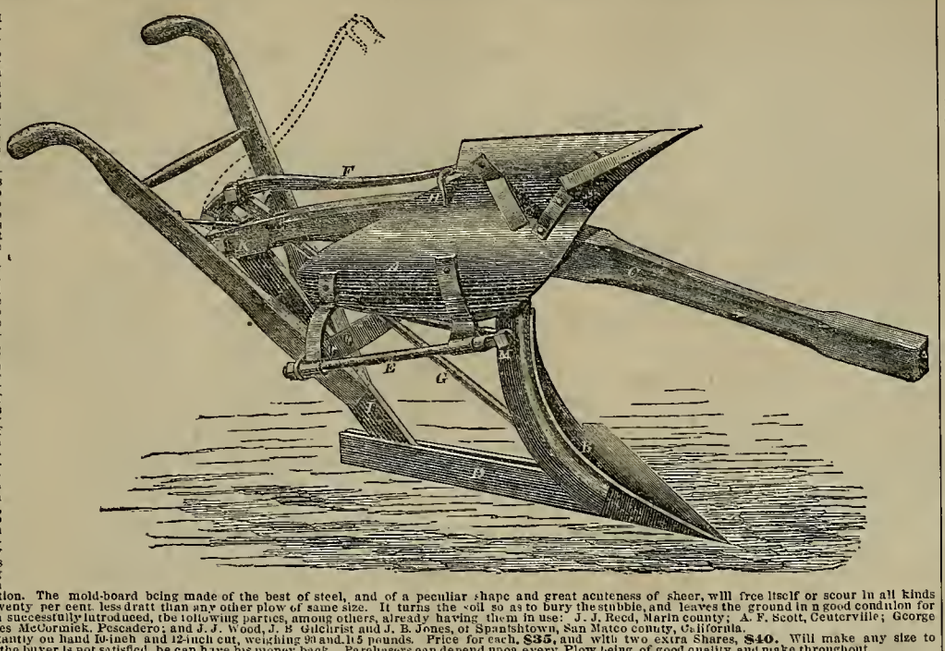
SAM'L S. MURPEY, Secretary.

Office, 520 Montgomery street, over Sather's Bank, San Francisco, California. au28

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low jly17tf

Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

SCOVILLE'S CLIMAX SIDE-HILL PLOW.



The advantages claimed for this new Patent Californian Plow over others employed for similar work, consist in its being so constructed that the plow which is not in use is thrown up in such a manner as to rest its weight upon the beam, as shown in the engraving, where the plow, A, is firmly held by the hooks upon the end of the iron arm, F. The weight of the upturned plow is thus made to aid in keeping the opposite plow to its work in the ground, while the balance of weight is so equally divided as not to give an excess on one side. Its position is also such that it does not in any way interfere with the plowing, and the person who holds the plow can see to handle it as readily as though the mold-board was not resting upon the beam. The handles are so arranged as to give to the holder a sure and easy control of the plow. The rod, G, is operated by the arm or lever, F, so as to lock the plow to be used in its proper position in the standard, by entering a slot in the toe of the land-side, D. When it is desirable to use a single plow (as on level ground) either of the mold-boards may be quickly removed by loosening the nut, M, and removing the rod, E, thus converting it into a single plow. The mold boards are hung upon two angularly placed axles, one of which belonging to the plow not in use is shown at E, with its mode of attachment to the axis. The plow may also be used double, as for ditching, etc., by slipping a cap over the joint of both plows when in proper position. The mold-board being made of the best of steel, and of a peculiar shape and great acuteness of sheer, will free itself or scour in all kinds of soil, and requires fully twenty per cent. less draft than any other plow of same size. It turns the soil so as to bury the stubble, and leaves the ground in a good condition for seeding. This Plow has been successfully introduced, the following parties, among others, already having them in use: J. J. Reed, Marin county; A. F. Scott, Centerville; George W. Sbade, Watsonville; James McCormick, Pescadero; and J. J. Wood, J. B Gilchrist and J. B. Jones, of Spanishtown, San Mateo county, California.

TWO SIZES kept constantly on hand 10-inch and 12-inch cut, weighing 90 and 105 pounds. Price for each, **$35**, and with two extra Shares, **$40**. Will make any size to order. If, after a fair trial, the buyer is not satisfied, he can have his money back. Purchasers can depend upon every Plow being of good quality and make throughout.

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

(including High and Low Mortars, for wet or dry crushing) Furnace Irons for Roasting Ores; Freiberg Barrels, Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

Mechanical Wonders—Their Simplicity.

[From the Mechanics' Fair Daily Press, of Sept. 20th.]

We no longer consider steam as a substitute for muscle wonderful, but we are not sufficiently aware of the extremely simple method of its operation. One of the best examples of the beauty and efficacy of inventions that could be referred to in the Fair, may be seen in working condition this evening at the place in the machinery department occupied jointly by A. Williams with his Douglass Brick Machine, and E. Squires, with his little one-horse power engine, driving the former. Squires is an apprentice in the Vulcan Foundry; he made his entire machine out of work hours, and it is a bona fide one-horse engine that will do more work than any one horse can do. The brick machine takes the raw clay, pulverizes it dry, and makes from 20,000 to 40,000 pressed brick out of it in a day, the work, if we remember rightly, of about forty men. Squire's machine is for sale at $125, a very moderate price.

CHEAP GAS.—Among the various inventions for saving expenses, on exhibition at the Fair, the apparatus for making gas with sulphuric acid deserves special attention. The apparatus which generates the gas used by Root & Nye's superb collection of lamps and gaseliers, in the Music Hall affords a clear illustration of the compactness and simplicity of the arrangement. An apparatus not much larger than an ordinary water-pail being sufficient to furnish gas for lighting every room in a three-story building. The gas is generated by the action of sulphuric acid on iron filings, and can be made by any person at a cost not exceeding $2 per thousand cubic feet. Such an invention is of great importance to this State, where gas is so costly.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the office, **229** Fremont street,

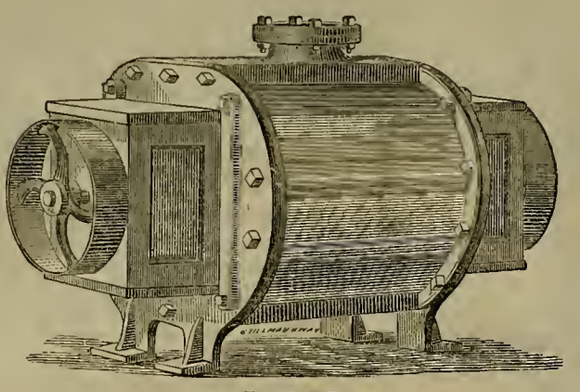
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

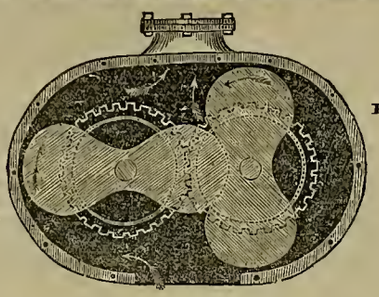
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.



Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

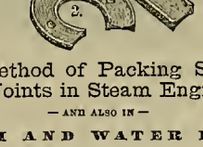
The Most Important Invention of the Day.

HALL & LEE'S



New Method of Packing Stationary Joints in Steam Engines,

—AND ALSO IN—

STEAM AND WATER PIPES.

BY THIS METHOD OF PACKING THE JOINTS ARE made perfectly steam-tight inside as well as outside, thereby effectually preventing the steam from cutting into the joints of the steam chest. Consequently, an Engine packed after this method will last twice as long as it will when other Packing is used; and the joints may be opened and closed every day, and they will be steam-tight every time they are closed, and the same Packing will remain good forever. Consequently, owners of mills will make a great saving, both in time and money, by having their engines packed by this method. Patented June 8th, 1869. By permission we refer to A. J. Binney, Supt. Northern California Railroad, and A. D. Starr & Co., Proprietors of the Buckeye Mill, Marysville. State, County and Mill Rights for sale by A. H. HALL & H. T. LEE, Marysville, Cal. 6v19-3m

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

COAL MINES OPENED NEAR HELENA, MONTANA.—Morgan & Enbody are opening a good coal mine near Greenhorn Gulch, close to the Blackfoot road, and within eighteen miles of Helena. Mr. Kemp has been using this coal in half the forges of his shop for more than a month, and finds that it answers all the purposes of a blacksmith—the severest test of the quality of coal. It answers for gas.

Crucibles.

The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of

Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MOROAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. B. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs. A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.
GALLAGHER, WEEO & CO.,
California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

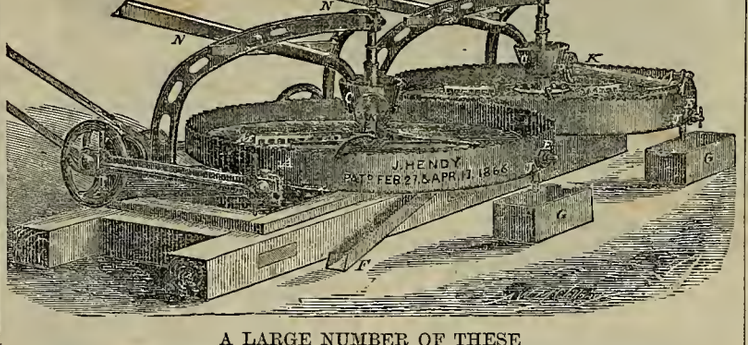
PREMIUM FOR BEST CONCENTRATOR

AWARDED BY THE

MECHANICS' INSTITUTE, 1868,

ALSO AT THE STATE FAIR FOR 1868,

To J. HENDY.



A LARGE NUMBER OF THESE

IMPROVED CONCENTRATORS

ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice. By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

OFFICE OF NORTH STAR MINE, GRASS VALLEY, Nov. 12, 1868.

JOSHUA HENDY, ESQ.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.

Respectfully yours, J. H. CROSSMAN, Supt. N. S. Mine.

J. HENDY, Patentee.

BY DEWEY & CO., Patent Solicitors. SAN FRANCISCO, SATURDAY, OCTOBER 2, 1869. VOLUME XIX. Number 14.

Improved Sewing Machine Needles.

We give herewith illustrations of several alleged improvements which have been introduced into the manufacture of sewing machine needles, having for their object the provision of a more ready manner of threading the needles than by the ordinary way of pointing the thread and poking it through the eye—a slow, tedious operation, and extremely difficult except in a very strong light and with very good eye sight. The first improvement in this direction was patented by Mr. A. J. Ambler, of Chicago, Illinois, March 24, 1863. The eye of this needle is provided with a lateral slot, so beveled as to facilitate the entrance of the thread and prevent its escape, while at the same time no impediment is supposed to be offered to the use of the needle in sewing. Fig. 1 gives a representation, copied from the United States official patent reports, of the manner in which this needle and eye is made. The slot, it will be seen, opens into the eye at right angles with the length of the same.

Fig. 1. *Fig.* 2. *Fig.* 3.

The next patent, in this direction, was issued on the 14th of September last, to Mrs. Hannah G. Suplee, of this city. The manner in which *this* slot is opened into the eye is shown in figure 2. Instead of opening directly at right angles, it is made to pass diagonally upward, as shown. This is drawn by our engraver from the needle itself, and represents the instrument as at present constructed; but there is still another form, slightly varying from this, which is said to be the actual Suplee patent. The claim, which is for the combination of parts, reads as follows:

"I claim the within-described needle for sewing machines, having a slot or opening, *A*, from the eye, with points *c* and *d* and projection *b*, substantially as and for the purpose set forth."

The next improvement is represented by figure 3, and is the invention of Mr. John L. Boone, of this city. The manner of construction and mode of threading this needle is very distinctly shown in the engraving—the thread being inserted by springing the point, as shown, so as to open a split which communicates with the eye, and which closes immediately after the thread has entered.

The split on the side extends from below the eye to some distance above the eye, and when threaded, the finger thus formed presses against the body of the needle as a spring, imparting strength and forcing the point of the finger in, so as to avoid any liability to catch in the fabric while passing through.

It appears to have decided advantages over either of its predecessors—especially as regards strength and the facility with which it can be made to pass through the most delicate fabric. Application for letters patent for this invention has been made at Washington, and foreign patents are being secured by the inventor.

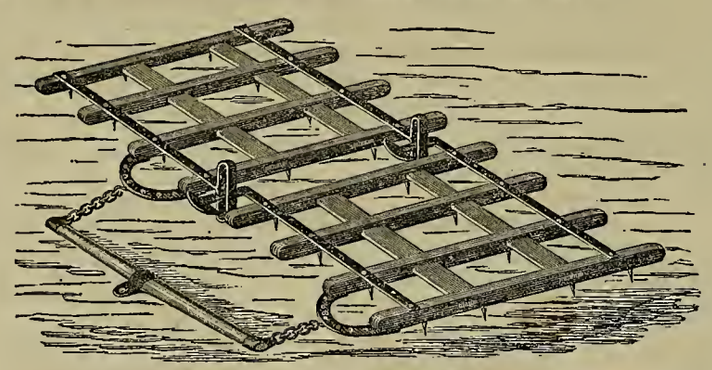
TALKED ABOUT.—It is found not so easy to start a grand Pacific Ocean excursion—to Mexican and Hawaiian ports—as it is to get thousands to pronounce themselves enthusiastically in favor of the idea. But now is the time to make it known if persons really desire to go; for the interest as well as possible pecuniary advantage belonging to a pretty thorough canvassing of the resources and the actual status of the western States of Mexico, and of the fertile tropical slopes of the Sandwich Islands, are apparent. The North Pacific Transportation Company have had a proposition for such an excursion under consideration, but thus far without having fully determined in regard to it. Probably it will fall through, as excursions are apt to do. But a wholesale visiting to those shores by energetic and wide-awake Californians, would be a godsend to the countries named, and could not fail to be a satisfactory trip to the individuals.

CLASSIFICATION.—The following is the very simple system of classification adopted by the American Institute: 1, Arts and Education; 2, Department of the Dwelling; 3, Trades and Handicraft; 4, Chemistry, Mineralogy, Mining; 5, Engines, Machinery; 6, Intercommunication; 7, Agriculture. These subdivisions are meant to include everything that *is*. The Paris Exposition had 100 classes, in groups. Our own classification this year into 21 subdivisions, is comprehensive and excellent.

S. H. H., will please send us word where we can address a letter to him.

Brown's Challenge Harrow.

We give herewith a pictorial representation of an improved harrow recently patented through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, by Messrs. T. A. and T. S. Brown, of Brooklyn, Alameda County. This harrow is of that class called double harrows, which consists of two harrows joined together so as to form one, and its novelty and improvement consists in the manner of uniting the two. Harrows are made double, with flexible joints, so as to permit a more independent movement, each of the other, and to allow them to more freely accommodate themselves to the inequalities of the ground over which they pass. The difficulty heretofore encountered has been to devise a proper connection between the two harrows, so that each would perform effective work. That object appears to have been fully accomplished in the device herewith presented.



T. A. & T. S. BROWN'S CHALLENGE HARROW.

Referring to the engraving, it will be seen that iron bars run across each of the harrows, at the front and rear. The bars upon both harrows project and overhang upon their inner sides. The overhang of the bars upon the "near" harrow, consists of an elbow with a cross head. The overhang of those upon the "off" harrow are made to form a loop. When the harrows are to be connected, they are placed at right angles to each other, when the heads of the one may be easily entered within the loops of the other. When the harrows are so joined and placed in position for work, as here shown, they cannot be separated. It will readily be seen that by this device, while a firm union is effected, each harrow is allowed an independent motion back and forth on the ground, equally to the length of the loop; thus greatly facilitating the process of harrowing, by allowing each harrow to accommodate itself to the unevenness of the ground, thus effecting a more thorough pulverization of the soil than could be effected by a single rigid harrow. These harrows have been in use in Alameda County during the last season, giving the fullest and most unqualified satisfaction. State, county and farm rights for sale. All letters for information should be addressed to Messrs. T. A. and T. S. Brown, Brooklyn, Alameda County, Cal.

Shipping Ores to Europe.

Along the line of the railroad since its opening, quite a business has sprung up in the way of shipping ores to Europe. So extensively is this being entered into, that it is thought our exports in this line, will exceed that of any previous year.

Any feature which tends to give life to the mining interest, is certainly acceptable and to be encouraged; at the same time we regard this shipping of gold and silver ores to Europe, as quite a reflection upon ourselves.

We boast of our metallurgical skill and twenty years' experience, with facts such as this staring us in the face. Now if we have so much skill and so much experience, why not work these ores at home? Labor expenses cannot be set up as the reason; since freight, with discounts, sampling and assay charges, per ton, in every instance, exceed the difference in the cost of labor.

The great point to be obtained in all our industries, is to keep our gold and silver at home. By working these ores here, we make the first important step towards it, besides giving employment to large numbers of our own people.

If our systems are imperfect, then let us remedy the defects. That such ores are worked successfully in Europe is a settled fact; and to say by these shipments we cannot work them, is admitting more than, in justice to ourselves, we desire to see.

We do not wish to be understood as throwing any discouragement upon shipping, if it pays best to do so; but we certainly desire to see our miners exert themselves to do away with this necessity, by making it *more* profitable to work these ores here,—especially those of gold and silver, and perhaps copper as well.

The number of skilled metallurgists among us who have had European experience, if you please, as well as our own native workers, warrants us in saying, that we can work our own ores if we will only set about it judiciously and in earnest. As before observed, our prosperity consists in giving employment to our own people, and in keeping our gold and silver at home. Let us apply this principle to our ores as well as to other things.

REPORTS OF THE AMERICAN INSTITUTE. The American Institute sends out every year fifteen thousand copies of a volume of thirteen hundred pages, consisting of papers read and oral statements made at the meetings of that body. Accessible printed matter containing such figures and details as cannot be retained in the memory, is of the greatest importance to engineers, and even to farmers and others who undertake to do thoroughly whatever they may have in hand. The American Institute Reports constitute, besides, a complete library of American science and discovery.

Mechanical Progress.

Aero-Steam Engines.

Mr. George Warsop's combined steam and air engine is attracting a good deal of attention in England. *Engineering* notices it at length; and we take from that journal the following detached portions of an editorial upon the subject:

"Briefly stated, Mr. Warsop's plan consists in fitting an engine with an air-compressing pump, this pump forcing ordinary atmospheric air through a coiled pipe, which is exposed to the action of the exhaust steam and to the hot gases in the boiler flues, and from which it is finally delivered into the lower part of the boiler, and allowed to pass up through the water and mix with the steam in the steam space. We may premise that, although results show that a very decided economy has attended the application of the combined air and steam system to the engine on which the experiments have been made, yet we do not believe that an equal economy is likely to be obtained by the application of the system to engines of better construction. That the system, however, gives promise of a degree of economy quite sufficient to entitle it to the careful consideration of engineers, the experiments already made clearly show. So far as the experiments yet made enable us to judge, the beneficial results obtained under the combined system of working are due to four causes, namely: first, to the air acting as a heat-carrier from the exhaust steam and waste gases into the boiler; secondly, to its promoting circulation in the boiler; thirdly, to its, to some extent, checking condensation in the cylinder and steam passages; and, fourthly, to the fact of air forming a more economical motive fluid than steam. Now in the case of engines supplied with steam at, say 110 or 120 lb. per square inch, and fitted up on Mr. Warsop's principle, the heat generated by the compression of the air would be so great that the temperature of the latter would be raised not only above that of the exhaust steam, but also above that of the waste gases in the boiler flues; and it would thus be rendered incapable of acting as a heat-carrier. Again, in proportion as the cylinder and passages are protected by steam-jacketing, careful cleaning, etc., the value of the air as a preventive of condensation decreases, and in the same way its value as a promoter of circulation in the boiler becomes of less value in proportion as the boiler is of good construction. We now come to the fourth source of economy, namely, the efficiency of the air as a motive fluid, and here we again find that high pressure and high degrees of expansion are inimical to the success of Mr. Warsop's plans."

Electric Communication between Railway Passenger and Guard.—Mr. S. A. Varley read a paper before the British Association at Exeter, Eng., describing a system of signalling on rail-cars in use on the North-Western Railway. *Engineering* gives an abstract of this paper. We quote: "An insulated wire ran along under the carriages which communicated with a battery in the guard's van, and another on the engine. Two insulated wires from each compartment were connected with the one under the carriages, and these were attached to a handle in each compartment. This handle, on being pulled out (and which would not again go back without a key), set the electric apparatus in motion, striking a bell in the guard's van and on the engine, which would not stop ringing until the handle pulled by the passenger raising the alarm was put back in its place by the guard in possession of the key for that purpose. The insulated wire running under the carriages was in reality seven wires in one coil, which were covered with a flexible material, and not likely to break on going round curves. No electric knowledge was necessary in testing the system, as all the operations are purely mechanical. The batteries continue to work two or three months without attention, and warning of any failing is given by the fainter working of the bell."

To Fasten Leather to Metal.—A. M. Fuchs, of Bairére, steeps the leather in an infusion of gall nuts; and a layer of hot glue being spread upon the metal, the fleshy side of the leather is forcibly applied to it. It must dry under pressure. The leather will be torn sooner than separate from the metal.

Repairing Castings by "Burning On." The *American Artisan* says it is surprising that this plan is not more generally understood and oftener resorted to. It is in many cases perfectly efficient. We quote: "With large castings, the portion to be repaired is first heated until it approaches the melting point. The surface should then be coated with a borax flux, and molten metal directed in contact with it until the melting of the surface is well under way, which can be ascertained by probing with an iron rod. The mold of the part to be added being properly arranged, the molten metal is caused to flow into it, being at the same time in contact with the melting surface of the casting. When the whole has become cool, provided the operation has been carried on with the requisite care, the new portion will be found homogeneously united to the original casting."

The "Celeremane."—*Engineering* for September 3d describes and illustrates a new vehicle with the above name. It is a sort of velocipede carriage worked by four men, who sit and pull like rowers. The steering is done by a coxswain at the stern, who has an elevated seat like a coachman's, and handles a pair of ordinary leather reins attached to the forward axle,—one near each wheel. The rear wheels are the drivers; a steel cross-bar on the outside serves as the crank, from which a connecting rod leads to the frame worked by the rowers. A speed of twelve miles an hour is easily kept up.

A French Revolution in Steel-Making.—The Paris *Presse* notes an experiment made by M. Berard, an engineer, in presence of two eminent scientific gentlemen. The account closes thus: "The product obtained by his process, proved to be steel of good quality. The operation was effected in a reverberatory furnace, lasted about an hour and a half, and was accomplished with as much facility as puddling. In this process, from 6,600 to 11,000 pounds of metal is made by one operation into steel ingots ready for the workshop. We will be much deceived if this invention has not in it the germ of a complete revolution in metallurgy."

Percussion Caps.—"The shells are taken, quarts at a time, and shaken upon a long steel plate, perforated with little holes, each of which receives one cap; then a handy little machine deposits a single drop of varnish at the very bottom of each; then fulminate of mercury is placed on the plate and swept with a soft brush very carefully into the shells, which are next dropped into tubes, all right side up, and finally subjected to the action of another machine, which rams down the charge in each cap."—*Artisan.*

Novel Blasting.—The Oswego, N. Y. *Times* describes an experiment lately made in that city in the way of blasting by means of gas. "An excavation was being made for a tank at the gas works. An old well had been pumped out and filled up, leaving an open space at the bottom. Into this space gas was introduced, sufficient to make an explosive compound with the air. This was touched off by a match trigger, when a general upheaving of the earth took place, loosening up the soil and making digging easy."

New Roofing Tiles.—Tiles of galvanized iron, each fastened by a single nail of the same material, with a leaden washer, and thin, so that they can be easily cut to fit corners, etc., have been introduced in France.

Railroad Frogs.—Armstrong & Co.,—says an English exchange,—have patented a frog composed of a cast-iron bed plate with a working face of cast-steel. This steel facing is not riveted or bolted on, but in the process of manufacture the two metals are incorporated, and the frog is complete in one casting.

Scientific Progress.

The Solar Corona.

Prof. Young, of Dartmouth College, whose happy determination of first contact, in the late eclipse, by means of the spectrum of one of the solar prominences, we made reference to in our last issue, gave special attention also to the observation of the corona. In a letter to Prof. Morton, after his return from Burlington, Iowa, the place of observation, he says: "Perhaps I am too bold in my conclusions, but at present I feel persuaded that the solar corona is a permanent aurora." This conclusion was based upon the correspondence of his principal corona lines with certain aurora lines of Huggins. Prof. Morton refers to this in an interesting article published in the *Journal of the Franklin Institute*, for September, giving, in anticipation of the official publication, the results of the observations made by the Philadelphia Photographic Expedition, of which he had charge; and after noting other significant points in the same connection, adds: "It would thus seem almost certain that the corona is simply an electric discharge, no doubt varying with great rapidity, as we see in the case of the aurora; and to its variations we may attribute those apparent motions of the prominences which have been observed by so many, but which our large series of photographs shows not to have had any actual existence."

Descent of Glaciers by Gravitation. In opposition to the position taken by Mr. Moseley, James Croll, of the Scotch Geological Survey, supports the theory that gravitation alone is sufficient to account for the descent of glaciers. "Each molecule descends step by step as it melts and solidifies, and hence the glacier, considered as a mass, is in a state of constant motion downward." Upon this theory, he considers the origin of crevasses perfectly explicable; as also the fact that glaciers move more rapidly in summer than in winter. As for the denuding power of a glacier, it depends not upon the ice, but upon the stones and sand forced along under it; and the grinding effect of a glacier descending with a given velocity must be the same whether its motion be molecular, or of the kind generally supposed."

Dr. Hayes Among the Icebergs.—A letter from William Bradford, the artist of the expedition, dated Ivigtut, Greenland, July 27th, describes the *Eisblinken*, one of the largest of the glaciers, which is constantly discharging immense icebergs into the sea, the whole shore of which is lined with them. He says: "The sea is dotted with these great white floating islands, which are often from one to three hundred feet high. In a single view I have seen many hundreds. We were fortunate enough to witness seven bergs discharge in the manner first described, I believe, by Dr. Hayes; and although we were at one time exposed to some danger, and lost a part of our photographic materials by the wave which rolled thirty feet high upon the rocks, yet all of the party escaped without personal accident. The photographic party heard the crash and saw the wave coming in time to climb the rocks, and thus escape being washed into the sea, meeting with no further mishap than a good ducking from the crest of the sea. It was a narrow and providential escape. I was on the vessel at the time, making a study in oil of the glacier front, which is two hundred feet high, and had we been nearer to the shore, we should have been in all probability, dashed to pieces."

Father Secchi on Electricity.—"I believe that the true theory of electricity will result from the principle that electricity is not a motion *(mouvement)*, but a change of the quantitative and dynamic equilibrium of the ether which constitutes the atoms of the substances, and that the propagation of such a change is brought about by the moving of the ether from one atom to another; this motion shakes, disturbs the ether of the atoms, and thus produces heat."

The Alabama Meteorite.

Prof. Brush gives in *Silliman's Journal* for September, the description of the aërolite which fell last December in Franklin County, Alabama, and which has been sent him for examination. It was seen to fall by Mr. James Hooper, who picked it up while still warm. It weighs 1 lb. 9½ oz. A representation of it is given, drawn half the size of the stone. The result of the analysis is given. Prof. B. closes this with these words: "From this composition it would appear that the mass is probably made up of uni- and bi-silicates. In a preliminary analysis I found that more lime was contained in the acid solution than in the portion undecomposed by acid, while with the magnesia the larger amount remained in the insoluble residue. The silicate decomposed by acids containing lime is most probably either anorthite, labradorite or a lime-olivine. The large portion of magnesia and iron insoluble in acid indicates the presence of a pyroxenic mineral. Further investigation is needed to fully establish the specific character of the constituent minerals of this meteorite, although we are justified in concluding that it contains an olivine, a pyroxenic mineral and a feldspar, besides chromite, troilite and a very small amount of nickeliferous iron. I think by sacrificing a large portion of this stone that its constituent minerals could be mechanically separated from each other by careful selection with the aid of a magnifier, and their specific characters accurately determined by analysis. At present I do not feel at liberty to undertake this, but hope at some future time to return to the study of this problem."

Arborescent Marks Produced by Lightning.—Dr. Richardson, in his experiments with the great induction coil, at the London Polytechnic Institution, found that arborescent marks may be produced on the bodies of persons struck by lightning—a fact which has been discredited by scientists. The popular opinion in regard to these marks has been that they were the images of trees photographed upon the skin by electrical agency. The experiments of Dr. Richardson confirm the production of the marks, but show that, instead of being images of trees or plants, they are the superficial tracings of blood vessels, which the electric current has followed on account of their greater conductivity.

For Photographers.—Professor Morren calls the attention of photographers to the property of intercepting the chemical rays without stopping the luminous ones, which is possessed by a screen of bisulphate of quinine well filtered and confined by means of gutta-percha between two glass plates. This screen is five millimetres in thickness. It is very much to be preferred to the yellow glass, which gives everything such peculiar colors as to require a special training of the eye in order to properly note the reactions.

Regeneration of Limbs.—M. Milne-Edwards has communicated to the French Academy some experiments on this subject. It had been shown that the amputated limb of a newt would be renewed if the scapula be not removed. The new experiments were upon fishes. If the part corresponding to the scapula be removed, it was found that no reproduction would take place. Otherwise, however, the fin would grow again.

Transit of Venus in 1874.—The French astronomer Royal has already fixed upon the stations for observation. They are Oahu, (Sandwich Islands), Kergnelen Island (in the Indian Ocean), Rodriguez (a dependency of the Mauritius), Auckland (New Zealand), and Alexandria.

Insulation of the Cable.—The insulation of the Brest and St. Pierre cable is already more than double, by measurement, what it was when first laid. The improvement is believed to be mainly due to the diminished temperature.

Slate Quarries as an Investment.

The present, and the first public exhibition in this State of the products of our slate quarries, (by Mr. Robinson, of the California Slate Company, whose quarry is in Copperopolis) is eminently suggestive of what this new business may in time become. The attention of the public being once interested in this direction, will induce many others to look into the business, and a free supply of the product can scarcely fail to greatly extend its use and demand. Few have any idea of the large fortunes annually made out of this branch of industry in Great Britain. The slate quarries of that country are mostly confined to North Wales, and some of the quarries there divide annually from two to three hundred thousand dollars. There is one quarry which has been profitably worked for over fifty years, and which was sold some three years since for $600,000. This has also become an important and profitable business in the Atlantic States. This class of investment is attended with but little risk—not a tithe of that incident to mining for the precious metals, or for copper or tin. The color, cleavage and grain of the California slate, appears to be all that is desirable, and we presume that it will not be long before the quarry proprietors will find it to their advantage to erect extensive sawing and dressing machines. There is already a second quarry opened, not far from the one which is now making such a fine exhibition of its products at the Pavilion.

A Useful Device.—Mr. M. B. Bullard, of 637 Market street, exhibits a very useful addition to the ordinary cooking stove, which is known as Perkins' Revolving Extension Stove-Pipe Shelf. These shelves are attached by a simple contrivance to the pipe above the top of the stove, at any desired elevation, and are used for warming plates or to keep the dishes of food warm for the table; thus avoiding the clutter upon the stove top or hearth. They may also be used for a great variety of other purposes—as for drying fruit, for drying or airing linen, etc., for which latter purpose extension rods are affixed to properly devised loop-holes, after the manner of the horizontal clothes-dryers. These shelves have been extensively introduced at the East, where they are considered great conveniences. They are ornamental in design and construction, and readily commend themselves upon sight to every housewife. They may be seen in the further corner of the machinery department of the Pavilion, where Mr. B. stands ready to explain their use.

The Oriental Coffee-Pot.—Mr. A. C. Taylor, one of our well known pioneers, exhibits an improved coffee-pot, under the above name, with milk heater attached, which combines all the essential features of the Old Dominion, Grecian and French coffee-pots, but which is used precisely after the manner of an ordinary pot for boiling coffee. It has no machinery or clap-trap of any sort attached, to be continually getting out of order; yet does its work well, and will turn out as good a cup of coffee as almost any pot in use. Mr. Taylor also exhibits his well known self-cleansing sewer-trap and slop-hopper, a useful California invention. These devices should be attached to every sink; their general use would add greatly to the health and comfort of families in all thickly settled communities. They received a special premium at the State Fair a year ago, and richly merited such notice. Go and see them. They will be found in the northwest corner of the machinery department, where Mr. T. always stands ready to explain their use and utility.

A Powerful Chorus.—One of the theaters of New York invites the audience to join in singing the chorus to popular songs. There is a flood of sound on such occasions, if tune and time are deficient.

The following notice was found pasted on a large box which passed over the Sioux City and Pacific Railroad: "Baggage smashers are requested to handle this box with care, as it contains nitro glycerine, Greek fire, gun cotton, and two live gorillas." The box was not broken.

Chicago reporters now call a dentist a "tusk-hoister," and a blacksmith a "vulcanist."

OFFICIAL CLASSIFIED CATALOGUE.

Articles on Exhibition at the Seventh Industrial Exhibition of the Mechanics' Institute of the City of San Francisco, 1869.

CLASS I.

Machinery for the Application of Power.

SECTION 1.

Steam Engines, Boilers, etc.

Entry No. of Article.	No. of Article.	
3	3	J. T. Ford, miniature steam engine.
9	9	Geo. T. Pracy, 8-inch engine with fittings.
10	" " "	24 Pracy's governors.
121	153	H. B. Martin, double-acting oscillating steam engine.
183	215	Michael Lawton, model of steam engine.
240	270	Charles O. Farciot, working model of steam engine.
332	384	T. W. Burns, Taylor oil burner, steam generated by crude petroleum, in use under the Pavilion boiler.
336	388	J. W. Bowker, model of improved smoke stack and spark killer.
356	411	Edwin Squires, a one horse-power steam engine.
364	420	Jas. Scrimgeour, model of steam boiler and steam digester.
456	525	David Stoddart, 13 Pickering's engine regulators.
456	529	David Stoddart, model of Gifford's injector.
508	624	Fuller & Co., Johnson's equalizing steam heator.
521	636	John L. Constable, patent steam packing and piston.
533	657	Keep & Bargion, (Stockton) No. 5 Root's force blast blower.
540	665	W. H. Woods, improved steam cylinder cocks.
545	670	P. & R. Wallace, upright engine, (made by exhibitors, who are apprentices in the Union Iron Works).
591	716	L. A. Gould, D. M. Swain's steam alarm water gauge.
592	717	H. S. Smith, set of Dunbar's steam piston packing.
645	784	R. L. Harris, Carvalho's patent steam superheater.
650	821	M. & A. Wilcox, (Sac.) 3 sizes of Wilcox's patent steam water lifters.
651	822	Marsh, Pillsbury & Co., one B. F. Sturdevant's No. 6 blast blower.
651	823	Marsh, Pillsbury & Co., one B. F. Sturdevant's No. 2 blast blower.
652	824	H. J. Booth & Co., one 16-inch hore, 30-inch stroke slide valve, cut-off stroke engine.
594	718	Baker & Hamilton, one 8¼-inch hoisting steam engine.
271	305	Treadwell & Co., one Hoadley's portable steam engine.

SECTION 2.

Hydraulics, Hydrostatics and Pneumatics.

13	20	Ætna Foundry, Hanscom & Co., Hayes' steam pump.
28	39	W. H. T. Clark, Clark's patent pump.
28	40	W. H. T. Clark, metallic stuffing box.
104	133	Berry & Place, 2 of Blake's patent steam pumps.
188	218	A. Myers, (Portland) Leffel's double turbine water wheel.
191	221	Fuller & Co., Bodine Jonval turbine water wheel.
313	363	V. S. W. Parkhurst, 2 champion force pumps.
382	442	Linforth, Kellogg & Rail, Gerrish force pump.
397	463	V. Cushing, 6 Excelsior force pumps.
456	526	David Stoddart, 7 Cameron's special pumps.
456	527	David Stoddart, 2 Sewell & Cameron's fly wheel pumps.
462	548	Baker & Hamilton, Earle's patent steam pump.
512	627	W. D. Hooker, force pump, (California invention).
522	637	Walmsley & Smith, model of a Smith pump, (California invention).
533	658	Keep & Bargion, (Stockton) two globe force pumps.
546	671	N. D. Laswell, two force pumps.
569	689	Walmsley & Smith, Smith's pump, connected with windmill in yard.
590	715	Pacific Pump Manufacturing Company, American submerged pump.
653	825	H. B. Martin, one double-acting oscillating steam pump.

CLASS II.

Machinery and Tools used in the Manufacturing and Producing Arts.

SECTION 1.

Wood and Metal Finishing Machinery.

Entry No. of Article.	No. of Article.	
2	2	J. T. Ford, double hook and eye machine.
8	8	George A. Day, jig belt saw, with swivel table.
9	11	George T. Pracy, 2 lathes.
9	12	George T. Pracy, patent punch.
9	13	George T. Pracy, patent shears.
9	14	George T. Pracy, upright drill.
9	15	George T. Pracy, 4 lathe chucks.
20	30	T. Stebbins, jig saw.
41	52	Pilkington & Lane, Excelsior wood saw.
104	129	Berry & Place, variety wood turning lathe.
104	130	Berry & Place, engine lathe.
104	131	Berry & Place, planing and matching machine.
104	132	Berry & Place, portable drilling machine.
3	4 351	T. D. Young, engine lathe.
364	352	T. D. Young, iron shaping machine.
311	358	Otis Jackson, endless or band saw.
375	433	F. A. Huntington, shingle machine.
378	437	J. Kindleberger & William. A. Arnold, blind shade tenoning machine.
378	438	J. Kindleberger & William A. Arnold, double-acting blind wiring machine.
454	522	William Sellers & Co., (Phila., Pa.) 12-inch shaping machine.
454	523	William Sellers & Co., (Phila., Pa.) 2-inch bolt screwing machine.
462	541	Baker & Hamilton, one medium three-side molding machine.
503	618	L. Castagnino, machine for inlaid work.

SECTION 2.

Miscellaneous Machinery.

14	23	M. P. Hopkins, (Lawrence, Mass.) model of "step for spindles."
15	24	C. P. Traverse & Co., 2 French burr mill stones.
39	51	A. V. Smith, improved store truck.
45	56	J. B. Johnson, model of "Johnson's" patent hoist.
75	92	J. Spaulding, carpet beating machine, "Holm's patent."
77	94	J. W. Sutton, rotation dynamometer.
190	220	D. Simpson, Boston Union gas machine.
213	241	P. G. Willhite, model of Reynold's improvement on flour bolts.
220	248	J. W. Quick, quartz smutter and shaker screens.
298	344	Atwood & Bodwell, 2 Excelsior windmills and one model (working) of same.
310	357	William Lyne, hair picker.
314	365	A. Williams, model of "Douglas" brick machine.
329	381	C. W. Stevens, gas machine.
471	572	A. S. Hallidie, improved grip pulley for conveying power.
475	581	Pacific Straw Works, frame making machine.
542	667	H. J. Booth & Co., lot of wheat and quartz screens.

CLASS III.

Mining, Quarrying and Metallurgy; Machinery and Appliances in connection therewith.

Entry No. of Article.	No. of Article.	
1	1	G. A. Taylor, improved Giant quartz mill.
13	22	Ætna Foundry—Hanscom & Co., cupola and foundry fixtures.
307	354	J. W. Coffey, patent battery shoe and die.
435	501	Thos. Varney, 4 amalgamating pans.
502	617	Risdon Iron Works, 3 shoes and 3 dies for quartz crusher.
516	631	Porter & Collins, Quartz duster.
527	649	W H. Hepburn, amalgamating pan.
530	652	Porter & Collins, quartz crushing machine.
578	783	D. M. Hosmer, model of patent revolving stamp.

CLASS IV.

Agricultural Machinery, Implements and Tools

Entry No. of Article.	No. of Article.	
4	4	W. P. Watson, Portland, gang plow.
6	5	Benj. Harris, stable with patent feed attachment.
6	6	E. H. Willis, 2 cider presses.
13	21	Ætna Foundry—Hanscom & Co., hydraulic wine press.
25	35	John Nestor, Portland, apple-paring machine.
53	63	G. A. Davison & Co., gang plow, California invention and make.
87	106	E. P. Hicks, model of self-opening and self-closing gate.
163	194	Hunter & Wiester, grain separator.
184	216	L. L. Sawyer, Finlayson's seed sower.
219	247	T. Locher, Oroville, working model of steam plow.
267	301	E. C. Bickford & Co., 2 of Packard's patent traction gates for farm and garden.
271	306	Treadwell & Co., 3 of Hutchinson's cider mills.
271	307	Treadwell & Co., potton gin.
271	308	Treadwell & Co., gang plow.
271	309	Treadwell & Co., Powers' seed sower.
271	310	Treadwell & Co., hand seed sower.
280	319	Gustaf Gustafson, patent tree and shrub hox.
283	322	L. L. Sawyer, model of Johnson's patent portable fence.
321	375	Morris, Murpby & Co., gang plow.
334	386	Ives Scoville, side-hill plow.
335	387	A. Williams, rotary harrow.
353	408	F. B. Lamh, vegetable cutter.
367	424	Olpba Bonney, Jr., horse rake.
367	425	Olpha Bonney, Jr., set of grain lifters.
369	427	Richard Knott, Suisun horse power fastener.
369	428	Richard Knott, Suisun, stake puller.
445	513	J. D. Arthur & Son, bent-axle gang plow, 3 cultivators, patent spring double whiffletree.
446	514	O. M. Sherman, 2 models of Rouse's patent step and fruit ladder.
462	639	Baker & Hamilton, 1 fifty-saw cotton gin and and condenser.
462	542	Baker & Hamilton, Sweepstake gang plow.
462	643	Baker & Hamilton, Gem broadcast seed sower and power.
462	644	Baker & Hamilton, Baker & Hamilton's Gem broadcast seed sower for horse-power.
462	545	Baker & Hamilton, Buckeye seed drill.
462	546	Baker & Hamilton, Union mower.
462	547	Baker & Hamilton, 1-cast. cast steel single plow.
477	687	C. W. M. Smith, Turner C. Turrington's improved grape crusher and stem separator.
601	616	E. W. Walton, weed cutter and extra blade.
524	641	M. C. Hawley & Co., Buckeye mower and reaper, with self-rake attachment.
524	642	M. C. Hawley & Co., Buckeye mower, with drop attachment.
624	543	M. C. Hawley & Co., No. 3 Burdick's National hay cutter.
524	644	M. C. Hawley & Co., 2 Deere's plows.
524	645	M. C. Hawley & Co., Peoria plow.
624	646	M. C. Hawley & Co., Collins plow.
536	561	E. Barnes, patent thill attachment.
559	679	D. S. Smith, model of Randall rake.
559	680	D. S. Smith, model of Randall rake, improved.
572	692	Baker & Hamilton, 2 single plows.
572	693	Baker & Hamilton, Gale's feed cutter.
572	694	Baker & Hamilton, Sweepstake horse fork.
677	599	T. S. & T. A. Browu, Brooklyn, Alameda county, field harrow.
532	703	Treadwell & Co., Russell's thrashing machine.
596	719	J. W. Clark, Haywards, Alameda county, grain separator and bluestone mixer.
615	742	L. L. Sawyer, patent cow milker.
629	759	E. B. Hendee, patent trimming shears.
646	784	John Deere, Molino, Ill., 8 assorted plows.
646	785	John Deere, Molino, Ill., walking cultivator.
551	834	H. G. Pratt & Co., 1 Eagle hay press.
663	836	— Hoag, Bloomfield, Sonoma county, one dog power.

CLASS V.

Naval, Military and Civil Engineering and Architecture.

SECTION 1.

Naval Architecture.

Entry No. of Article.	No. of Article.	
15	25	Murdock Campbell, model of a pilot boat.
29	41	George Milledge, model of ship Morning Star.
30	42	Nicolas Castro, model of sloop-of-war Nevada.
123	155	J. F. Fugazzi, model of a Venetian gondola.
126	159	Mrs. M. Carpenter, model of canoe.
161	192	S. F. Cordage Co., Tuhbs & Co., 9 bales of rope, California manufacture.
169	200	Capt. J. Housman, model of a yatch pilot boat.
174	205	John E. Kennedy, model of a propeller screw.
196	225	P. A. Lawson, model of a steamer.
250	282	B. Reiley, set of rowlocks.
308	355	O. T. Stacy, steering apparatus.
365	422	L. D. Herrick, metallic life-boat.
408	475	J. S. Nichols, model of schooner Caroline Mills.
440	508	J. G. Perkins, model of propeller.
471	571	A. S. Hallidie, samples of wire rope, all sizes.
562	682	E. Wakeman, boat with patent detaching gear.
583	704	A. Crawford, 2 patent logs.
583	705	A. Crawford, patent deep-sea lead.
583	706	A. Crawford, patent capstan.
583	707	A. Crawford, patent ship's lamp.
588	712	F. Hansen, model of ship Onward, in glass case.
621	753	A. G. Waterhouse, model steering gear.
13	791	I. E. Thayer, model of schooner and pilot boat.

SECTION 2.

Military Engineering.

26	37	A. F. Potter, Oakland, breech-loading cannon, with box of projectiles.
37	49	Cburch & Clark, samples of pieces of fire-works.
228	256	California Powder Works, samples of blasting, sporting and cannon powder.
351	405	Wm. Rudolph, case of guns, gun locks, sporting articles, etc.
404	470	A. J. Plato, 2 cases of guns, pistols and sporting articles, and 1 cartridge machine.
472	676	W. T. Garratt, 2 brass pounders on black walnut carriages, California manufacture.
674	696	Cranmer & Holden, revolving battery gun.
680	701	S. L. Cutter, samplo of Hafeneggar powder.
656	829	Little & Keading, 2 cases of guns, pistols and sporting articles.

SECTION 3.

Architecture and Civil Engineering.

145	176	J. P. Clay, samplo of pressed brick.
319	370	M. Clark & Co., Sacramento, lot of fire-brick.
319	372	M. Clark & Co., Sacramento, sower and water pipe, and samples of clay.
331	383	Asphaltolin Pipo Co., 9 pieces of asphaltolin pipe.
347	400	Peter Portois, patent earthquake and fire-proof chimney, and patent earthquake-proof brick.
352	406	E. N. Robinson, specimens of roofing slate, flagging, etc.
376	434	P. Martin, cement drainage pipe.
471	670	A. S. Hallidie, Hallidie's patent suspension bridge.
480	689	Benj. F. Freeman, specimens of stair work, consisting of stair rails, posts, balusters, etc.
498	613	— Lynch, Lynch's improved reflector, for cellars, vaults, etc.
617	632	B. P. Rider, Boston, model brick machine.
651	654	Pacific Wood Preserving Co., table made of treated wood; 2 samples of street pavement as they appear when laid; sample of street pavement which has been in drying room of a sugar refinery four months; section of a pile protected against marine worms.
585	709	M. D. Warner, model of Perkins' patent fire-proof ventilated sheet iron window shutter, and door.
35	801	John Daniel, marble mantel and grate.
35	802	John Daniel, 1 Italian statuary marble mantel and grate.

CLASS VI.

Philosophical, Surgical and Dental Instruments

Entry No. of Article.	No. of Article.	
100	123	Warren Holt, terrestial globe.
132	164	Lunberg & Marwedel, case of telegraphic instruments
249	280	A. E. H. Braun, case of trusses.
284	324	John Roach, 1 transit instrument.
281	325	John Roach, 1 theodolito.
284	326	John Roach, 1 level.
284	327	John Roach, material in process of advancement.
239	333	Fairbanks & Hutchinson, 12 different kinds of scales
313	354	V. S. W. Parkhurst, 2 of Howe's standard and 9 counter scales.
339	414	Drs. Folleau & Mabon, show case containing collection of trusses, and orthopedic instruments and surgical appliances.
339	415	Drs. Folleau & Mabon, show case of artificial legs, all invented and manufactured by exhibitors.
419	486	Mrs. M. A. Snydam, 3 patent cornea restorers.
437	505	Dr. E Bolle, patent apparatus for extracting teeth.
478	537	National Watch Co., Warren, Spadone & Hayes, agents for Pacific Coast, 5 Elgin movements, 4 cards containing different parts of the Elgin watches; 3 heavy 18-caret Elgin watchos; 3 silver Elgin watches
566	685	J. S. Phillips, port ible assaying machine.
3	7c7	California Business University, 3 sets of telegraph instruments.

CLASS VII.

Manufactures in Metals.

Entry No. of Article.	No. of Article.	
18	27	Morgan Gale, fancy shoeing hammer.
18	28	Morgan Gale, large A tuning fork.
25	36	John Nestor, Portland, combined carpenter's tool for weather-boarding.
59	71	Misgill & Coopor, samples of California manufactured horse shoes.
91	111	Ephraim Vorhes, combination lock, California manufacturo.
98	120	J. Perham, 2 stove pipe extension shelfs.
110	140	F. T. Houghton, 2 petroloum stoves.
110	141	F. T. Houghton, 2 automatic clothes washers and boilers.
110	142	F. T. Houghton, 3 patent chopping knives.
119	151	John McLeod, combined latch and lock.
148	179	Charles Otto & Co., case of twist drills, steel squares, tools, etc.
148	180	Charles Otto & Co., case of brass and plated goods, California manufacture.
151	183	Phelps Bros., boxes of bolts and nuts, turnbuckle and seg-screws, Cal. manufacture.
177	208	Henry Axtell, 2 pair of wire cutters.
182	214	Jacob Whitney, 2 tire lighters.
194	224	Ellis Ayers, 2 stoves and fixtures.
200	226	A. L. Stimson, Chicago, 4 Westlake patent lanterns—No. 1, tin, called the "Sun;" No. 2, heavy tin, called the "Railway King;" No. 3, brass, called the "Conductor's Pet;" No. 4, silver-plated, called the "Railway Queen:"
225	253	American Saw Co., samples of movable teeth, perforated and solid saws.
239	269	Wm. Jones, Clipper Mills, Butte county, steam pressure culinary vessels.
241	271	C. H. Foster, specimen of Foster's substitute for brass hinges.
285	329	J. B. Owens, cool oil stoves and lamps.
287	331	Standard Soap Co., submerged coffee pot.
289	335	Matthew Cooke, 2 "Little Giant" cast steel blasting wedges.
306	353	Gallagher, Weed & Co., whistles, gongs, hose pipes, couplings, nozzles, steam, water and gas cocks, brass hinges, rowlocks, etc., California manufacture.
333	385	Risdon Iron Works, 4 car wheels.
337	389	P. Riley, 2 pair of patent gas-pipe tongs.
345	393	M. Price, 2 cases of cutlery.
346	399	Joshua Gray, samples of broom, solder, piano covering and hook and eye wire.
353	409	F. B. Lamh, stove handle and household tool combined.

356 410 E. N. Robinson, tin ore, pig tin, sheet tin and tinware, from the San Jacinto Tin Mines of California.
373 432 Pacific Rolling Mill Co., hammered and rolled shafting, round, square and flat merchant iron, band iron, street railroad iron, horse shoe shapes, railroad axles and spikes, nuts, washers, machine and log bolts.
377 435 Schmester Bros., 2 Union ranges and parts.
378 436 J. Kindleberger and W. A. Arnold, reversible loose joint butts.
379 439 Carl Hinz, case of moulding tools.
380 440 Brittan, Holbrook & Co., stoves and fixtures, copper, tin, brads and tinned ware, and lot of Japanese ware.
383 443 Garvey & Kimball, steamboat and house bells, pulls, knobs, etc.
393 460 John Bobn, 3 stoves and fixtures.
399 466 Lawton & Co., milk cans.
400 467 San Francisco Lead, Pipe and Shot Works, pig lead, lead and tin pipe, drop shot and lead ore.
421 488 L. D. Herrick, Hendrickson's patent chimney top, and Herrick's sprinkler.
436 604 Root & Nye, chandeliers in blue and gold—gold gilt, French and English bronze, Egyptian, Gothic and Flemish sty es; chandeliers with center lights, to drop one or more lights; Gothic standards, in bronze and gilt figures, for drop lights; marble ornaments; bronze figures; gilt, bronze and marble clocks.
450 518 Cassin & Proctor, patent funnel.
455 528 David Stoddard, 6 English ratchet braces.
456 530 David Stoddard, 5 turning tools.
459 533 Jonathan Kittredge, Monitor safe, with California-made lock.
459 634 Jonatbau Kittredge, 4 fire and burglar-proof safes.
459 535 Jonathan Kittredge, 7 fire-proof safes, all California manufacture.
456 653 Will & Finck, 2 botel anunnciators.
472 574 W. T. Garratt, steam whistles, gongs, hose pipes, nozzics, couplings, torches, water and steam gauges; water, steam and gas cocks; globe valves, safety valves, boxes for shafting, composition nails for sheathing, sounding leads, pumps, Garratt's anti-friction metal, etc.
472 675 W. T. Garratt, 2 California-made bells, 480 and 850 pounds weight, with frames and wheels complete.
473 677 H. T. Graves, wire summer bonse, wire window screens, wire chairs, fenders, trellis work, sieves, riddles, coal screens, grape stemmers, meat safes, show stands, wire netting, wire cloth bird cages, patent weather strips, Cramer's patent window-lifting rods and plates.
474 679 J. H. Culver, improved calipers, California patent and manufacture.
529 635 K. Vail, 4 iron planes, Palmer's patent.
543 568 A. C. Taylor, slop boppers with patent traps, patent iron sinks, patent coffee pots and dish pans, all California inventions.
647 672 Pacific Saw Manufacturing Co., saws, mandrels, pruning knives, reaper and mowing machine sections, carrier knives, etc.
548 673 N. W. Spaulding, circular saws, with Spaulding's patent teeth.
563 663 August David, 2 ice cream freezers.
607 732 Currier & Winter, Howard & Tborndyke's improved mitering machine.
610 736 George Ruben, samples of patent sauce-pan covers.
657 830 J. C. Hammond, Sacramento, samples of I X L metal for friction bearings and journal boxes.
665 838 R. F. Osborn & Co., case of cabinet hardware.
665 839 R. F. Osborn & Co., case of carriage hardware.
665 840 R. F. Osborn & Co., case of tools.

CLASS VIII.

Wood and Its Manufactures.

Entry No. / No. of Article.

42 54 S. P. Taylor & Co., samples of California-made brooms and brushes.
68 83 F. Korbel & Bro., samples of cedar for counter tops, cigar box materials, and back boards for picture frames.
68 84 F. Korbel & Bro., laurel, rosewood, mahogany, Spanish cedar, maple and redwood veneers.
72 88 Elam & Howes, samples of wood and willow ware, their own manufacture.
106 135 S. E. & J. J. Hollister, washing machine and wringer.
106 136 S. E. & J. J. Hollister, model of washing machine.
127 160 Mrs. A. D. Waldron, washing machine.
156 187 D. G. Lewis, 2 washing machines with mangle attachments, and 2 wringers.
182 213 Jacob Whitney, Isabella washing machine.
272 311 Figer Bros., California-manufactured brushes.
279 312 Ezra Coleman, lot of boot-jacks.
330 382 E. A. Stockton, washing machine.
453 407 F. B. Lamb, 2 Pioncer washers.
384 444 Thos. J. Hall, lot of willow ware.
418 485 I. E. Thayer, stick of laurel timber 48 feet long, 28x28.
429 496 E. C. Bickford, Low's premium rotary washing machine.
473 559 A. Hatton & Co., 3 patent knife-cleaning machines (clean 600 per hour).
476 686 Dewey & Co., E. F. Dowey's patent cutter and can-opener.
525 647 M. C. Hawley & Co., Union washing machine.
531 553 Miss M. P. Carpenter, improved fluting machine, California invention.
537 662 J. W. Wissinger, patent swing.
550 675 Frank Buckclew, California washing machine.
670 690 W. A. White, samples of non-conducting iron-holders, California invention.
531 761 California Wine Cooperage Co. (M. Fulds, Son & Co.), mammoth cask, 4,155 gallons.

CLASS IX.

Glass, Pottery, Earthenware, Etc.

Entry No. / No. of Article.

123 165 J. F. Fugazzi, glass neck ties, etc.
180 211 John Mallon, specimens of ornamental glass cutting.
288 332 Son & Briggs, case of meerschaum pipes.
319 371 M. Clark & Son, Sacramento, lot of stoneware.
339 391 Pacific Glass Co., lot of assorted glassware.
381 441 Albion Pottery, lot of pottery ware.
464 650 Thomas O'Neil, samples of ground and cut glass.
471 673 A. S. Halbdie, samples of Morgan's plumbago crucibles.
679 700 Wm. Ries, Salt Lake, 2 samples of porcelain manufacture from Salt Lake.
623 755 Haynes & Lawton, show case of fine China ware.
5 788 S. & G. Gump, 4 pier mirrors.
5 789 S. & G. Gump, 2 mantle mirrors.
6 790 Whittier & Fuller, large mirror and frame, made by Jones & Wooll.

CLASS X.

Minerals, Geological Formations, Chemical Substances, Chemistry, Oils, Soaps, Candles, Dyeing, Distilling, Etc.

Entry No. / No. of Article.

23 33 George Pfeiffer, large cabinet of mineral and geological specimens.
31 43 George P. Rose, large cabinet of mineral specimens.
36 46 Hucks & Lambert, samples of axle grease.
47 57 J. J. Knowlton, boxes and bottles of California writing ink.
51 61 C. J. Clark, case of volcanic specimens from Hawaii.
67 67 S. Pillsbury & Co., samples of Madame Balcear's washing fluid.
67 68 S. Pillsbury & Co., samples of Parepa Rosa's toilet companion.
67 69 S. Pillsbury & Co., samples of liquid laundry blue.
61 75 J. G. Steele & Co., case of Stuart's "[Sun Pearl" for the complexion.
65 79 Hugo Mahnz, case of amiline dyes.
70 86 Pacific Match Factory, samples of California made matches.
88 107 A. Golish, samples of California made matches.
109 139 Samuel Purdy, samples of a composition on wire cloth and wood.
120 152 Dr. Barker, samples of a chemical compound for strengthening cordage, etc.
123. 154 J. F. Fugazzi, Sacramento, case of hair dyes, tonics, restoratives, pomades, etc.
133 165 Michael Lebetard, samples of Russian inflammable balls.
134 166 Dana & Coddington, California made glue in barrels and sheets.
134 168 Dana & Coddington, samples of neats foot oil.
137 171 Charles Zwick, Caucasian fly glue.
154 185 L. R. Mills, Pacific Congress and seltzer water.
209 237 M. Howard, hair restorative.
211 239 Boyd & Co., yeast powder, baking powder, cream of tartar and saleratus.
221 249 J. Walker, vinegar bitters, sapoine for the teeth, and cooking extracts.
251 283 Edward Louis, samples of aromatic water.
256 268 Lampe & Bro., samples of Spanisb lustral for the hair.
258 290 G. Heuter, samples of varnishes, sealing wax, cements, etc., California manufacture.
276 316 G. S. Brown, You Bet, Nevada county, specimens of gold-bearing cement and gravel.
287 330 Standard Soap Co., assorted soaps, and samples of chemicals incidental to the manufacture of candles.
312 359 Henry Lake, 6 boxes of patent blacking.
326 377 Geo. Waite, 6 boxes of California magic polish.
338 390 Crane & Brigham, case of sulpbate of copper.
348 402 B. F. Barton & Co., samples of soda, saleratus, salt, cream of tartar and yeast powder.
349 403 Parrish Soap Works, samples of Kane's condensed soap, finids, etc.
364 419 James Scringeonr, Chilcott soap.
385 445 Prof. A. P. W. Partz, a large specimen of portzite, a lately-discovered mineral, from Blind Springs District, California.
410 477 J. G. Hatch & Co., samples of Spanish dressing and blacking for ladies' and children's shoes, and dressing blacking for shoe dealers and manufacturers.
427 494 Gabel & Co., samples of axle grease.
441 509 Pacific Oil and Lead Works, samples of raw and boiled linseed oil, castor oil, linseed oil cake and linseed oil cake meal, flax seed, castor beans and metallic paint.
449 617 Sonntag & Co. (agents for Dr. Wilmar Schwabe homeopathic establishment, Leipzig, Saxony), 2 show cases of homeopathic medicines, chests and medical works.
457 631 J. E. W. Coleman, specimens of oxygenated paint.
476 685 Dewey & Co., mineral and cabinet specimens, curiosities, etc.
482 591 Dr. L. G. Yates, Centerville, Alameda county, case of geological specimens.
485 696 Dr. J. H. Wood, Napa, case of Napa soda.
513 628 M. H. Garland, cough drops in cases and bottles.
529 657 Mining and Scientific Press, systematic collection of minerals, rocks, fossils, and metallurgical specimens.
539 664 Challenge Soap Co., case of samples of challenge soap.
565 685 D. E. Vincent, magic cough cure.
567 689 J. H. Warwick, samples supolis.
581 702 Stringer & Co., samples of axle grease.
601 725 Mrs. R. L. Jones, Sacramento, patent stamping powder for embroidery, black and white.
606 731 Justin Gates & Bros., glass case of perfumery and chemicals.
553 743 Dr. G. H. Clapp, chemical washing soap.
619 757 Cordillera Mining Co., silver ore.
674 845 Robert C. Beatie, specimens of the black oxide of manganese, from the Tide Water manganese mine, near San Jose.

CLASS XI.

Jewelry, Silver and Plated Ware.

Entry No. / No of Article.

90 110 Mrs. D. S. Hutchinson, case of specimens of mechanical deutistry.
147. 178 George M. Wood & Co., case of stencils, stock, door plates, seals, etc.
179 210 T. C. Jessup, case of operative dentistry.
207 235 John J. Joiner, metallic signs, and specimens of engraving on metal.
235 264 Mrs. C. Cook, 2 cases of hair jewelry.
246 277 Odermatt & Ettbn, patent fountain pens and drawing instruments.
255 287 George T. Casebolt, 2 cases of silver-plated ware for coaches, lamps, etc.
422 489 G. L. Adams, specimens of operative dentistry.
509 525 San Francisco Plating Works, case of plated ware, and case of old ware re-plated.
617 749 N. Bassett, 2 bars of silver from 12 pounds of rock from Treasure Key mine, White Pine district.
624 756 Pacific Plate Works, by Haynes & Lawton, case of gold and silver-plated wares.
31 799 Jones & Wooll, one mirror plate.
111 143 Geo. W. Patch, samples of stencil work.
62 76 F. M. Truworthy, stencil plates and impressions.

Note.—Any error or omission occurring in this list will be remedied on application to the Entry Clerk in the Pavilion.

A Baby Show.—California wants a new sensation. Its people are so fast, enterprising and reckless, that they have "played out" everything except the babies, and of these—whew!—they have the most, best, handsomest and biggest in creation. Why not have a show of them? We have have had shows of big cows, bulls, calves, sheep, hogs and asses, and why not of big babies? What are all the breeds of cattle in comparison to breeds of men and women? If it is of such importance to the State to raise good stock as to offer premiums for the best, why don't we give premiums for the best babies? Only fancy the interest and excitement that would attach to an exhibition of five thousand handsome, fat babies and their interesting mammas! There is not a bachelor or Benedict in the State but would go to see them; and the ladies would be sure to go because all the gentlemen would be there. Oh that we had some of Barnum's genius amongst us! California's grandest, best and most beautiful products would not be long unexhibited.

Weekly Shareholders' Directory, for Meetings, Assessments and Dividends.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

San Francisco Prices of Copper Ores.

San Francisco, Oct. 1, 1869.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

	Per ton.		Per ton
12 per cent. ore	$24 00	18 per cent. ore	$41 40
13 " "	26 65	19 " "	44 65
14 " "	29 40	20 " "	48 00
15 " "	32 25	25 " "	62 80
16 " "	35 20	30 " "	75 60
17 " "	38 25		

Ores assaying above 30 per cent., $2.50 per unit. Bars at the rate of 13c. per lb. for pure copper.

These prices, corrected by W. T. Atwood, we believe will be found substantially correct, and can be realized at this date.

Masonic Mirror.—A very neatly printed monthly under this title, made its appearance last week, being "devoted to the interests of Masonry on the Pacific Coast." The editor is Amasa W. Bishop, P. M., and the publisher, F. R. Carrick, No. 608 Market street. Subscription price, $2.50 per annum. Table of contents: Salutation, East and West, Rebolds; History of Free Masonry; Life—What is it; Let there be Light; The Eye of Masonry; Explorations at Jerusalem; Historical Notes; Vouching of Visitors; Admission of Candidates; Antiquities of Free Masonry, Walter Scott; St. John's Day; Mysterious Organist: pp. 32.

Central America Mahogany has been introduced here by Hobbs, Gilmore & Co., being found cheaper than the Eastern. ***

Opera Glasses, telescopes, magic lanterns, drawing instruments, microscopes, etc., at C Muller's, 205 Montgomery street, Lass Block.

Steam is on after 2 P.M. daily. Music at 2 and 8 P.M.

The Human Voice.—A strong human voice, when pitched at a high key, has been known to produce vibrations sufficiently strong to break glass. This was once done in a London coffee-house, by the well known tenor singer, Mr. Broadhurst. He caused the bowl of a wine glass, sitting upon a table, to separate from the stem by sounding a high note. The effect of the voice upon flowers has been made widely known by the recent lectures of Professor Tyndall.

A Mountain Range of Iron Ore in Alaska.—Professor Davidson, of the United States Coast Survey, reports discovering during his recent eclipse expedition in Alaska, a mountain range of iron ore, extending from the month of Chilkahl river far beyond his astronomical station. The range has an elevation of two thousand feet, and causes a local deviation of compass of two degrees.

The national Pomological Convention, which has just been holding a three days' session in Philadelphia, concluded by a grand dinner, adjourned to meet in Richmond, in 1871. A fruit-preserving house, invented by Reese, was favorably reported upon.

Mining and Scientific Press.

PUBLISHED EVERY SATURDAY,

At No. 414 Clay Street, San Francisco.

If you are an Inventor, Patentee, Miner, Farmer, Manufacturer, Mechanic, or a progressive Student or Artisan in any Industrial or Professional Calling in the Pacific States or Territories, you are doing yourself irreparable injustice, if not already a subscriber and reader of the Mining and Scientific Press.

It contains hints and information enough to repay the subscription price many times in a single month.

Its columns are filled with instructive reading in plain, comprehensible and attractive form to minds of ordinary intelligence.

It contains 16 pages and 64 columns of the size of Harpers's Weekly, and is the best printed and most valuable paper on the western half of the continent. All claims of patents issued to inventors on this coast are reported. Illustrations of new machinery are given each week. Descriptions of new inventions and discoveries throughout the world, are given, with fresh and comprehensive information of scientific developments and mechanical and industrial progress, which cannot be obtained from books, or readily found gathered in so convenient a form elsewhere. Subscribe now, and you will not regret it. Price $5 per annum.

DEWEY & CO.,
U. S. and Foreign Patent Agents.

The large majority of United States and Foreign Patents granted to inventors on the Pacific coast during the past few years, have been obtained through the agency of Dewey & Co., publishers of the Mining and Scientific Press. Established in 1860, we have an extensive patent library, with full record of cases on this coast, and can give the best and most reliable advice as to the patentability of new inventions.

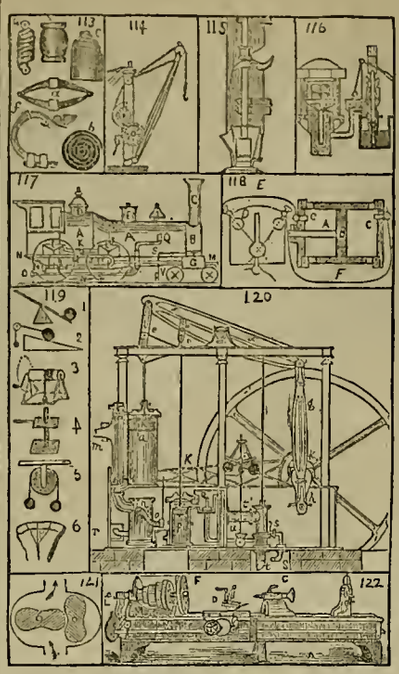
Callahan's Ranch, Sept. 24, 1869.

Messrs. Dewey & Co.—Goats :—Letters patent received yesterday, and you will please accept thanks for your prompt efforts in securing them.

Yours, etc., F. H. Brinkkotter.

The "first spike" was driven on Tuesday in the Virginia and Truckee Railroad, and already there is a locomotive running on the track.

Pamphlet Patent Circulars free at our office in the Pavilion.



Established - - - - - 1860.

DEWEY & CO.
PATENT AGENTS,
Engravers and Publishers
Mining & Scientific Press.
Circulars Free.
SAN FRANCISCO.

Office, No. 414 Clay Street.

The accompanying plate is from a series of Mechanical Movements illustrated and described and illustrated in our free circular, just issued, which contains a large amount of valuable information relating to Caveats, Patents, Patent Laws and Decisions, and the Rights and Privileges of Inventors, Patentees and Assignees. Copies sent to any address on receipt of postage stamp.

Promptly and Accurately

We draw up legal assignments for patentees; record assigaments in the Patent Office; procure copies of United States and Foreign Patents; make examinations here and at Washington regarding the patentability of inventions, take up and prosecute rejected cases, depending upon success for our fees; reissues taken out; interferences prosecuted—in fact, every legitimate branch of the patent agency business is thoroughly conducted by us here and our branch agency in Washington.

DEWEY & CO.,
No. 414 Clay street, San Francisco.

Circulars Free.

Volunteer Compliments.

From an endless series of appreciative testimonials and frank acknowledgements, we give the following:

"Tidal Wave" Office, Silver City, Idaho Territory, July 27th, 1869.

Messrs. Dewey & Co.—Gentlemen:—Allow me to express my high appreciation of the ability and business management of the Mining and Scientific Press Patent Agency, and to say that our business relations have been marked with the utmost promptitude upon your part and with entire satisfactiou upon mine.

Yours, etc., Jno. S. Butler.

Marysville, Cal., August 13th, 1869.

Messrs. Dewey & Co.—Gents:—Enclosed find $20 (currency) for last fees on patent for gang plow. I am very much surprised, after opinions received from Munn & Co. I am, respectfully, yours, F. A. H.

The original of the above letter (and many others with similar reference to other agencies) can be seen at this office, in cases for which we have secured patents for inventors who had been denied patents, or who had paid for being told that they could not obtain patents. Inventors on the Pacific coast are fast learning to patronize first-class home agents, who better understand their cases and will give more thorough attention to every invention entrusted to their keeping.

DEWEY & CO.,
U. S. and Foreign Patent Agents.

Somersville, Cal., August 25th, 1869.

Messrs. Dewey & Co.—Dear Sirs: Allow me to return you my thanks for the very able manner in which you have conducted the business entrusted to your care. You will please forward the documcut (British Patent) by Bamber's Express to this place. Yours, respectfully,

Geo. Hawkhurst.

Jamestown, Cal., July 6th, 1869.

Messrs. Dewey & Co.—Gentlemen:—The Patent for our Ore Washer and Concentrator was duly received by express. We return you our thanks for the promptness and successful manner which have attended your efforts in our behalf. Yours, Wm. G. Heslep.

The Right Stamp!—One of our wide-awake California inventors (who has already received two patents through this office) evinces the true winning spirit in the following note:

San Jose, Cal., June 29, 1869.

Messrs. Dewey & Co:—A few days ago I received your letter apprising me of the rejection of my case, etc. Well, under the circumstances, I will just say, "*Let 'er rip!*" and I will remember the indefatigable Zack. Taylor's advice to his soldiers—"Pick your flint and try it again." I will have to try and get even on somethiug else. I am satisfied you have done your duty as agents. Yours, J. F. C.

Suisun City, Cal., June 26, 1869.

Messrs. Dewey & Co:—This is the third time you have presented me with Letters Patent within twelve months. Gentlemen, you have done all I have asked of you—you have been honest; you are men that an inventor can rely upon for doing business for him, and he need not fear of being swindled or wronged in any way. I would give you business to do in your various departments in preference to any one else. Many thanks to you for your success. You have obtained valuable patents for me, and I appreciate your kindness, your honesty, ability and success. Yours, Richard Knott.

Mayfield, Cal., June 26, 1869.

Dewey & Co., *Patent Solicitors, San Francisco*—Gentlemen:—In acknowledging the receipt of my Letters Patent, allow me to express my thanks for the skilful and trustworthy manner in which you have conducted my business before the Department at Washington. I am perfectly satisfied with the high degree of ability and integrity displayed in the management of my case, and I know of no similar agency in which I could place corresponding trust. Yours truly, J. M. Johnson.

Nevada City, Nov. 3d, 1868.

Messrs. Dewey & Co.—Gentlemen:—Your favor of the 30th ult., is just received, informing me of the successful prosecution of my application for a patent on my "Hair Cutting Shears." Please accept my sincere thanks for the speedy and successful manner in which you have conducted the case, and believe me, as ever,

Very truly yours, Lee D. Craig.

San Francisco, May 5, 1869.—Messrs. Dewey & Co. Gentlemen:—Allow me to express to you many thanks for services rendered me in procuring my patent, which has just come to hand. I would also say that your work has been faithfully done, and your advice and representations have in all cases been honest and truthful.

Respectfully, Geo. Inwood.

San Francisco, April 19, 1859.

Messrs. Dewey & Co., Patent Agents.—*Gentlemen:*—Allow me herewith to tender you my sincere thanks for the efficient assistance you have rendered me in securing my patent, and other papers, as well as the promptness and energy displayed by you in our business transactions. Very respectfully yours, C. E. Jaycox.

Portland, Oregon, May 2, 1869.

Messrs. Dewey & Co—*Gentlemen:*—Receive my kindest thanks for your attention in the matter of bringing my application for a Patent to a successful issue.

Thomas Mann

Grass Valley, Dec. 2, 1868—*Messrs Dewey & Co:*—Having received the patent for Symons & Co's Tossing and Refining Concentrator, through your Agency, we return our sincere thanks to you for your unrivalled success. Yours, respectfully, Symons & Harry.

Lexington, April 3, 1869.

Dear Sirs:—The Letters Patent have just come to hand For the prompt and business-like manner with which you have put the matter through, please accept my thanks. Geo. W. Teasdale.

To Dewey & Co., Publishers M. & S. Press.

Stockton, April 8th, 1869.

Messrs. Dewey & Co.:—Your favor of the 6th inst., accompanying patent for improvement in horse shoes, is received. I beg you will accept the earnest assurance of my gratitude for your kind assistance and valuable services. Very truly yours, W. R. Watson.

Returned.—Dr J. H. Paine, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

10v18 6m B. F. Howland.

Co-Operative Union Store.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 21v18-4w

Dr. Hall has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germany, and has held consultations with the following eminent physicians: Drs. Curling Druit, Lee, Parker, Acton, Aitken Churchill, Ricord, Velpeau, Beech, Sperino, and Dewliz Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry to say, those of Americans. Americans will not now be under the necessity of leaving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco 21v18-3in

Use Pain Killer for Cholera and Bowel Complaints, for Boils, Cuts, Bruises and Scalds, Old Sores, Sprains, Swelling of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Frosted Feet, Felons, **Sore Throat,**

Sudden Colds,

Coughs, Etc.

Use it for any of these, and you will never do without it. Its success as a valuable family medicine has induced others to initiate and counterfeit the Pain Killer to some extent. *Beware of Counterfeits!*

A Family Medicine.—The PAIN KILLER is a purely vegetable compound and while it is a most efficient remedy or pain, it is a perfectly safe medicine, even in the most unskilful hands. For Summer Complaints, or any other form of bowel disease in children or adults, it is an almost certain cure, and has, without doubt, been more successful in curing the various kinds of Cholera than any other known remedy, or the most skilful physician. In India, Africa and China, where this dreadful disease is more or less prevalent, the Pain Killer is considered by the natives, as well as European residents in those climates, a *sure cure.*

We have long known the high character of the Pain Killer, and that it is used with great success and satisfaction in our best families. It is the favorite medicine of our missionaries in heathen lands, where they use it more than all else together for the diseases that abound in those warm climates. It should be kept in every house, in readiness for sudden attacks of sickness.—*Chr. Press.*

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

PERRY DAVIS & CO., and HOSTETTER & SMITH, San Francisco, Cal., General Wholesale Agents

New Advertisements.

J. ROSS BROWNE,

No. 91 Montgomery Block, San Francisco,

Will examine and Report upon AGRICULTURAL LANDS, RANCHES and MINING PROPERTIES, situated in any of the States or Territories west of the Rocky Mountains.

Mr. Browne intends o devote the autumn and winter months to a personal examination of such properties as may be offered, and proposes to go East with them early in the spring.

His principal aim will be to encourage IMMIGRATION TO THE PACIFIC SLOPE, and to promote the investment of EASTERN CAPITAL in all legitimate enterprises that may be committed to his charge.

Surveys, Maps and Diagrams of Ranches, Mines and other Properties,

Will be made, if required, by HOFFMAN BROTHERS, Civil Engineers, No. 85 Montgomery Block.

Apply in person or by let er to J. ROSS BROWNE,

13vt9 2m No 91, third floor, Montgomery Block.

☞ Agents for Blake's Patent Steam Pump, (warranted the best in the market); Davis & Furber's Woolen Machinery, etc. Being the selling agents for most first class Eastern builders, millmen and others in want of Machinery can save money by giving us a call. Illustrated Catalogues sent free.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Leviathan.—*Miner*, Sept. 18th: Prof. Rickard will at once erect a smelting furnace at this mine. At least the thing so long talked of in Alpine will be tried. It is said that 1,000 tons of Leviathan ore will be immediately shipped to England.

The *Chronicle* says: The Leviathan smelting works are to be capable of reducing six tons of ore per diem, and it is the intention of Mr. Rickard to have them in operation in six weeks. From appearances we judge that thie, the last claim started in our county, will be the first to remunerate its owners.

Tarshish.—*Miner*, 18th: Mr. Schwerin, Resident Director, returned on Wednesday and has a gang of men taking the water out of the shaft preparatory to resumption of work.

Good looking sulphurets in the Globe Tunnel....Tunnel No. 3 of M. C. M. Co. is driving in at a satisfactory rate.

AMADOR COUNTY.

Casco.—*Ledger*, 25th: We learn that a flattering prospect has been struck in the Casco mine.

More Quartz.—The Marklee claim and Cuneo & Co's near Foster's ranch, five milee from Volcano, are giving good prospects. A crushing of several tons of ore from the Marklee yielded $50 per ton. Another claim on Sutter Creek, four miles above Volcano, is giving an excellent show of gold and sulphurets.

CALAVERAS COUNTY.

Palomo.—*Chronicle*, 25th: The company are sinking with better prospects than ever; the mill and hoisting apparatus working to satisfaction. Alexander & Co. are erecting new hoisting works and expect to have them running in a few days. The mill is running day and night. We have seen some rock bronght in by Andrew McFadden, as rich as ever was found in the county.

Mining Items.—The claims on the Central Hill channel pay largely. That of Jackson & Co. worked through an incline, is paying from $8 to $10 per day to the hand. The next claim on the same lead is Harkins & Co's. The gravel bas averaged $9 to the car load, or $30 per day to the man. Adjoining on the north, is the Pellaton & Co. claim. The owners expect to be taking out gravel in a short time. Next to this are Porter & Co., who are making fair wages. The Paul claim are in good dirt. At present they are making preparations to commence breasting out. The Golden Gate claim is doing better than ever. Shaw's hydraulic is in active operation. Brackett & Co. have partially suspended.

INYO COUNTY.

Lone Pine.—A correspondent writes from this place, Sept. 13th: A new quartz mill has been erected withiu a mile from here, and will operate on Cerro Gordo ore during the present month.

MARIPOSA COUNTY.

Coulterville.—*Gazette*, 24th: Douglass & Co. have commenced operations on the Mary Harrison quartz vein. They are sinkiug a shaft. Ralph Jones is working his vein on the Melvina, with every prospect of success. He has a large quantity of rock out and only awaits rain to commence crushing.

NEVADA COUNTY.

Mining Items.—Grass Valley *Union*, 21st: A lump of retorted gold worth over $1,500, came into Findley & Co's bank yesterday, from the John Bright mine; and the Mutual, of Graniteville, seuds down $1,800 worth of gold, crushed out within a month with a 5-stamp mill. The leading mines are being worked with their usual results. There have becu lately made some loeations of deep diggings in the hill north of Squirrel Creek. The company havo found prospects, indicating an ancient river channel. Preparations are being made to work these diggings tbis winter. The Brown Bros., on Squirrel Creek, are preparing to do extensive washing as soon as water comes. They have ground enough to last them several years.

Wisconsin Mine.—Same of 23d: The new mill will be ready for crushing in two weeks. The ledgo shows improvemeut in size and appearauce.

Allison Ranch.—Same of 24th: The work of resetting the engine and putting in the big pump has been completed, and the mine is nearly drained. Work has been commenced in the old drifts, and excellent

Suspended.—*National*, 26th: One of the large flumes on the line of tbe ditch, near Eureka, is being repaired. In consequence, mining operations are for a time suspended at Relief Hill and some other places.

Quartz Discovery.—*Gazette*, 22d: Johnson and others have discovered a promising quartz vein this side of Willow Valley. They have taken out six or eight tons of rock and will test it by mill process.

Kansas Claim.—Same of 27th: The machinery has been removed and put up at the point selected for a permanent shaft, and the workmen will commence sinking to-day. The shaft will be three by eight feet, containing three compartments, two of which will be used for hoisting and one for pumping. The purpose is to employ three shifts, and perhaps two months will be required to reach the bedrock.

Mining Matters.—*Transcript*, 26th: In gravel, the prospect obtained by Allen, on Selby Hill, is encouraging, and it is rumored that work is to be resumed on the Harmony ground. The San José Co. adjoining Marselus and Maltmau's, have struck good gravel. As soon as water can be obtained, work will be resumed upon the Birchfield claims. At the Cascades, on Deer Creek, extensive preparations are being made for hydraulic work. The large companies working at Blue Tent will do a great deal of work. On the ridge south of the Banner, partiee are engaged in preparations for opening gravel claims.

In quartz mining the prospects are good. On Rush Creek and Wood's Ravine parties are prospecting. The Mount Auburn Co. has taken out 30 or 40 tons of excellent rock, and the ledge is from two to three feet tbick. The old Vigilance will soon have a mill erected. The Banner Co. is obtaining some first rate rock, and exceedingly rich rock has been struck in the Pittsburg. The prospect in the county is better than for many years, at this season.

PLUMAS COUNTY.

Black Hawk.—Occasional correspondence of the Quiucy *National*, Sept. 18th: "The lodes being opened by Dr. Coleman give promise of being the most important development in the State. There are fifteen ledges, located separately, under different names, and collectively as the 'California,' all located under the act of Congress, July 26, 1866, and claimed as one lode, as all are within the same casings 800 feet apart. The lode has been traced almost the entire distanco (3,000 feet). The richest quartz was taken from the 'Eilen Tremaine,' $83 50 from ten pouuds of rock. The 'Coleman' has produced rock that paid upwards of ten dollars a pound by band mortar. A tunnel is now being run along the 'Coleman' and one hundred tons of quartz have been taken out during the last five weeks, which at the *lowest estimate* will pay $25 per ton. The exteusion both north and south are taken up by experienced quartz men. Ahove the ledges no gold has ever been found, whilc in them and below almost fabulous sums have been taken out. During the past year the Black Hawk Co., working four men, (only abont seven months), have taken out upwards of $20,000 of *exactly similar* gold to that now taken from the ledge. There is an abundance of watcr, and a mill can be placed at the watef level on the ledge, with a full face of quartz five huudred feet high. There is an inexhaustihle amount of timber on the ledge; climate unequalled; good wagon road from Quincy. Nothing is wanted save a good mill. No furnaces, pans, or other extras will be needed, as no 'rebellious ores' are to be found."

The *National* adds: "Ou Thnrsday last we made a visit to the mine, and although we concede the above account somewhat highly drawn; yet we must say that Dr. Coleman has made the discovery of a very rich quartz vein. We should like very much to have the privilege of workiug some of the rock which we saw with a hand mortar, and take tue proceeds for our pay."

Carriboo.—Letter to same: Messrs. Lind, Jouos & Lineheart, at Stag Bar, have reached the bed-rock, and are getting fair prospects. Mr. Jo. Buffington, continues running his tunnel for the Wild-Cat channel. Lamb & Jobns continue to work their claim in the upper channel, and are making good wages. There is talk of bringing water on that channel. Should this he done, they will have one of the best claims in the county. Thompson & Mather in the Wild-Cat channel are doing well. They have a largo amount of grouud prospected that will average ½oz. per day to the man. Jo. Hickman, iu the lower cbaunel, is stripping a large piece of ground. Thos. Orton, adjoining Mr. Hickman, is making ½oz. per day to the man. Brewer, Dotta & Co. have been very unfortunate in

SAN BERNARDINO COUNTY.

The New Mines.—*Guardian*, 18th: Many of our citizens have taken the fever and gone to the placers. They are about 30 miles from this place, near the top of Lytle Creek, or Cocomungo Monntain. Whether extensive cannot as yet be told; only one gulch having been found, beside the first, that will pay good wages. The locality is destitute of vegetation other than a dense body of pine timber, and water is very scarce, but one company having enough to mine with. The gold is very coarse, varying from 12½ cents to *chispas* that weigh forty, fifty, and sixty dollars.

SIERRA COUNTY.

Wehee.—*Messenger*, 25th: We have been shown by Mr. Wehee some fine looking rock from his ledge, on the North Fork. It shows free gold and black sulphurets abuudantly.

SISKIYOU COUNTY.

Quartz Mill.—Yreka *Union*, 25th: The Scott Valley company will have their mill completed in ten days. They are taking from their ledge a large amount of quartz.

Black Bear.—Wo learn that this company on Salmon are running tbeir mill day and night and crushing better rock now than ever before.

Big Valley.—We learn that a great excitement prevails in relation to a reported discovery of rich miues in the mountains twenty miles south of the eettlement on Ash Creek. Nearly everybody had gone to the mines. It was reported that two quartz ledges had been discovered, one rich in gold and the other silver, and between the two a vein of coal.

TRINITY COUNTY.

Canyon Creek.—*Journal*, 25th: A gentleman from San Francisco has been prospecting on Cañon creck. Ten cents has been extracted from one pound of the rock.

Weaver Creek.—The Weaver Creek Fluming Company are pusbing the work on with energy. They have put in between thirty and forty boxes this season, and are progressing at the rate of one a day.

New Diggings.—Last week a Frenchman brought into town nine ounces of heavy and fine looking gold dust, obtained by him on Stewart's fork of Trinity river. Several have gone to prospect in that section, and there are indications that the diggings are extensive.

TUOLUMNE COUNTY.

Confidence.—Sonora *Democrat*, 25th: This company made another clean up last Sunday after crushing 190 tons of ore which produced 390 ounces of retorted gold worth in value more than $7,000. The ledge is from three to four feet in thickness.

Arizona.

Prospecting Parties.—Prescott *Miner*, 11th: During the week two partics of men left Prescott and started out into the wilderness to hunt for gold. One led by Cal. Jackson, 29 in all, goes to prospect the country east of tbe Verdc, and south of the Mogollone range of monntains. This party started on the morning of the 8th. The other went nortb, intending to prospect the Little Colorodo and its tributaries. The Captain is S. C. Miller. This party, 23 in all, are led by experienced men.

Mining.—We have nothing new regarding mines and mining, this week. The lodes now being developed are looking well. All the mills are idle, waiting for water.

The San Diego *Union* of the 22d, says: We have the following from our correspondent: "The San Francisco prospecting party of which I wrote you, returned to-day and brought 15 pounds of ore which was melted with blow pipes and found to be more than half silver. You never saw such an excitement in the place before. Everybody talks mines and some are almost crazy on the subject. There is no humbug about it, for I assure you it is the richest thing on record. A large party in company with the discoverers left town this morning for the mino in order to take up extensions."

Idaho.

Ida Ellmore.—Owyhee *Avalanche*, Sept. 10th: Looks better than ever. The lode has been gradually widening. The shaft is down 60 feet below the third level.

Golden Chariot.—The shaft is within ten feet of the point at which a new level is to be formed, which will be 350 feet from the surface.

Red Jacket.—They have commenced a level at the bottom of the shaft, which is now 80 feet deep in both dirccticns. There is quite a pile of ore on the dump, and some of it is exceedingly rich.

Poorman.—A lead two feet wide, was

fect from the shaft. Tbe ore looks well.

Empire.—The sbaft is 40 feet deep, and a large heap of fine looking rock is lying at the mouth of the sbaft, which will be crushed soon at the Webfoot mill.

Allison.—Work is still progressing. The Home Resort owners have a large double shaft sunk on tbeir mine to a depth of 30 feet, and have commenced drifting at that point. Tbe lead is well defined, 2½ feet wide, and in much of the ore free gold is visible.

Slate Creek.—Sinclair, Sands and Co. are working their placer claims. They are down several feet, but bave failed to reach bed-rock yet. Mr. Sinclair thinks tbese placers will pay from four to five dollars per day.

Loon Creek.—Boise City *Statesman*, 18th: Judge McBride returned yesterday. At Oro Grande when he went there the only currency was greenbacks, but when he left dust was coming into circulation. A good many are coming in from Lemhi and Montana, and most of them stay.

Nugget from Loon Creek.—Knapp, expressman, arrived at Idaho night before last. He exhibits a nugget worth thirty-eight dollars, from one of the cañon claims.

From Loon Creek.—Same of 23d: Mr. A. A. Revere just returned from Oro Grande. Whcu he left it was reported that good prospects bad beeu found fifteen miles south on Yankee river. Three dollars to the pan has been taken out. A report had also come from Long Creek forty miles east by north. Good half ounce diggings were reported from there, and at the time Mr. Revere left Oro Grande, from one hnndred to onc hundred and fifty men had started for that place. Provisions at Loon Creek were becoming scarce and high, thongh he met several trains going in. Several companies had joined together for the purpose of sending out after their winter supplies.

A Counterblast.—Hamilton *Empire*, 22d: Joe Lncket writes to Mr. Sweeney, of this city, from Idaho City, under date of the 10th instant, as follows: "I have just returned from the new diggings on Little Salmon river, perfectly satisfied. Nearly all of the boys from this place have got back. It is a little one-horse camp, gobbled up by meu from Lemhi. It ie nothing but a littlc creek with small bars, and hut few of them pay. Bill Stephens and a lot of the boys from Rocky Bar have also returned."

Montana.

Basin Gulch.—Helena *Gazette*, 16th: John Ryan informs us that ten days ago a nugget weighing 1½ pounds avoirdupois was taken out of Skimerborn & Co's claim. Water is ecarce, but the pay is $30 per day to the hand; one man washed out $500 in six weeks.

Blackfoot.—Chas. Simmons informs us that mining is pretty much at a stand-still, owing to tho scarcity of water.

Nelson Gulch.—Dahler & Truett have surveyed eighteen miles of the contemplated ditch. It will be twenty-five miles long, and will be supplied with water from Beaver creek, at the head of Ten Mile.

A Stampede.—*New Northwest*, 17th: Quite a stampede has heen going on from Deer Lodge to Dry Cottonwood. The gulch is eight miles above town; the discovery six or eight miles up the gulch. The ground prospects 20 and 50 cents to the pan; some 50 or 60 claims have been takeu up. The ground is from eight to ten feet deep.

Peterson Gulch.—There are 20 or 30 men openiug claims, although there is no water. The gulch is narrow; bed-rock four to six feet with boulders occasionally, and prospects from 2 to 25 cents to the pan although as high as $1 has been panned. Tbe water of the gulch is taken out above for Caraboo. A few days since the Stuart Brothers and others purchased the Lucas and the Lawson & Alport ditches; will bring the water to their ground at a height of 60 or 70 feet, enabling them to hydraulic the gulch and bars. These ditches have a capacity of 700 inches. We expect to see 200 men employed in Peterson gulch next summer.

New Gulch near Butte.—From Mr. Gilchrist we learn that a stampede occnrred on Tuesday to a gulch 2½ milee west of Butte City. John Philips took $1 to the pan from discovery, and washed $18 from three small wheelbarrows of dirt. The ground is only 15 inches deep, but increases in other parts of the gulch, which is three miles long, to five feet. Parties are working with rockers using spring water.

Nevada.

COPE DISTRICT.

Argenta.—Elko *Independent*, 25th: Col. Denver had nine tons of ore from the Ar-

tho value of the pulp was $450 a ton. After crushing, the pulp was shipped to Swansea for treatment, and 85 per cent. of the assayed value advanced to tho owners.

Mountain City.—*Empire* of 25th gives this extract from a private letter dated 15th: "Every one is rich here in prospective. The float rock is certainly very rich. Some of the ledges are valuable property. The hillsides and most of the gulches contain gold. I have seen from the color up to four or five cents to the pan washed out. Lots in this town range from $300 to $1,000. There is a 10-stamp mill now on the road for this place.

ESMERALDA.

Pine Grove.—*Aurora* letter, 16th: The Wheeler mine has been worked with favorable results. In the upper level the ledge is four to eight feet wide; the rock pays $80 per ton, and growing richer. They are working a 10-stamp mill, and the mine has paid $15,000 to $18,000 per month. The Wilson mine pays regularly from $18,000 to $20,000 per month. The Kean, containing 1,000 feet, is rich. John Wheeler is putting up a 10-stamp mill.

MINERAL HILL DISTRICT.

The Locality.—The Grass Valley *Union* gives part of a letter from G. Y. Dorsey, Sept. 22d, defining the position of Mineral City. He says: "This place is south of Cope and about 150 miles from it. Cope District is north of the railroad, and Mineral Hill District is about 50 miles south of the railrord." Mr. D. adds: "This is the richest district in the State of Nevada. The mineral is rich beyond any doubt, and there is plenty of it. Mineral City is in a pleasant valley, at the foot of Mineral Hill. There are between 300 and 400 men now in the camp. At this time houses are going up in every direction, and everything is lively. There is plenty of good water and any amount of wood at hand. One of our companies shipped to Austin 25 tons of rock, paid $40 per ton for hauling, and received $22,000 over and above all expenses in return. This is an example of what our ore can do."

The *Reveille* of 20th says: We saw persone who arrived from Mineral Hill on Saturday, all of whom agree in the opinion that it contains a valuable deposit of ore. The most important property is owned by the discovery company. The ore reduced is hauled to this city at present, but it is only the high grades that will bear the expense. We were informed that no discoveries of ore have been made outside of the small hill from which the district received its name.

Live Yankee.—The correspondent of the San Francisco *Herald* writes, 19th: "The whole top of the hill appears to be a body of rich silver ore, containing just base metal enough to spoil it for working it by wet process. At the Live Yankee they are sacking ore worth $2,000 per ton, and they estimated the second class to be worth $300. There has been $6,000 worth of float ore picked up on the side of the hill, hauled to Austin at an expense of $35 per ton for freight. The mills charge $35 more for working, and guarantee a return of 85 per cent."

REESE RIVER.

Annie Angie.—*Reveille*, 23d: One week ago Joseph May and John Moitt discovered in Marsball Cañon, two miles south of this city, a fissure vein, three feet wide. At the surface the pay streak or stratum, was one foot thick. They carried specimens to the Manhattan mill, a test of which disclosed silver at the rate of $238.93 to the ton. They have named the discovery Annie Angie.

Spring Valley.—Letter to same, Sept. 20th, from this district, says: "There are 25 or 30 men here taking out pay ore, the grade of which is generally high. The Reese and Berry owners are working in the croppings, from which they have made good shipments to Austin. The Mayot shows pockets of born silver equal to the best in White Pine. The Grant, Red, White and Blue, Five-Twenty, Specie Payment, Frisco, Providence and Murray, and many others, show good ore."

Rich.—Same date: A lot of 2,500 lbs. of ore, brought to this city from Spring Valley District for reduction at the Mettacom mill, netted the owner $964 in gold. The assay of the pulp of 600 lbs. of the small lot yielded at the rate of $1,700 per ton.

WASHOE.

Occidental.—*Enterprise*, 26th: The new tunnel is progressing favorably in picking rock,—is now in between 1,100 and 1,200 ft., and will have to be driven 75 ft. further before striking the lead.

Lady Bryan.—The company start their new mill to-day. They have out and on hand 700 tons of ore that will mill at least $40 per ton. The ore is from the 90-foot level and all the way up to the surface. They are taking out 50 tons per day.

Ophir.—The company have got their air pipe in position and their new blower works to perfection. To the bottom of the main shaft—700 ft.—the tubing is of wood, one foot square in the clear, thence to the end of the drift—650 ft.—of sheet iron tubes 10 inches in diameter.

Virginia Consolidated.—The shaft was down 305 ft. last evening. It is in very hard blasting rock. They are making as good progress as could be expected. Next Monday they will shut down for the purpose of putting in a new pinion wheel.

Gould & Curry.—The company are drifting north and south from the bottom of the Bonner shaft, 1,185 ft. deep. Two days since they made the connection between the 100-ft. level and the second station, 425 ft. below the surface. This gives the workmen an ample supply of good air. They are extracting 40 tons per day of ore, that assays $48 per ton, most of it from the 100-ft. level

Belcher.—The Belcher Co. are taking out from 20 to 25 tons per day of good ore. They yesterday morning began shipping ore to the Kolsey mill.

Walker's Defeat.—Work is to be resumed on this old mine above Devil's Gate. Some assays lately made of ores have gone as high as $400 per ton, principally gold. Of course poorer rock could be found in the mine by hunting for it.

Overman.—The prospects seem to be brightening. They are taking out from 25 to 30 tons of good ore, with good indications of new deposits.

Yellow Jacket.—The south shaft of the Yellow Jacket is yielding 175 to 180 tons of good milling ore per day, and the north shaft is being put in shape for work.

WHITE PINE.

Weekly Mining Review.—*News*, 25th: Everybody is getting out ore and sending it to the mills, and the latter are running to their full capacity. A large number of our mines show improved prospects as they are being developed, and all continue to yield as good ore as at any former time, and in increased quantities as room is made for more men. Much more work is being done also in prospecting and developing unproductive claims than one would expect, considering the extreme scarcity of money.

Bullion.—Following is the statement of the total shipments of White Pine bullion, for the figures of which we are indebted to W. C. Child, of W., F. & Co. The shipments run through from Sept. 15, 1868, to Sept. 15, 1869:

From Shermantown	$352,829.22
From Newark	106,238.54
From Treasure City	526,891.93
From Hamilton	1,511,198.25
From Austin (White Pine Bullion)	533,059.85
Total	$3,030,217.74
By other channels	125,000.60
	$3,155,217.74

The figures for the shipments by other channels are of course an estimate. It is probable that actual figures, correctly got, would exceed the estimate.

In remarking upon the above showing, the *News* says: "These statistics tell a story that has never been told of any other silver mines in America. We have not the data to ascertain the average number of stamps employed in the production of that amount, but we think it would not exceed fifty. Over $50,000 to the stamp per annum is without a parallel. * * * At the same rate of production with that of the past year, the yield next year should be $18,000,000. No account has been made of the product of our smelting furnaces, which are rapidly growing in favor and increasing in number."

Items.—*Empire*, 22d: Maggie Consolidated is daily improving in appearance. A large amount of smeltiog ore is being obtained.... An important strike was made in the Edgar shaft yesterday. Some good ore was developed at a depth of 70 feet, and the strike goes to establish the continuity of ore between the Earl and Hidden Treasure....23d: The California Company yesterday suspended the work of sinking for water to supply the Stanford mill, and will commence laying pipes from the Water Company's works....24th: The Earl is yielding fifty tons of high grade ore daily. ....*News*, 25th: Consolidated Chloride Flat sends 50 tons to mill daily....Cerro Pasco ore milled $165 per ton....Hidden Treasure shows exposed an immense mass of ore ....Manhattan is finding large bodies of good ore....Ora Dell is taking out some fine ore; a streak, nearly a foot thick, of very rich chlorides, has appeared in the south drift....Pogonip & Othello has 21 men employed; a quantity of ore is sent to mill daily....Tom Paine keeps a pack train constantly running with ore to mill; vein 15 feet; ore of high grade throughout.

Mills.—*Empire*, 21st: Dayton mill will start up about the 1st proximo on rock from the Original Hidden Treasure.... Miller's mill is crushing ore from the Sagebrush mine on Treasure Hill....22d: Stanford mill will steam up for a trial to-morrow, and about the last of the week will go into active operation.....Martin & Co's mill, in Patterson district, which went into operation last Monday, is said to work like a charm.. ..*News*, 21st: In Treglown's mill the frame is all up, the machinery on the ground, and will be in operation in two weeks.

Lead Bullion.—*Empire*, 25th; We were yesterday shown another fine lot of bullion smelted by W. T. E. Prichard, at his furnace in Swansea, from ores taken from the Maria Louisa, Roschud and Big Sunflower claims, owned by Mr. Sublett and others. The value of the bullion is over $200 per ton.

Oregon.

Canyon City.—Cor. of Dalles *Mountaineer*, Sept. 17th: In the mines but little is doing, on account of the scarcity of water. Canon creek is the only stream that has held out, and in it the water has been limited, more so than any previous season; yet the prospect for a good run this fall is quite flattering. There is some prospect of a bed-rock flume in Cañon creek, which will give an outlet for many valuable claims, and furnish employment for hundreds of men. The quartz mill at Marysville is pounding away with good results. The mills on Elk will start next week.

The "Portland Oregonian."—Since railroad and telegraph extensions to the north are beginning to assume the status of facts accomplished, the great empire of the Columbia, the Wallamette and Puget Sound—which is destined some day to weigh as in a balance against California—has attracted more of its merited attention; and papers from that region, such as the *Oregonian* of Portland, appear to us surprisingly well edited, and metropolitan looking with compactness and fullness of news, for a region that has not yet claimed to be itself the very center of the world. Doubtless there are the epokes now being made for a veritable hub in that region; but Oregon is as yet like a modest boy, in the lustiness of his growth. There is to be found in the Portland *Weekly Oregonian* as much news of manufacturing, engineering and the like substantial developments, as there is in any California weekly that could be mentioned, except the Mining and Scientific Press. Oregon has trees enough to insure a healthy growth of soul in its population; and summer showers when we are parching, unless we go rusticating to Lake Tahoe. Humboldt said the future great center of the world's civilization would be within five hundred miles of San Francisco Bay. It seems he could not determine in his own mind between California and Oregon.

Hucks' & Lambert's Axle Grease.—Hucks & Lambert make the usual display of their well known lubricating material. One of the peculiarities of this preparation is the fact that while it continues at nearly the consistency of cream, at ordinary temperatures, it does not yield to the action of heat, so as to liquefy, until the temperature is raised to about 200° Fah. It will not "run" in the hottest sun; hence its peculiar adaptability as an axle grease for cog-wheels and for lubricating journals, which are liable, from over-pressure or great speed, to become heated. This preparation is produced by a chemical combination of suitable oily substances, purified by distillation, and carefully freed from the resinous or pitchy matter which is found to a greater or less extent in all oils in their natural state, and which, if allowed to pass into the lubricating material, causes gumming and other hindrances to lubrication.

Adolph Sutro broke ground Sept. 27th for the deep tunnel which is to tap the Comstock lode at Virginia City. It is to reach the Comstock lode in a distance of 20,178 feet, and cut the vein at a perpendicular depth of 1,822 feet, or at a depth of 2,900 below the old office of the Gould & Curry.

Mr. Seward says Alaska is an honest climate, for it makes no pretensions to constancy.

Paddle Your Own Canoe.—Judge S. gave his son a thousand dollars, telling him to go to college and graduate. The son returned at the end of the Freshmen year without a dollar and with several ugly habits. About the close of the vacation the Judge said to his son: "Well, William, are you going to college this year?"

"Have no money, father."

"But I gave you a thousand dollars to graduate on."

"It's all gone, father."

"Very well, my son; it was all I could give you. You can't stay here; you must now pay your own way in the world."

A new light broke in upon the vision of the astonished young man. He accommodated himself to the situation; he left home, made his way to college, graduated at the head of his class, studied law, became Governor of the State of New York, entered the Cabinet of the President of the United States, and has made a record for himself that will not soon die, being none other than William H. Seward.

Piston Packing.—The water-packing patent exhibited by Mr. J. L. Constable, the chief engineer of the Institute Fair, has attracted attention, and received favorable comment from engineers for its simplicity. It is, in fact, no packing at all, but a series of grooves around the periphery of the piston, into which the steam forces itself, there condensing, and the water thereupon forming a perfect steam packing. It is the invention of Peter Poillen, and is a case where a mere idea, and nothing besides, proves to be a complete substitute for all the friction metals and costly appliances that have been attempted at so great a cost, for the purpose of securing a perfect piston packing.

A successful California miner who has just returned from a visit to his native place in New Hampshire, reports that there is much more difficulty there in finding help on the farms and in the interior, than is the case here—so many have left for Massachusetts, where manufacturing is carried on more extensively, and for the West. Young men do not, however, find the circumstances of the country such as to make it easy for them to "get a start" in the world. The chances to "get a start" are much more favorable in the Mississippi Valley or in California.

Whole-souled.—A new machine for cutting out the soles of shoes, may be seen at the Vulcan forges and machine shop on Howard street, near Beale, the invention of L. P. Garcin, the proprietor. It appears to work like a charm, a whole sole being cut at every turn of the machine by a single drop of the knife. The soles are turned out nearly as fast as the leather can be fed.

The seals did not stomach the Pacific Railroad. Five of them died, out of grief and venation, as soon as they came in sight of the cars, at the mere idea of traveling "the plains across," and looking for so many days out of the windows at the alkali flats. We have not heard of the like upon the Chinamen.

A Newspaper Runner.—One of the proprietors of the Sacramento *Bee* has been running ever since the Pacific Railroad was completed, and writing letters about running away; and now he has commenced writing about running back again. He's a mighty long-winded runner.

The great cask of Fulda & Co's California Wine Cooperage, Battery and Broadway, has made its appearance in the Fair. It holds 4,165 gallons.

The Schnell farm dwindles down to *eight* Japanese, four men and four women. Out of several million tea seeds sown, only 130 growing plants have resulted, but it is thought that the possibility of raising good tea in California will be demonstrated.

Next Monday, at 10 A. M., the State University at Oakland is to be inaugurated by addresses from Horatio Stebbins and others.

Self-Conceited.—Mrs. Stowe in a recent speech said: "Sins against taste are never pardoned. They bring nothing but loathing and disgust toward the whole subject; and you cannot reason with what disgusts."

The more a woman's waist is shaped like an hour glass the more it shows us that her sands of life are running out.

San Francisco:
Saturday Morning, Oct. 2, 1869.

From the Arctic.—A telegram from St. John, N. B., dated Sept. 27th, is as follows: "The expedition of Dr. Hayes and Bradford, the artist, has returned from the Arctic regions. They were entirely successful in every object. All well. They penetrated the middle ice in which the British whaler Alexander was crushed and lost." A New Bedford dispatch of same date says: "Dr. C. F. Hall, with Eibernburg and Loo Koolita, two Esquimaux and three daughters, arrived yesterday on the ship Ansel Gibbs, from Repulse Bay, Aug. 23d. Dr. Hall brings, as the results of his five years residence in the Arctic regions, interesting intelligence regarding the death of Sir John Franklin and company, and proof that none of them ever reached Moutreal Island."

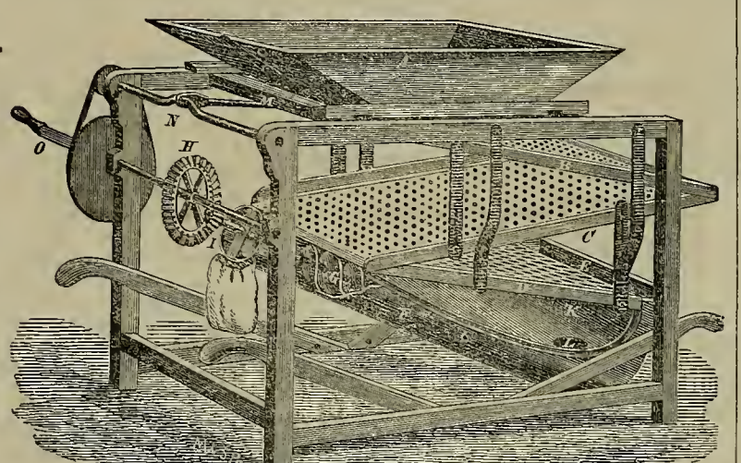
Mining and Metallurgical Statistics. We have sent to our subscribers in certain portions of the State, not otherwise provided for, blanks prepared by Mr. Raymond, the U. S. Mining Commissioner, which explain themselves, and which we hope will be promptly filled with a cheerful bestowal of such an amount of labor as may be required, and returned to us speedily, to be forwarded to Mr. Raymond, at Washington, for incorporation in his report. The results will be of great direct value and importance to the regions represented.

Chinese Portrait Painting.—A portrait of a San Francisco young lady, painted by Soy Lang, of Hongkong, after a photograph, shown in the Fair Art Gallery, is a good sample of Chinese skill and taste. In execution, color and tone, it is excellent; there is wanting, however, the same living element in the canvas which characterizes the ordinary photograph, and which can only be represented by the exercise of thought. There are few sign painters in San Francisco who could compete with Soy Lang. With proper schooling, we do not see why such artists of the Mongolian realm should not even excel amongst Caucasians.

A Patent Lifter and household tool of great merit can be seen on exhibition in the culinary department at the Fair. It is about the size of a stove-lid lifter, only a little heavier. It is very convenient for lifting hot dishes, pots, lids, etc., about a stove, and is also a complete carpet tool, stretcher, hammer and pincers; while it can be used for cracking nuts and for many other purposes. We rarely see so many merits combined in a little article sold for our bits.

Improved Grain Cleaner and Bluestone Mixer.

This device, of which we give an illustration to-day, is the invention of Mr. John W. Clark, and is designed to assist materially in the preparation of seed wheat. One of the worst difficulties to be encountered in sowing grain is the intermixing of barley, mustard and poor wheat, together with short straw and chaff, which latter would clog the seed-sower if allowed to remain. Much time and inventive talent have been expended to perfect some machine which should effectually separate the good wheat from these foreign substances. The present device accomplishes this by a simple arrangement of inclined screens, the upper one *(B)* of which receives the grain from a hopper, *A*, and a shaking motion being given to the screen, the wheat passes through, while most of the chaff, barley and larger substances are discharged from the lower end of the screen. A similar action occurs on the next screen, *C*, which is inclined in an opposite direction from *B*. From the screen *C* the grain passes to the fine screen *D*, which retains all the wheat, but discharges the mustard, cut wheat and cheat into an inclined hopper, *K*, from which it passes through an opening, *L*, to proper receptacles. The cleaned grain is passed from the screen *D* to a hopper, *E*, which carries it to the lower end of an inclined cylinder, *F*, which contains a solution of sulphate of copper, or "bluestone," as it is termed. This solution is for the purpose of preventing the attack of worms upon the seed, and for otherwise promoting the more vigorous growth of the wheat. The grain is thoroughly mixed with the solution; after which it is elevated to the mouth of the cylinder by a screen, *G*, which turns in the cylinder, and is operated by bevel gears, *H* and *I*. A sack is hung to the mouth of the cylinder, and receives the grain, which is freed of any superfluous moisture in its passage up the cylinder.



CLARK'S IMPROVED GRAIN-CLEANER AND BLUESTONE MIXER.

This machine is very simple and inexpensive, doing its work thoroughly; and we bespeak for it the attention of all farmers. One of these machines can be seen in the present Mechanics' Fair, where the inventor will give any information required. He may also be addressed at his residence, Hayward's, Alameda County, California.

Mr. Sutro's speech at Piper's Opera House, and the ground breaking ceremonies of the Sutro Tunnel at Corral Cañon, have afforded a lively subject for conversation at Virginia City, in which the newspapers generally speak encouragingly touching the enterprise, while a number, headed by the *Gold Hill News*, oppose and ridicule the present operation as futile. Mr. Sutro begins with $50,000 funds, subscribed by the Miners' Union of Virginia City.

Dull Times.

"Come again no more," sings the *Call*. The fact that everybody could raise the necessary cash pretty promptly on the last steamer day, is referred to as an evidence that the dull times in money and business are finally passing away. Such, we regret to say, is not the universal impression. On the contrary, though all the large and small craft have taken in their sail, months ago, the expectation is that this kind of weather will continue for a time, and that quite a number will be disabled. "The country is not large enough," we hear it urged; which means that the country is too large, and too little populated for the amount of business that is expected out of it. European and Asiatic emigration are canvassed, as incidental influences. We are in a transition state, and those who can read the times correctly, who will not go astray in regard to our proper destinies, will profit by their judgment. Often has it been said that "the mines are giving out," that the placers are exhausted in California. Amongst traders and money lenders, some of whom transact largely also in mining stocks, and amongst stock speculators pure and simple, we hear very frequently the opinion expressed that what we call honest mining will not pay.

The truth is that the entire country west of the Rocky Mountains is still dependent mainly upon the industry of mining. Our prosperity is exactly in the ratio of the gold, silver, lead, tin, quicksilver and coal mined and *brought to market*. Speculative placers and Montgomery street mining are entirely exhausted, and of course the surface placers of 1849 are exhausted; they were so ten years ago. Legitimate mining, with the proper skill, economy and intelligence, and metallurgical knowledge in proportion to the mining fields that are now well tested and found promising, is just begun, but is growing, and is that which will sustain and largely contribute to our prosperity for centuries to come.

To Mount Insects for the Microscope. Mounting small insects for the microscope, such as parasites and acari from birds, beetles, etc., may be performed by placing the live insect on the inside of a sheet of tolerably good note paper, folded, and when in the act of running, closing the paper and pressing it tightly in a book. By this means the legs and antennæ may be nicely extended, all the expressed moisture absorbed by the paper, and the skin left apparently unbroken. It should be allowed to remain in the book about two days, put in the turpentine bath, and afterward mounted in balsam in the usual way.

"Where is your father, bub?" said a gentleman to a ragged little boy. "He took a drop too much sir, and they put him in the ground," was the urchin's reply. He was hung.

Fairs, Everywhere.

An Industrial Exposition is a different thing from the ordinary ancient commercial fair, a kind of grand market-day which recurs periodically. The latter is instituted for the convenience of those who buy and sell, rather than for the advantage of manufacturers, inventors and producers, the fostering of general or special industries, by premiums and otherwise.

Trade fairs are as ancient and as universal as trade itself, but are rather oriental than Anglician in their style of business. We have our periodical book sales; but in corn, stocks and the like, modern commerce prefers to organize boards which serve as continuously existing fairs; while in common goods of the shops and stores, the oriental custom of holding fairs seems to be dispensed with by us. On continental Europe, however, the annual *Leipzig Messe*, and in Russia the great fair of Nijui Novgorod on the Volga, are kept up with religious regularity, and are as much a necessity to the people's method as advertising is with us.

Great times and occasions they are, for study of character, and for a comparison of various national characteristics; for from the most unvisited and uncorrupted nooks of the world and of civilization, come forth the living human fossils whereby we may classify the human species, and even read the history of our civilization back as far as a thousand years by the Rip Van Winkles that come to the light. These are good fields for beginnings in a science of human paleontology; as well as for a kindred science of caste-ology, for men are of many kinds differing mentally and morally from each other about as widely, it strikes one, as the grand scale of gradation between the lowest and the highest organisms in the physical world.

Glancing over the newspapers, we discover notices of fairs being held everywhere. The *Leipziger Messe* is even now on the tapis; many of the attendants in the Mechanics' Institute Pavilion have amused themselves in the midst of its curiosities, and learned to diognosticate the financial genius of Teutonic and Slavonian Jews. Nijni Novgorod is about winding up—of all places in the world for the study of caste the place worth visiting; for it is Asia, ancient and modern, and Europe, ancient and modern, in a state of the sublimest jumbled confusion, and jollity withal; Tartars, Mongols, Cossacks, Slavonians and Goths, including the genus Yankee, all showing on the surface the peculiar habits of feeling and thought of to-day, yet which reminds a spectator from the far West so much of the past, of an age ago.

Go over the Ural, or flit across the lands that Alexander conquered (when he thought he had it all), and rest in Thibet; everywhere you will notice that the people are holding annual fairs—seasons of brushing up and of jollification—even to the extreme highlands of the Asiatic continent, ten thousand feet above the sea, the fairs of which were so graphically described to us by Robert Schlagintweit in his recent visit to San Francisco.

The idea of the modern Industrial Fairs—of the World's Fairs and of Expositions Universelle—is born of Atlantic progress; and progress in what? In the exercise of the mighty powers of invention. As individuals, men are mere animals without tools; as nations, we are aborigines without inventions and machines; or we are absolute sovereigns, reigning in the midst of the physical forces of God's world.

The Mechanics' Institutes, dating from the beginning of the present century; the American Institute, now holding its thirty-eighth annual fair at Empire Rink, New York, and hosts of other similar institutions, were intended to cultivate and foster inventions for industrial progress—to facil-

itate and hasten the rewards for the successful meritorious inventor, even as to the smallest trifles that serve us a good purpose. We have learned what vast results can come from the simplest ideas of our every-day knowledge—as from the use of the expansiveness of steam. Without this feature in our fairs we would not be differing so much in our habits and ways, from the Tartars or the Persians of Nijin Novgorod.

There is in operation in this State since the 28th instant, besides the Stockton and Sonoma Fairs, the Upper Sacramento Agricultural Society's Fair at Chico; and there is in progress the New York State Agricultural (racing) Fair at Utica, with similar agricultural fairs in other States. From England we learn by official Government announcement that another grand World's Fair is to be held in 1870, at Kensington, where arrangements are being made for the erection of another great new exhibition building. From Peru, also, we learn that several hundred thousand dollars have been appropriated for an industrial and agricultural fair, to be held next year at Lima. Thus invention and civilization go marching forward hand in hand, and America glories ever in being at the front.

New Patents Issued to Pacific Coast Inventors.

[From Official Reports to DEWEY & CO., U. S. and Foreign Patent Agents, and Publishers of the Mining and Scientific Press.]

For the Week Ending September 16th.

Chimney.—Peter Portois,, San Francisco, Cal.

Water Closet Valve.—W. Smith, San Francisco, Cal.

Mechanical Power.—Addison Waterhouse, San Francisco, Cal.

Stamp Mill.—Rice & Vandern, Central City, Colorado.

Projectile.—Abiather F. Potter, Oakland, Cal.

Spring Seat for Vehicles.—Samuel S. Simmons, Watsonville, Santa Cruz Co., Cal.

New Incorporations.

Mohawk M. Co.—Gold Flat, Nevada County, Cal. Sept. 27th. Capital stock, $250,000; divided into 2,500 shares. Trustees: Joseph M. Maguire, C. C. Palmer and G. W. Downey.

Dutch Flat Gravel and Cement Co. Placer County, Cal. Sept. 29th. Capital stock, $400,000; divided into 4,000 shares. Trustees: William Watt, S. D. Bosworth, R. F. Morrow, J. S. Kennedy and Geo. W. Beaver.

North American Consolidated M. Co. White Pine. Sept. 30th. Capital stock, $2,000,000; divided into 20,000 shares. Trustees: J. F. Lewis, Thomas Wells, Jacob Bacon, J. A. Eaton, and G. R. Spinney.

Sewing Machine Manufacturing Co. The *Bulletin* announces that a company has been formed with a capital of $300,000, to manufacture sewing machines and needles.

Casala S. M. Co.—Sept. 25th. Trustees: J. Mora Moss, John Wright, Charles Meineicke, W. W. Arey, and Chas. Baum, Secretary.

Golden Sun M. Co.—Sept. 25th. Officers: President, S. Sheplar; Secretary, A. W. Chapia.

All Wrong.—An irresponsible item got mysteriously into our last number, describing Sloper's gas apparatus, (for the generating of illuminating gas with "sulphuric acid and iron filings, etc.), without the editor's revision or cognizance. The process being correctly described under its proper head in the Review of the Fair.

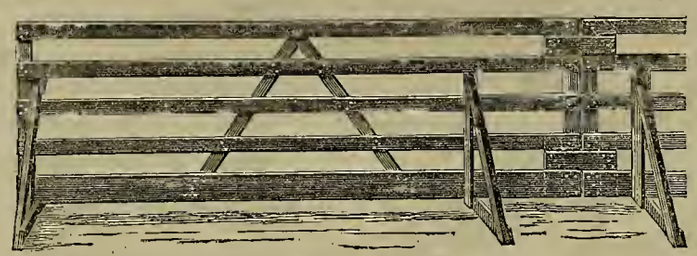
A Climatic Change is reported by an old trapper in the Rocky Mountains, who says that the winds there, now blow milder and damper than formerly, and the air is heavier. It has been observed also, that the rain falls more frequently in Utah and other portions of the Far West, and the rivers have increased in volume.—*Carson Appeal.*

We Hope he is Well Patronized.—A shoemaker on Kearny street, has a large sign over his store, on which is painted, "Good women's shoes made here."

Johnson's Patent Portable Fence.

Fences occupy no unimportant position in the industrial economy of a State. They are very expensive, and yet but few pay that attention to the questions they involve which their importance demands. Poor fences are great annoyances; they make breachy cattle, and keep the farmer constantly busy in repairing them. The manner of constructing them is almost indefinitely varied. Fences occupy and render useless, for production, a large portion of the area of a farm. There are but few who ever stop to make a calculation as to how much ground a fence occupies. The fence, as ordinarily constructed, around a six-acre field, will occupy nearly one entire acre. The fences on a farm of 160 acres, divided up into lots averaging six acres each, will cover over twenty acres of the area of such a farm. In the ordinary mode of fencing, the use of the land is not only lost, but the fence sides usually become a nursery of weeds, and greatly interfere with the plow.

In order to avoid some of these evils, the question of portable fences has been much considered, of late years, and great numbers of devices for such structures have been patented or suggested. The arguments in favor of portable fences are numerous. When properly constructed, they



Johnson's Patent Portable Fence—Fig. 1.

can be built cheaper than permanent ones; they can readily be moved from place to place, as desired, and no permanent loss is sustained in the product of the soil by means of their presence; and they never become nurseries of weeds.

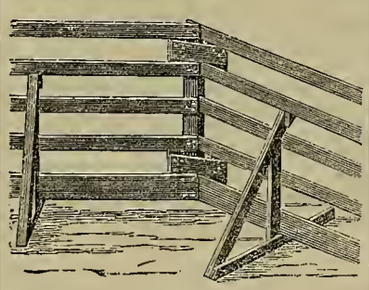


Fig. 2.

One of the best of this class of fences, which we have met with, is the one herewith illustrated, and which was patented, September 14th, 1869, through the Mining and Scientific Press Patent Agency. This fence can readily be taken to pieces or separated into panels. It can be built for about one-half the cost of an ordinary worm fence of the same height, with posts sunk in the ground; while the braces that support it make it amply firm and strong against either the inroads of cattle or the violence of winds. It can be placed along a side hill as well as on level ground; and it is claimed that three men can set up a mile of it in six hours. A model of this fence is shown at the office of the Fair Press, in the Mechanics' Pavilion, where the manner of its construction can be readily seen and its merits considered.

Referring to the engraving, the section, Figure 2, shows how the panels are held together; the ties are so constructed that the fence may be placed either in a straight line or bent into an angle at any panel. The brace on the right has been turned down, as is done in removing it from the fence. The braces upon Fig. 1, are in their proper position for supporting the fence. The act of removing or placing them is but the work of a moment; no hammer or other tool is necessary in setting up or taking down. The patentee will dispose of rights to build and use this fence through his agent, L. L. Sawyer, at the Pavilion, where any further information may be obtained.

The Mechanics' Institute and its Library.

It may be interesting to strangers visiting the city and the Pavilion, and to some others of our readers who may not be particularly posted in the matter, to learn something more than they may now know of the Society under whose auspices the present Industrial Exhibition is being given. The Mechanics' Institute of San Francisco was organized on the 29th of March, 1855. At the close of the first year it numbered only 92 who had paid their quarterly dues; while the library contained only 487 volumes. The Society had no building, or other property than its little nucleus of a library. Its first exhibition was given in May, 1857, which netted $2,678. From that small beginning the Institute has gradually increased to its present proportions and standard of usefulness.

Its library is now the most valuable on the Pacific Coast, in scientific and useful works, and is steadily growing in value. The number of volumes as per last quarterly report was 13,500 and additions are being made at the rate of 100 a month. The membership is not so large as it would be, if the merits of the Institution were more generally known; but the roll embraces 1,100 names, without counting life members, of whom there are about 70.

The Institute now owns the fine three story brick building occupied by the Association on Post street, subject to a mortgage, which, however, will be so materially reduced by the profits of the present exhibition, that the burden will not thereafter be felt. Besides the library hall, a large and fine room, the building comprises a commodious reading room, furnished with all the principal magazines and newspapers of the country, and a chess room, a most attractive place of resort for an evening.

Fully abreast of the requirements of the age, and in the best sense of the word, an eminently practical Society, the Mechanics' Institute has given many unmistakable proofs of its large public spirit and enlightened aims. The Fairs, originated and carried through by the unassisted resources of the Institute, have had a most marked and wide-spread influence on the manufacturing industry of the whole coast, and it would be difficult to name any organization that has done as much for the advancement of the best interests of our people. Seriously engaged in real usefulness, the Institute has not sought to attract the public attention to itself, and it is to this alone that we must attribute its comparatively slender list of members in a city which numbers its skilled mechanics by thousands. In the prosperity of this great center of education every good citizen must feel an interest, and it is the part of all to assist in extending its benefits to the young people of our city. Any one may become a member of the Institute by paying one dollar and fifty cents, entrance fee, with the same amount of quarterly dues in advance—a trifle which opens the doors to knowledge and recreation of the best and most wholesome character. Let any one consider the effect on the moral condition of the community, of a steady attendance at the reading rooms and libraries by the boys and young men now taking their first steps in life. What present would bear such priceless value to an intelligent youth as a membership in the Mechanics' Institute?

The Institute has recently established a Polytechnic Branch, before which free lectures of a useful nature are delivered on the first Thursday of every month. In order to make the usefulness of this department as wide-spread as possible, these lectures are free to all, whether members of the Institute or not. It is in contemplation to have these lectures more frequent as soon as the circumstances of the Institute will admit of the change. The next lecture before the Polytechnic will be given on Thursday evening of next week, at the reading room of the Institute on Post street, by David R. Smith, of this city.

Such associations as the Mechanics' Institute lay broad and deep foundations for enduring civilization.

Zinc-Silver Extraction.

Selby has bought from Judson, for $5,000, the right to use the Balbeck Zinc-Silver Extraction Process from argentiferous lead. This process has been in operation at Newark, N. J., for some time, where it was specially studied by Mr. Judson prior to purchasing it and introducing it in the acid works at the Mission. In principle, it is very nearly the same as the Parke process, the chief feature being a sloping iron hearth heated red hot, on which the zinc oxidizes and retains most of the silver in zinc dross, while the lead runs away. The only difficulty in the use, and the drawback to the general introduction of Parke's process as a substitute for Patinson crystallization, has been in separating advantageously the zinc from silver, and also in obtaining a commercially pure lead. This, Balbeck's process claims to have overcome. Pattinsonizing is done away with in the Harz and in the Rhine lead region, though not yet at Freiberg.

The process considered best at Clausthal, and used with perfectly satisfactory results, is the usual Parke process until it comes to the separation of the zinc. From silver this is effected by smelting in the cupola for rich-lead; the zinc oxide will go into the slag, and the lead will take to the silver, and go to cupellation. The poor-lead, containing still from one to one and a half per cent. of zinc, (enough to render lead unmarketable) is treated with sulphate of lead and carnallite (Mg Cl, but any other chloride, as salt, will do) which forms chloride of lead. This immediately chloridizes all the zinc, leaving the lead beautifully pure.

Railroad Building is to-day, as it has been for two years, one of the leading industries of California. Every landholder, land speculator, miner, and civil engineer, has in some degree of working up, a "railroad on the brain," and judging from the number and character of the railroad items found in our exchanges, a very considerable number of heretofore embryotic railroad schemes are on the verge of being born into the world of fact, requiring only the necessary time and conditions. It is the railroad age, and we are falling more and more into the use of railroads in lieu of common roads.

Pine Tree and Josephine Mines, Mariposa Estate.—The former mine, according to Mr. Goodsell's report, is in a condition to furnish 50 tons of rich ore daily. The latter employs Giant powder, single hand drills, and Chinese labor. On the entire estate there are seven crushers, three turbines, six steam engines, with 160-horse power, and 130 men employed. Mr. Goodsell counts upon $2,000 to $4,000 per day, as the practically possible product. The Ryerson amalgamator is still in use.

Prof. Augustus Steitz, of Helena, Montana, is to report upon the mineral resources and mining of that region, for Mr. Raymond's next annual report to Congress, the Commissioner finding it impossible for him to visit the Territory in person. The *New North West* grumbles, but admits that Montana has been well represented in the Rose Browne and Raymond reports thus far.

The California Laurel Wood.

Among the countless benefits the Fairs of the Mechanics' Institute of San Francisco have conferred on the industries of the Pacific coast, none are so clearly traceable as the present condition of the various branches of manufactures in which the California laurel wood is used. It is but a few years ago when this beautiful wood was extensively as fuel. It was chiefly through the display of its beauty when made into articles for exhibition at these Fairs, that its merits as a material for the cahinet-maker's use were developed; and now it is admitted there is no other wood in the world that equals the California laurel for that purpose. It possesses great strength and durability, can be cut in veneers as thin as writing paper, and is then almost as tough and pliable as cloth. It is readily stained to any color, and is susceptible of a polish equal to the finest mirror, which it retains for years. It may be obtained in sheets of enormous size, as was demonstrated by the immense logs exhibited at the last and present Fair—a fact of much importance, since the introduction of machinery for cutting hard woods into veneers as a substitute for wall paper.

The superb and mammoth room erected in the present Fair, by Strahle & Hughes, the whole of which is formed of California laurel, is the best proof of the growing and anticipated importance of this beautiful wood for ornamental purposes. The gentlemen who have erected this elegant room are shrewd, intelligent men of business, and would not have expended their money and materials unless their enterprise possessed merit. They calculated that hereafter the wealthy citizens of this and other States will have their saloons and dining halls lined with the beautiful California laurel, the peculiar tint of which is better adapted for the reflection of light than any other, while its brilliant a permanent polish causes its surface to be equal to a mirror. There can be no reasonable doubt that an inspection of this elegant, unique and *recherche* wood at the Fair, will give a great impetus to the demand for this wood, proving conclusively that the rise and progress of the business thus created, is a result of the opportunities for exhibition afforded by the Mechanics' Institute Fairs.

PYROGRAPHIC ornamentation on wood, some beautiful specimens of which are exhibited in the Art Gallery hy Blyth & Wetherhee, the lumher dealers, is a process of hurning designs into wood with heated iron plates prepared for the purpose. Rich effects and artistic designs can he multiplied on wood at a trifling cost. It is another case of invention for the masses, in supplying art for the homes of the million.

BASE BALL.—In consequence of the attraction of the "Red Stocking" players, many persons are interested in the history of this game. It would be very hard to tell who originated hase hall, for in the earliest histories we have the game is mentioned. Homer describes it at length in the Odyssey. The Pœacian damsels played the game to music, and Alcinous associated it with music and dancing. It was the chief exercise of the youug Spartans. The Atheniaus once erected a statue to a famous pitcher hy the name of Aristouicus. At Rome it was played by all classes, young and old. Pliny gives us an account of a great player hy the name of Spurima. As played now the game is derived from the ancient English game of "Rouuders," reduced to a system.

EXTENSIVE BOX MANUFACTORY.—One hundred and twenty-five men and boys, including one Chinamau, receive employment at the hox factory of Hohhs, Gilmore & Co., on Market street in this city. Last year 1,200 kegs of nails and over 4,000,000 feet of lumher were worked up into hoxes, the gross sales for boxes, Central American mahogany, working of lumher, etc., reaching the sum of $280,000.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.
"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.

It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers or others will please inform us.

Spice from the Daily Fair Press.

Behind Time—the back of a clock.

How to prevent sea sickness—stay on the shore.

When is silence likely to get wet? When it reigns.

The ties that connect business men—adver-tise.

Woman lost us one paradise, but makes us another.

A First-rate fellow—An American back-woodsman.

The principal difference between luxury and a necessity is the price.

If you would look *spruce* in your old age, do not *pine* in your youth.

Why is a sickly child like a little bucket? Because it is a little pail—pale.

If you are not the head or tail of a donkey, what are you? No end of a donkey.

The White Pine daily papers consider twice a week often enough to publish.

Why is Berlin the most intemperate of cities? Because it is always on the Spree.

Why is a specimen of handwriting like a dead pig? Because it is done with the pen.

Shame!—We are informed that the profits of first rate perfumers are exactly seent per scent.

Punch thinks the poorest farmer in the land, if unable to feed his calves, can always graze his shins.

Prof. Silliman is the State liquor taster of Connecticut. A good many silly mon taste it on their own account in California.

Jones says the dirty story about Lord Byron and his sister, was not penned by the hand of a lady, but by Harriet Beecher's toe.

The "oldest man in Michigan" walked into a hive of bees the other day and was stung so seriously that now Michigan has no oldest man.

O'Leary gazing with astonishment upon an elephant in a menagarie, asked the keeper: What kind of a baste is that ating hay with his tail?

"What's your occupation?" asked a lawyer of a witness. "Miller." "What sort of a mill do you run?" "A giu mill," was the satisfactory reply.

An exchange gets off the following: "During the scarcity of water in Philadelphia it is proposed that the city hire Prince Arthur to reign over it."

A Joker delared that a blind man, by taking something from the breakfast table, recovered his sight. What did he take? He took a tea-cup and saucer (saw, sir.)

There are menny ways to find out how brave and how honest a man may be, but there aint no way to find out the extent ov his vanity.—*Josh Billings.*

"I Dread the fate of Abel," said a lady to her husband. "Why?" he inquired. "Because I am afraid your club will kill me, by keeping you away from home every night."

Mrs. Jones, a farmer's wife, says, "I believe I've got the tenderest hearted boys in the world. I can't tell one of them to fetch a pail of water but that he'll burst out a crying."

Don't be too anxious to solve a conundrum. We know a man who got two black eyes in endeavoring to find out the difference between a man and a woman fighting in the street.

The editor of one of the city papers is still talking about the "pluck" of the Harvards. That editor and the Harvards together afford a dish of sheep's-head and pluck, for such as like it.

During the recent jollification among the Germans in honor of the centennial anniversy of the great Humboldt, a party of Irishmen in New York attacked a procession, because they were not permitted to join it with banners and mottos to the honor of Hembold, the Buehu man.

A Clergyman who was consoling a young widow on the death of her husband, spoke in a very serious tone, remarking that he was one of the few—such a jewel of a Christian—you cannot find his equal, you well know. To which she sobbingly replied, with an almost broken heart: "I'll bet I will."

A Gentleman was describing to Douglas Jerrold the story of his courtship and marriage, how his wife had been brought up in a convent, and was on the point of taking the veil, when his presence burst upon her enraptured sight, and she accepted him as her husband. Jerrold listened to the end and then quietly remarked: "She simply thought you better than *nun*."

Pottery—Sacramento and Antioch.

What a place pottery occupies in history—or, more properly speaking, in archaeology and in historical geology. Books perish, inscriptions are subject to the crumbling influences of time. But pottery ware buries itself cosily underground, and remains intact for all time. The ancient Romans, and the still more ancient mound-builders of the Mississippi and of this country, have left their most remarkable records in pottery.

How universal are its uses. There are but few potteries in this State; yet it is a wide and splendid field—a promising one always to ingenuity, as to cheapness or excellence of production, or local originality of design; and we have as good material as there is anywhere in the world.

The most complete exhibition of California pottery at the Fair this year is made by Mr. N. Clark, of Sacramento, who undertakes merely the more utilitarian kinds, but made for a great variety of purposes, and in the best quality of product. Not only the pots, pipes, fire brick, etc., but the original substances are exhibited—porcelain clay and steatite, raw and prepared, burnt and ground—rendering this space in the Pavilion instructive as well as suggestive. Clark's fire brick appear to be equal to the best English.

Lobree's Antioch pottery is represented by a class of goods—a beautiful brown stone ware, which is adapted for artistic modeling, and which has a most pleasing effect. All that is needed here is an artist, to shape the clay into designs such as will satisfy the tastes of the wealthy, and the most liberal prices may be commanded. This ware is not expensive. Between articles for use and for ornament, the Antioch pottery should become a very extensive and prosperous establishment. Their display last year was a full and very fine one.

Shades of Squarza.—The successorship of the famous compounder of punches, whose familiar countenance is intrinsically associated with that subject itself, is represented at the Fair, says the *Call* reporter, by "Phister & Kittleberger, who purchased both the secret and the right to manufacture," etc. The *Call* is in error, and does great injustice to the real purchaser, Mr. A. Bona, who is well represented at the Fair, and will promptly produce such evidence of the facts as will convince any one,—not referring to the internal evidence, which he keeps in readiness as a clincher in the character and quality of the punches themselves. Bona is the "only genuine" Squarza punch man—no mistake.

Ayer's

Hair Vigor,

For restoring Gray Hair to its natural Vitality and Color.

A dressing which is at once agreeable, healthy, and effectual for preserving the hair. *Faded or gray hair is soon restored to its original color with the gloss and freshness of youth.* Thin hair is thickened, falling hair checked, and baldness often, though not always, cured by its use. Nothing can restore the hair where the follicles are destroyed, or the glands atrophied and decayed. But such as remain can be saved for usefulness by this application. Instead of fouling the hair with a pasty sediment, it will keep it clean and vigorous. Its occasional use will prevent the hair from turning gray or falling off, and consequently prevent baldness. Free from those deleterious substances which make some preparations dangerous and injurious to the hair, the Vigor can only benefit but not harm it. If wanted merely for a

HAIR DRESSING,

nothing else can be found so desirable. Containing neither oil nor dye, it does not soil white cambric, and yet lasts long on the hair, giving it a rich glossy lustre and a grateful perfume.

Prepared by Dr. J. C. Ayer & Co.,

Practical and Analytical Chemists,

LOWELL, MASS.

PRICE $1.00.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.

Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

J. M. BUFFINGTON,

Room 37 New Merchants' Exchange, California street, San Francisco 17v15-tf

New Almaden Vichy Water,

(CALIFORNIA VICHY WATER.)

FROM THE SPRINGS,

NEW ALMADEN,

Santa Clara County.

F. L. A. PIOCHE.....Proprietor.
O. CHAUVIN.....Agent.

OFFICE, 506 JACKSON STREET,

GENERAL DEPOT:

Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the venous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find in mineral waters in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever;* Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the indispositions peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever;* Gout, *when the patient is still able to walk;* Gravel, and in cases of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece

Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v18tf

CALIFORNIA TRUST COMPANY.

421 California St., San Francisco.

Capital, - - - - - $1,000,000.

HENRY L. DAVIS, President.
D. W. C. THOMPSON, Cashier.

This Company will transact all kinds of legitimate banking business on the most favorable terms.

Deposits received and accounts kept in Gold and Silver coin, or National currency, payable in kind.

Exchange drawn on New York in Gold or currency available at par in any part of the United States, and exchange furnished on Europe, India, China, etc., at lowest rates.

Collections and Disbursements made at all accessible points, and proceeds remitted without delay.

Interest allowed on Certificates of Deposit, Savings Accounts, Trust Funds, and on average daily balances of desirable check accounts.

Money to loan on U. S. Bonds, State, City and County Bonds, Local Stocks, Staple Merchandise, Real Estate and other good Securities.

The Company will act as correspondent for Banks and Bankers, and as agent in the transaction of all kinds of financial and trust business.

Bonds, Stocks, Papers, Jewelry, Silverware, etc., kept on special deposit in its large fire and burglar-proof vaults and safes, at moderate charges.

Trustees:

REVIEW OF THE FAIR.

Classification of Articles.

The number of classes into which the articles on exhibition have been divided the present year, has been greatly reduced from that of last—from thirty to twenty-one. The subdivisions of sections of classes have also been reduced in about the same proportion—from 17 last year to 10 this year. In our reports, we propose to take up these classes in their order, noticing, at length the most novel and important under this heading, and publishing in the catalogue every individual article in each class or section.

Class I.—Machinery for the Application of Power.

The sources of power or force available to the wants of man, after animal exertion are—wind power, water power, steam power or the motive power of heat, and electricity, another mode of the development of the power of heat. The machines or engines by which these powers have been adapted to the wants and uses of man, come naturally first under consideration, and have been purposely so placed in the present classification.

Of all the forces of nature which the ingenuity of man has adapted to his use and convenience, nothing as yet occupies a more prominent place than heat as developed through the agency of steam. The steam engine is ranked first among prime motors.

Much attention has been of late years devoted to improvements having for their object the economizing of fuel in the production of steam by modification in the construction of furnaces and furnace grates, and in the varied character of the fuel employed. There is an important novelty in this direction, shown at the present Exhibition. We allude to the device for burning crude petroleum employed in generating the steam, which we shall fully describe and illustrate within a day or two.

There is sufficient variety in the articles exhibited to enable those interested in the uses of the steam engine to study the subject to advantage. The large 150-horse power engine of Booth & Co. (16 by 30), is considered a fine specimen of a serviceable horizontal cut-off engine, where a large power is required, as in mines. C. O. Farciot's little silver giant, on the Mining and Scientific Press counter, a vertical engine of "one-flea power," was made from the first silver taken out of the Eberhardt mine, White Pine, and represents the opposite extreme from Booth's. For a smaller, economical and universally applicable engine, the double-acting oscillatory machine of H. B. Martin is represented in various sizes. This engine has very interesting and some excellent points, the main one being its simplicity and cheapness; and it is alterable, at only a small expense, into a water engine, where water supplies the pressure in the place of steam—and in that shape, if attached to another moter, it is, without any alteration, a pump, a water engine of this kind reversed, acting as a pump. As a water engine it is especially adapted to great head and little quantity. As an engine, the small cost of manufacture, and as a pump the quantity of water raised, as suction and force pump combined, are the advantages claimed. Squires & Wallace's engines are both fine products of apprentices skill that are worthy of regard. Portable engines for hoisting and for agricultural work, in the most approved forms, are those by Baker & Hamilton, and by Treadwell & Co. There are also represented new and original ideas in regard to regulators and piston packing, the merits of which are freely discussed or explained by very competent engineers. Turbine power can be studied in the Bodine Jonval (in operation) in the Leffel wheels. The other articles under this section have been already separately noticed, or will be referred to hereafter.

Class I.—Power.—Sec. 2—Hydraulics, Hydrostatics and Pneumatics.

The cost of a steam engine, say of about ten-horse power, is now so small—$400 for the oscillatory engine described yesterday—that nothing but the high priced fuel can be urged as a substantial reason for not preferring it to water power. A steam engine is available in every locality and for every purpose; but where fuel is cheap, water power is generally to be had likewise; and the turbine wheels now in use are cheaper still, with no cost for running whatever. The turbines are small, inexpensive iron castings, that can be made to fit under a pipe with the least preparation, and that furnish easily controllable and the cheapest stationary power, where water is to be had. For milling, and even for hoisting, they might in many cases be substituted for steam. Bodine Jonval lets the water through vertically in the direction of the flow, avoiding friction of deflection. It was illustrated and described in the Mining and Scientific Press of January 2, 1869.

The Leffel wheel, modified by Mr. A. Myers, of Portland, Oregon, as exhibited at the Fair, is a double turbine, fed from the periphery and discharging below, the chief peculiarity being the method employed of letting on and regulating the quantity of water. The buckets are spoon-shaped. Myers' modification is highly spoken of as a serviceable wheel.

Pumps fill up the rest of the hydraulic chapter, in the Fair. They are there in goodly numbers; the pumping costs being a very large item in every mine, and in many manufacturing establishments where fluids have to be transported. To obtain any idea of the comparative merits, one must devote half an hour to a tour in company with an expert. Steam pumps, *i. e.*, steam engine and pump combined, are much in vogue, especially for manufacturing establishments. Blake's steam pump, exhibited by Berry & Place, and driving Mr. Fuller's turbine adjoining, was illustrated and described in the Press of May 1st, '69. It is a beautifully working machine, and has got into common use as a boiler feeder of large engines. Two other similar steam pumps are the Walmsley and Smith pumps, which is larger, and the Hayes pump, the peculiarities of which are a convenient method of making all the valves easily accessible by having them placed in a taper plug, and in having two fly wheels. Cameron's fly wheel pumps will work as steam pumps on board ship, or as hand pumps by gangs of sailors. A large assortment is exhibited by Mr. Stoddart.

W. D. Hooker exhibits a new double-cylinder force pump of his own invention, which has the peculiarity and the merit of having only two valves, while all other pumps of the kind must have at least four. Instead of horizontal valves he uses *balls*, the working of which is very pretty to look at. The Gerrish submerged pump has a cylinder which rises and falls in the place of a plunger, with good effect. N. D. Laswell exhibits two force pumps of his own invention, in which he very ingeniously takes advantage of the pulsation in the water column, caused as in the action of the hydraulic ram, thereby gaining, as he claims, ten per cent. in the effectiveness. Martin's double-acting oscillating steam pump is identical with the hydraulic engine described yesterday, only reversed in its action—making what appears to be a most serviceable and convenient pump.

There are also on exhibition W. H. T. Clark's new patent pump, already illustrated and described in this paper, Cushing's well known Excelsior pump, and several others which have their good points, and will be found best adapted to special purposes; all of which were enumerated in our classified catalogue.

Class II.—Machinery and Tools Used in the Manufacturing and Producing Arts.

The department of machinery affords quite a number of articles of general interest and attraction, and the sight-seers are constantly clustered about some one or another of those in operation. The machines on exhibition are not all in operation; but the uses and manner of action of such as are, can be readily understood by visitors generally.

The rapid progress toward perfection and precision in the construction of machinery and machine tools, forms one of the most striking features in the history of mechanism. Although the more generally diffused and more perfect knowledge of the principles of mechanical and constructive science, which has obtained of late years, has led to the production of a great variety of machines for almost every description of work; still new ones are constantly being sent forth to proclaim further and additional triumphs of mind over matter. Accumulated skill and increased experience has enabled the ingenious mechanic to devise machines which will perform the most delicate manipulations with mathematical accuracy, or shape the most ponderous forms which enter into the heaviest works of modern engineering.

But little more than half a century ago, nearly every piece of work had to be shaped to its required form by the tedious process of manual labor; and the world was almost entirely dependent on the dexterity of the hand and correctness of the eye for all mechanical accuracy. The first material step in advance of this almost entire dependence upon the hand and eye, was the introduction into mechanics of the *slide principle*, by Henry Mauldslay, of England. Upon that principle is founded every mechanical substitution of the human hand for holding, applying or directing the motion of a cutting tool to its work. Out of it has grown the *slide-rest*, now an indispensable portion of every lathe. But we have no time to follow such reflections, interesting and suggestive though they are; but must hasten to a brief notice of what we now have on exhibition at the Pavilion.

One of the chief attractions in the machinery department is Ford's Double Hook and Eye Machine, in which the ladies appear to be particularly interested. This machine is the first and only one ever built, which will make a hook and eye in one operation. It is the invention of Mr. J. T. Ford, a machinist in the employ of Messrs. Tubbs & Co., at their rope manufactory on the Potrero. It has been devised and entirely constructed by Mr. F. during his leisure, outside of working hours, and is a monument of ingenuity and patience.

The present perfection of machinery for making hooks and eyes has been gradually reached by one inventor after another. At first the wire was cut up into proper lengths by hand and fed, piece by piece, into one machine after another—the first making the two outside loops of the eye, with a straight piece of wire between, while another machine formed the central loop or eye. So with the hook, which was also made step by step, by a series of machines. After a while a machine was constructed which would take the wire from the reel, cut it at its proper lengths, form all parts of the eye and deliver it, when completed, into a proper receptacle. So with the hook, which, by the way, requires quite a different and more complicated process. The machine now in use for its manufacture has been gradually built up, as the eye machine has been, until it takes the wire direct from the reel and delivers a perfect hook.

Such was the condition of the machinery for this manufacture, when Mr. Ford took hold of it—two machines being required to do the work, each of which occupied a space of about four square feet. Mr. F. has now produced a single machine which occupies less than half the space of either of the old ones; and which at one operation, takes the wire from two separate reels, goes through the whole process, and drops the hook upon one side of the machine and the eye upon the other—equal numbers of each, for any given number of turns. These machines are perfectly automatic in their action, and a boy can tend eight or ten of them.

The old machines, two of which were required to perform the entire operation, could turn out only about sixty per minute. This single machine turns out 100 perfectly formed hooks and eyes each minute in which it is driven at its proper speed.

Some idea may be formed of the complex nature of the machine from the fact that it requires upwards of twenty motions to form a hook and eye. This is really one of the most useful and ingenious novelties presented at the Fair, and affords another illustration of the genius and originality of our California inventors. The entire machine is very compact and exceedingly simple for so complex a work. Its weight does not exceed 150 pounds.

Mr. George T. Pracy, sole agent for L. W. Pond's celebrated tools, exhibits two lathes, a patent punch, shears, an upright drill and four lathe chucks, all of Mr. Pond's make, and all tools of acknowledged excellence.

In the line of saws, Mr. George A. Day exhibits a jig belt-saw, with swivel table. These saws are made of three sizes. Mr. T. Stebbins also exhibits a jig saw, which is a California invention of much merit.

Otis Jackson, agent, exhibits one of Nichols & Adam's endless or band scroll saws, which is in operation every evening, and which forms quite an attractive feature in the exhibition. There is at present but one other saw of this description in California, the other being in use at the California mills. This saw is arranged to run over two pulleys, like an ordinary belt, passing through a table between the pulleys, on which the material to be sawed is placed; and as its motion is always one way, (downwards) tho stuff, by the very operation of sawing, is held firmly in its place. The advantages of this saw are found in its continuous action, and in the saving of power in doing its work by a continuous, instead of a reciprocating motion.

Messrs. Pilkington & Lane exhibit a machine which they call the Excelsior wood saw, and which consists of a common buck saw so mounted as to be driven by a crank motion. The machine is quite ingenious, and attracts a large crowd when in operation; but we apprehend all intelligent mechanics will agree with us that, so far as driving it by man-power is concerned, two men could do more work in a day with two buck saws, operated by hand, than they could by expending the same amount of strength in driving that machine. The loss will be equal to the entire sum of the friction of the machine. If power is to be applied at all to such work, it can be more economically done by the use of a circular saw.

Berry & Place exhibit quite a number of machine tools, more of which, we believe, are connected so as to be put in motion. We notice, among other things, an ingenious machine for turning such things as spools, wooden ware for toys, faucets, awl hafts, etc., a planing and matching machine, drilling machine and engine lathe. These tools are from their warehouse, 112 and 114 California street, where they have for sale the most extensive variety of machine tools on the Pacific Coast.

Messrs. J. Kindleberger and William A. Arnold exhibit three new California inventions—an Automatic Blind-shade Tenoning Machine, a Double-acting Blind Wiring Machine, and a Reversible Door Butt. These inventions,—which were made by Messrs. Kindleberger and Arnold, are the property of the Inventors' Association of San Francisco,—and are each important and valuable. The two first named are for use in the manufacture of window blinds, and are very important for the special work for which they are designed—saving in each instance, at least 50 per cent. of the labor required, over any other machine in use for the same work, and doing it equally well.

First we have the tenoning machine. In other machines employed for this work, the dressed slips intended for the slats are placed in the top of the machine, edgeways, turned by hand, and taken out by hand after they have been finished by the machine. In this invention, now exhibited, the strips are fed endwise into the end of the machine, which cuts the slats at the proper length, prepares the tenon on each end of the same, and delivers it automatically into a proper receptacle, all at one operation.

In operating the machine at present in use for "wiring," the first slat has to be placed in the machine and wired, and then another wire taken up and interlocked, by hand, with the wire already inserted, when the second slat is put in position for receiving its wire or staple, by the machine. From this description it will be observed that each slat has to be handled twice. By this machine both wires are inserted at one movement of the lever, and one man can easily do 50 per cent. more work than can be done with any other machine in use. In work where so much manual labor is required as in the manufacture of window blinds, the advantages of these machines are almost beyond calculation. Their general introduction into blind manufactories throughout the country, and throughout the world, in fact, will be a matter of necessity, as there is no other machine which can possibly compete with them.

Last, but not least, we have the Reversible Door Butt, which, by a simple change of the fillet—the work of an instant—can be used for either a right or left hand door. This butt, or hinge, is simple, strong and durable, and costs no more than those of ordinary make. The trader will find it for his advantage to keep these butts on hand, inasmuch as with them he can keep up an equally full stock at one half the investment now required for such goods. Of the butts at present in use he must keep as many left as right hand ones. When the same thing answers for both right and left, he can reduce his stock one half and do the same amount of business. We understand the inventors have been offered several thousand dollars for this patent, but no sum yet named has reached the value which they place upon it.

T. D. Young exhibits an engine lathe and a massive iron shaping and planing

machine, neither of which are in operation; but the principles and operations of both are well understood by mechanics. William Sellers also exhibits a shaping machine, and n two-inch bolt screwing machine. Baker & Hamilton exhibit n medium three-side molding machine. F. A. Huntington exhibits a shingle machine, not in operation.

Mr. A. S. Hallido exhibits in the machinery department n new invention of his own, which he denominates n grip pulley, from its peculiar mode of netion. Pulleys of this description are designed for nso where power is to he conveyed by ropes—particularly wire ropes. Where circumstances require n lnrge amount of power to be conveyed by the nso of small pulleys, the ropo over an ordinary pulley *will* slip. To guard against this, clip pulleys have been introduced, the most not able of which has been employed by Mr. Fowler, the inventor of the famous English steam plow, for the purpose of conveying the power from his engines across the large fields over which he drives his plows.

Mr. Hallidie has found the necessity for even n more efficient pulley than Mr. Fowler's in the multifarious uses to which his wire rope is applied. To meet that want he has dovised the one now on exhibition, which he calls a grip pulley, from its more tenacious grasp upon the rope. The improvement consists in an ingenious device by which the clips which surround the outer circumforeneo of the pulley are made to grip or hold on to the opposite "bites" of the rope while it is passing over the pulley. The instant the pressure of the rope comes upon these clips they close upon and grip it so as to prevent slipping, but let go automatically, the instant that pressure is removed. The principle is similar to that which causes the grip in the toes of birds. The instant the bird alights upon his perch, the pressure causes an involuntary contraction, by which it is kept in position and retains its place even after consciousness is lost in sleep; but when death ensues, the organism of the muscles ceaso to act, and the bird drops from its perch. This pulley will he found a very important aid in the use of wire or other rope for conveying power. Its action is very distinctly shown by pulling on one side of the rope thrown over it, as shown in the Pavilion; if it were thrown over an ordinary grooved pulley, it would he found to slip very readily; hut when thrown over this one, the friction or grip is sufficient to convey a very large amount of power—many times that which could he conveyed by a smooth groove, in fact, nearly the entire strength of the rope can he held in this grip.

Mr. Spaulding exhibits his pioneer carpet beating machine. Being in motion, its principles and operation may he distinetly seen and understood by all visitors.

There are two gas machines on exhibition—the Boston Union, exhibited by D. Simpson, which was fully described and illustrated in the FAIR PRESS of Septemher 22d; and Sloper's apparatus, exhibited by C. W. Stevens. In the latter apparatus, hydrogen gas is first generated by the immersion of iron filings in a dilute solution of sulphuric acid, the hydrogen being conveyed from the chamber where it is generated, into a chamber below, filled with gasoline, where it takes up its due proportion of earbon and is convorted into a fixed earbureted hydrogen gas of high illuminating power. The apparatus is ingenious, and works automatically—making gas only when it is being nsed. Efforts are being made to introduco this gas into general use in this city.

CHICAGO MACHINERY.—One large foundry and machine-shop in Chicago (Messrs. Preble & Co.) has determined to enter the market in competition with San Francisco, for the mill work of White Pine. Messrs. Prehle & Co. guarantee their prices for every charneter of machinery twenty-five per cent. eheaper than the like articles from San Francisco.—*Call.*

IMMIGRATION SOUTHWARD.—The San Jose *Mercury* of September 15th, says:

During the past week an average of ten wagons per day havo passed through this city, containing household goods and families, going into the southern portion of the State to settle. They are generally well supplied with live stock and children, both desirable acquisitions for the southern counties.

CONTINENTAL Life Insurance Co., 302 Montomery street, corner of Pino.

THE cigar makers of Chicago have been olding a convention. Their work all nded in smoke.

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

The following is a revised list of books interesting to our more special readers. The newest and most complete treatises on subjects within the scope of this paper, including local maps, pamphlets of value, etc., will be added from time to time:

ABBOTT, GORHAM D.—Mexico and the United States: Their Mutual Relations and Common Interests..... 2 00

ANTISELL.—The Manufacture of Photogenic or Hydro-Carbon Oils, from Coal and other Bituminous Substances, capable of supplying Burning Fluids. By Thomas Antisell, M. D. 1 vol. 8vo.. 3 00

BANCROFT'S Guide for the Pacific States 50

BARSTOW—Sulphurets; What they are, How Concentrated, How Assayed, and How Worked; With a Chapter on the Blow-pipe Assay of Minerals: 1 vol. 12mo. cloth 1 00

BLAKE, W. P.—Annotated Catalogue of California Minerals. 8vo 50

BLAKE, (W. P.)—Report on the Precious Metals at the Paris Ex., 1869. (To be had through Members of Congress.)

BRACE, C. L.—The New West. 1 00

BROWNE, ROSS—Mineral Resources of the Pacific States. San Francisco, 1868..... 4 00

BOURNE (John)—Handbook of the Steam Engine. Illustrated. 2 vol. 12mo. cloth 2 25

CADWALADER'S Map and Description of White Pine. San Francisco, 1869..... 1 50

COTTA, B.—Lithology. London, 1867. ..... 3 00

CONGDON.—Mining Laws and Forms of California and Nevada, and the Mining Ordinances of Mexico. 184 pp. 8vo; flexible cloth; 1864..... 2 50

CROOKS & ROHRIG'S Translation of Kerl's Metallurgy (not yet received here in full)....

CRONISE (W. H. V.)—Natural Wealth of California..... 6 00

DANA'S Manual of Geology. Numerous Illustrations. 8vo. half morocco. Philadelphia, 1867. 6 75

DANA'S Text-Book of Geology. Illustrated. 12mo. cloth. Philadelphia. (School Edition) 1864... 2 25

DANA'S System of Mineralogy. New Edition. 8vo. cloth..... 10 00

DANA'S Manual of Mineralogy. Revised edition, 1863..... 10 00

ELDERHORST'S Blowpipe.—Analysis and Determinative Mineralogy. Third edition, revised. 8vo. cloth. Philadelphia, 1866..... 2 50

EVANS—White Pine. 25

FREY & WELL'S Topographical Railroad and County Map of California and Nevada.. 1 50

FEUCHTWANGER — Treatise on Gems. 6 00

GOODYEAR'S Translation. A Treatise on the Assaying of Copper, Silver, Lead, Gold and Mercury, from the German of Th. Bodeman and Bruno Kerl. 1 vol. 12mo. cloth..... 2 50

HITTEL'S (JOHN S.)—Resources of California; comprising Agriculture, Mining, Geography, Climate, Commerce, etc., etc; the Past and Future Development of the State. 12m., cloth. 1 50

HOSKOLD'S Practical Treatise on Mining Land and Railway Surveying, Engineering, Etc. 1 vol. 8vo. cloth..... 16 00

KUSTEL.—Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada; also, a description of the General Metallurgy of Silver Ores. By Guido Kustel, Mining Engineer. Illustrated by accurate engraving. 1 vol. 8vo cloth..... 5 00

KUSTEL.—A Treatise on Concentration of all Kinds of Ores; including the Chlorination Process for Gold bearing Sulphurets, Arsenurets, and Gold and Silver Ores Generally. By Guido Kustel, Mining Engineer and Metallurgist. Illustrated with 120 diagrams on 7 plates. 1 vol 8vo. cloth..... 7 50

LAMBORN.—Rudimental Treatise on the Metallurgy of Copper. 1 vol. 12mo. limp cloth. Illustrated 1 00

MITCHELL'S Manual of Practical Assaying. 1 vol. 8vo. cloth..... 10 50

MAKINS.—A Manual of Metallurgy, more particularly of the Precious Metals, including the Methods of Assaying them. By G. H. Makins. 1 vol. 12mo. cloth. Illustrated by upwards of 50 engravings..... 3 50

MAPS—Of Oregon, Idaho, Mexico, White Pine, etc., can be had at Bancroft's and Gensoul's.

OVERMAN (Fred.)—A Treatise on Metallurgy; comprising Mining, and General and Particular Metallurgical Operations. 1 vol 8vo. cloth. 7 50

PHILLIPS (J. ARTHUR) — Mining and Metallurgy of Gold and Silver. New edition.) 8vo. Cloth..... 15 00

PERCY (John).—Metallurgy; the Art of Extracting Metals from their Ores, and adapting them to various Purposes of Manufacture. Iron and Steel. 1 vol. 8vo. cloth. 13 50

PLYMPTON—Practical Use of Blowpipe. 1868..... 2 00

Practical Use of the Blowpipe; being a Graduated Course of Analysis. 12mo. cloth. New York, 1858 ..... 2 00

SCOFFERN'S Useful Metals and their Alloys. 1 vol. cloth..... 5 50

SIMONIN, L.—Underground Life; or, Mines and Miners. Edited by H. W. Barstow, F. B. S. 160 wood engravings, 20 maps (colored), and 10 plates of metals and minerals in chromo-lithography..... 18 00

SIMONIN, L.—Underground Life, or Mines Miners..... 18 00

URE'S Dictionary of Arts, Manufactures, and Mines. 2,300 Engravings. From last London edition. 3 vols. 8vo. cloth. New York..... 16 50

WHEELER & RANDALL'S Quartz Operator's Handbook. Flexible cloth, 12mo. San Francisco 1865..... 1 00

WHITNEY.—A Geological Survey of California. Report of Field Work from 1860 to 1864. By J. D. Whitney. Per. vol quarto..... 6 00

YALE'S Mining Claims and Water Rights. 8vo..... 7 50

Any of the above Books will be furnished by return mail or express, on receipt of the price with postage added. Any other books desired will also be furnished at the lowest San Francisco retail prices. Address,

DEWEY & Co.,
Mining and Scientific Press Office, San Francisco.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1810, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors la different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY. and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

New Mining Advertisements.

Bucklin Silver Mining Company.—Location of Works: White Pine District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of September, 1869, an assessment of five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 49 Merchants' Exchange, California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the sixth day of November, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday, the twenty-sixth day of November, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

S. D'ELL STONE, Secretary.

Office, No. 49 Merchants' Exchange, California street, San Francisco. oct2

And in accordance with law, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Wells Mining Company, No. 439 California street, City of San Francisco, on the seventh day of October, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

GEO. H. RUSSELL, Secretary.

Office, No. 439 California street, San Francisco. se25

Notice.—The adjourned Annual Meeting of the Stockholders of the WASHTELLO MINING COMPANY will be held on MONDAY, October 18th, 1869, at the office of J. F. Hubbard, Esq., Room No. 3, Hayward's Building, California street, at 8 o'clock P. M.

DANIEL McLEOD, Secretary.

San Francisco, Sept. 24, 1869. se25 2w

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low. jly17tf

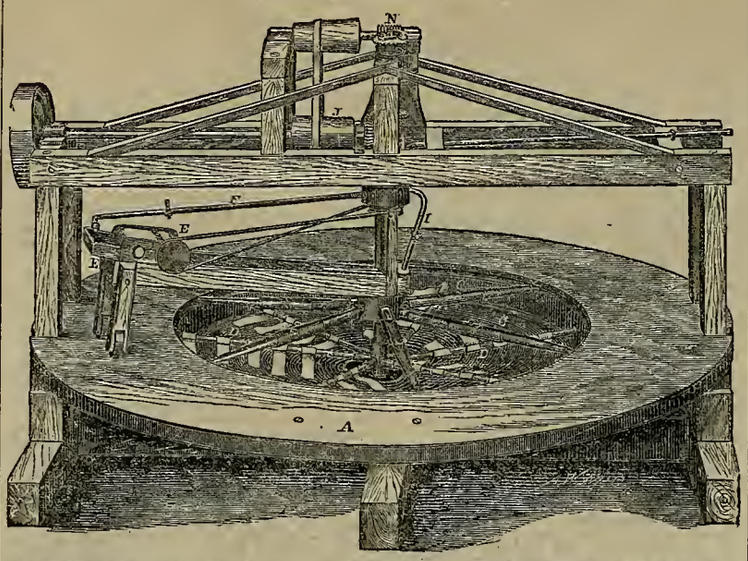
PAINE & STEPHENS'

IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.



ne Machine, costing about $1,300, is sufficient to work the Sands from 25 to 30 Stamps,

Less power being required than for any other Machine. The attention of quartz millmen throughout the State is directed to the subjoined certificates, and if they desire they can visit the Amador Mining Co's mill, near Sutter Creek, the Eureka Co's mill at Grass Valley, or the Banner Co's mill near Nevada, and see for themselves.

CERTIFCATES:

GRASS VALLEY, Jan. 4th, 1869.—This is to certify, that we have used the Paine, Stephens & Harry Concentrators for over twelve months. They have given us entire satisfaction, and are the best we ever used. WILLIAM WATT, Supt. Eureka Mine.

This is to certify, that we have had in use for the past 18 months one of Paine, Stephens & Co's Sulphuret Saving Machines, constructed by John T. Harry, (called a buddle,) and which operates satisfactorily, particularly so in saving fine sulphurets, and we recommend it as well worthy of use, even where other Concentrators are used above it, as it will pay if there are any sulphurets.

WM. L. TISDALE, Supt. Star Spangled Banner Mine.

NEVADA CITY, Oct. 26, 1868.

Any one wishing to purchase one of these useful machines, can do so by applying to THOS. N. PAINE, at Grass Valley, Nevada County, or JOHN T. HARRY, Sutter Creek, Amador County.

ELECTROTYPE ENGRAVINGS, CUTS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hanebrow's Patent Chatteuge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding months of delay requisite in transacting business through Eastern agencies.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is eminent evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, **229** Fremont street.

The Most Important Invention of the Day.

HALL & LEE'S

New Method of Packing Stationary Joints in Steam Engines,

—AND ALSO IN—

STEAM AND WATER PIPES.

BY THIS METHOD OF PACKING THE JOINTS ARE made perfectly steam-tight inside as well as outside, thereby effectually preventing the steam from cutting into the joints of the steam chest. Consequently, an Engine packed after this method will last twice as long as it will when other Packing is used; and the joints may be opened and closed every day, and they will be steam-tight every time they are closed, and the same Packing will remain good forever. Consequently, owners of mills will make a great saving, both in time and money, by having their engines packed by this method. Patented June 8th, 1869. By permission we refer to A. J. Binney, Supt. Northern California Railroad, and A. D. Starr & Co., Proprietors of the Buckeye Mill, Marysville State, County and Mill Rights for sale by A. H. HALL & H. T. LEE, Marysville, Cal. 6v12-3m

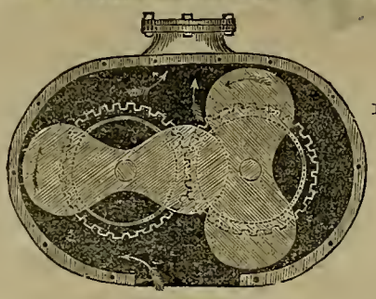
ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

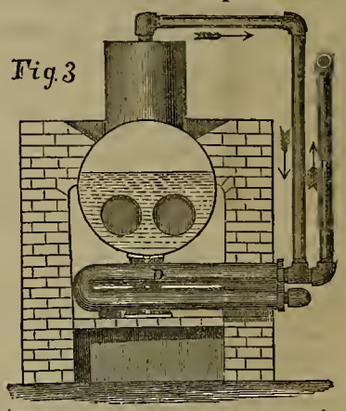
Important to every one using Steam for any purpose.

CARVALHO'S
Patent Steam Superheater



[SECTIONAL END VIEW OF BOILER, WITH SUPERHEATER.]

Saves Fuel! Saves Water! Saves Pressure!

Brief Extracts from letters from parties using Carvalho's Superheater. Full letters can be seen on application:

NAVY YARD, Washington, June 15, 1860.

"Superheater saves 12 per cent. in fuel and 10 per cent. more in speed of engine."

NAVY YARD, Washington, Oct. 8, 1867 (after seven years of service.)

"Superheater yet attached to boilers, and appears to be in good order."

HOWARD WATCH AND CLOCK CO., Boston, May 19, 1866.

"Superheater saves us at least 10 per cent. in fuel and gives a large increase of power."

JONES & SMITH, New York, March 21, 1867.

"Superheater saves 20 per cent. of coal, less steam pressure, exhaust more serviceable in drying paper."

STEAM ENGINE WORKS, South Brooklyn, April 23, 1867.

"Superheater saves not less than 20 per cent. fuel; no priming!"

CRICKETT LEATHER CLOTH CO., Newark, N. J., Oct 16, '67.

"Superheater economizes 25 per cent fuel; does our work with 25 lbs. less pressure steam, and steam superior for drying purposes."

N. Y. DYEING & PRINTING ESTAB., Oct 4, 1867.

"Superheater brings contents of our dye vats to boiling point in one-third less time and one-third less increase of water; saves us at least 15 per cent. fuel."

CONTINENTAL OIL REFINING CO., Binghampton, N. Y., Sept. 20, 1867.

"Superheaters give entire satisfaction, and we superheat to 550 deg—an increase of 200 deg."

CAROM MANUF. CO., So. Hadley Falls, Mass., Oct. 17, '67.

"Superheater saves 15 or 20 per cent. fuel; steam for paper mill now perfectly pure and dry—an important advantage in our business."

STATEN ISLAND FANCY DYEING ESTAB., June 18, 1867.

"Superheater saves at least 25 per cent. in fuel, and we have the advantage (hardly to be over-estimated) of perfectly dry steam."

ÆTNA IRON WORKS, San Francisco, Sept. 15, 1867.

"Superheater saves 25 to 30 per cent. in fuel; no priming."

CONTRA COSTA LAUNDRY, Oakland, July, 1868

"Superheater causes a use of 50 lbs. steam instead of 60 lbs.; use much less water, and there is a saving in fuel."

HAVILAH M. CO., Cal., August, 1868.

"Superheater causes a use of 40 lbs. steam instead of 60 lbs; use much less water, and there is a saving of fuel." (2 sets.)

SIXTH MECHANICS' INST. FAIR, S. F. Sept. 4, 1868.

"Superheater used proves that it saves fully 30 per cent. in fuel." (Chief Engineer.)

NEVADA MILL, Virginia City, May 30, 1869.

"Superheater is a perfect success, and saves three cords of wood in ten, or 33⅓ per cent. in fuel; engine works better."

And many other letters of the same tenor.

Awarded Silver Medal, Mechanics' Institute, San Francisco, 1868.

Awarded Silver Medal, Maryland Institute, Baltimore.

Awarded Silver Medal, American Institute, New York, 1865.

Our Patent Agency.

THE PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

REGISTER YOUR LETTERS containing money addressed to us, or we can not be responsible. Remittances by Express must be in packages, prepaid. When practicable, it is best to remit by draft, or order, on some San Francisco bank or firm.

A. L. DEWEY. W. B. EWER.

THE BEST IN AMERICA.

MINING AND SCIENTIFIC PRESS.

The Best MINING, FARMING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, and Engravers,

414 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises SIXTEEN PAGES (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS

All progressive information, in fact, transpiring with THE TIMES—which cannot be obtained from books.

The MINING AND SCIENTIFIC PRESS is now in its SEVENTEENTH VOLUME, and enjoys a large circulation It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1866:

RESOLVED, *That we regard a mining paper or journal of great importance to the mining interests of California and recommend he* MINING AND SCIENTIFIC PRESS, *of San Francisco, to the consideration and support of the miners of the Pacific coast.*

As an advertising medium throughout the whole Pacific States and Territories, the PRESS is unsurpassed. Rates moderate.

Terms of Subscription.—One year, $5; six months, $3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money orders.

DEWEY & CO.

OPINIONS OF THE PRESS.

MINING AND SCIENTIFIC PRESS.—The Mining and Scientific Press, published at San Francisco by Dewey & Co., is one of the most valuable of our exchanges.

Miners, mechanics, and the reading public generally, will find its regular perusal profitable and interesting.

Its scope and purpose are expressed in the title, and we recommend miners and mechanics in particular to subscribe for it. Terms $5 per annum, in advance.—*Trinity Journal, March 13th.*

MINING AND SCIENTIFIC PRESS.—This useful and scientific journal has entered upon its eighteenth volume To the scientific, mechanic, and practical men of al classes it is almost invaluable; and we are glad to learn that it is increasing in patronage every day.

The publishers, Dewey & Co., San Francisco, say the present volume shall be superior in all respects to its predecessors.

The terms are $5 in advance, $3 for six months.—*San Bernardino Guardian, March 6th.*

THE PRESS is one of the most valuable and instructive papers published in the United States, and every miner, millman, machinist and foundryman should he a subscriber. The information to he derived from its columns is worth many fold times the subscription.—*Grass Valley National.*

MINING AND SCIENTIFIC PRESS.—This excellent scientific journal has entered upon its eighteenth volume.—*Chico Courant, Jan. 15th.*

THE *Mining and Scientific Press* should have an extensive circulation in every mining community on the Coast.—*Placer Herald, Dec. 19.*

W. FRANK STEWART is Dewey & Co's accredited agent for the Patent business in this city, and will attend to their affairs in that specialty.—*San Jose Mercury.*

MINING AND SCIENTIFIC PRESS.—This journal is devoted to mining and scientific researches, and has been conducted with great ability. It has been greatly enlarged and improved.—*San Jose Patriot.*

THE MINING AND SCIENTIFIC PRESS has become almost indispensable to the miner and machinist, and is well deserving of the patronage which we are pleased to learn it receives.—*Mariposa Mail, Jan. 10th.*

THE PRESS is a credit to the State, and is fast gaining in popularity. It commends itself to all classes, and we hope many in this section will become subscribers.—*Pajaronian.*

THESE gentlemen not only print a first-class scientific and mining journal, but are also trustworthy Patent Agents, and doing much towards the inventive business of this coast.—*San Jose Mercury.*

THE MINING AND SCIENTIFIC PRESS commenced a new volume with the new year. It is a credit to the State, and to the mechanic or miner, is a great source of valuable information. It has every appearance of prosperity, and we hope it may continue growing in wealth and influence.—*Pajaronian.*

WE CONSIDER THE MINING AND SCIENTIFIC PRESS the most valuable mining and mechanical newspaper issued in the United States. Dewey & Co., publishers, are also solicitors of foreign and American patents and conduct patent cases of every kind. We guarantee that all business confided to them will be carefully attended to, and we furtber believe that every miner, mechanic, and scientific man should bave their valuable paper.—*Auburn Stars and Stripes.*

NEW VOLUME.—The MINING AND SCIENTIFIC PRESS has entered upon another year's work looking improved and promising. This paper is devoted to the interests of the scientific world, and to the miner and mechanic is almost invaluable.—*Gilroy Advocate.*

TO MINERS.—William H. Murray, traveling agent for the Mining and Sciutific Press, published by Dewey & Co., of San Francisco, is in town soliciting subscriptions for that paper. To the intelligent miner, a paper like the *Press* is particularly valuable, keeping him posted on the latest discoveries in reduction of ores, new machinery, etc.—*Grass Valley National.*

MINING AND SCIENTIFIC PRESS.—We look upon this paper as one of our most valuable exchanges, in fact it deservedly stands at the head of all publications embracing mining, scientific and mechanical subjects, and contains much miscellaneous matter of interest, and is a gem of neatness. The PRESS is published by Dewey & Co., San Francisco, and at its present low price of five dollars per annum, should be patronized by every one, but more especially by miners, mechanics and inventors who wish to pursue their avocations with intelligence and economy.—*Tidal Wave, Idaho.*

THE MINING AND SCIENTIFIC PRESS has entered upon its XVIIth Volume. It has donned a new-style hat; or, in newspaper parlance, a new heading, which gives it the solid, scientific look it merits. Other improvements typographical are also noticeable. No call for improvement in its matter.—*Amador Ledger, July 16th.*

THE MINING AND SCIENTIFIC PRESS, which commenced its seventeenth volume on the 4th, comes to us with a newly engraved head, and presenting otherwise its usual tasteful appearance. We take this occasion to say that the PRESS is one of the best papers of the kind in the United States, and every miner and mechanic in the State, as well as the business man, who would keep posted on our industrial resources, should have its name on its subscription books.—*Nevada Gazette.*

MINING AND SCIENTIFIC PRESS.—This excellent periodical has been for many years the faithful chronicler o important events and a medium of valuable information to the miners of the Pacific coast.

Subscription, $5 per annum; $3 for six months—in advance. Sample copies free.

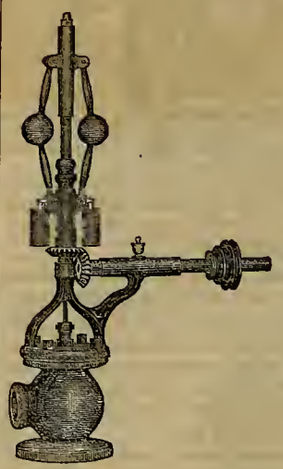
ELECTROTYPE ENGRAVINGS, CUTS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

GEORGE T. PRACY'S

MACHINE WORKS,

109 and 111 Mission Street, between Main and Spear,

SAN FRANCISCO.



MANUFACTURER OF

PRACY'S IMPROVED

Patent Steam Engine Governor,

The Simplest and Most Sensitive Governor Built.

This Governor is made of the best material, the shafts being of cast steel and the bearings small, thereby avoiding the use of heavy balls and springs, running at a high velocity and maintaining a uniform speed. All sizes of these Governors are kept constantly on hand, and can be seen in operation at my works.

I also take pleasure in informing the public that during my recent visit to the East I became SOLE AGENT for

L. W. POND'S CELEBRATED TOOLS,

ACKNOWLEDGED TO BE

THE BEST NOW MADE.

I shall keep constantly on hand all descriptions of

Lathes, Planers, Drills, Boring Mills, Milling Machines,

And every description of MACHINISTS' TOOLS, which I shall offer to the public at manufacturers' rates. Also

Morse's Twist Drills and Chucks of all kinds.

MANUFACTURER OF

ALL KINDS OF STEAM ENGINES AND MILL WORK GENERALLY.

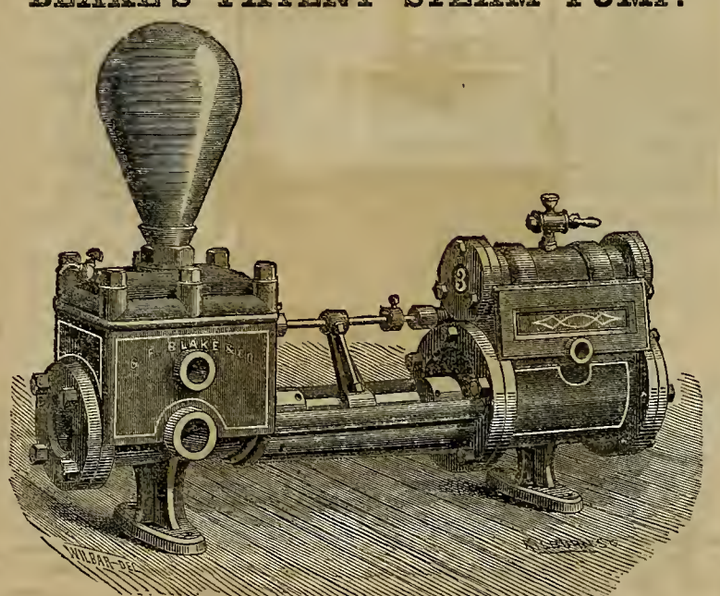
SOLE AGENT FOR TAFT'S PATENT SHEARS AND PUNCHES.

13v19 16ptf

BLAKE'S PATENT STEAM PUMP.



The Steam Pump, which is an independent Pump for steam engine and pump combined) is comparatively a new invention. It has, however, gained much favor with mechanics, and now seems to be coming into general use. The Pump, of which the accompanying engraving is a representation, is the invention of Mr. George F. Blake, of Boston A poor description only can be given of it without a diagram of its interior mechanism. The water cylinder is shown in the left hand side of the cut, underneath the air chamber. This cylinder may be made either of brass or cast iron; but brass valve seats, and both hard rubber and brass valves are used. The water is taken in at the lower aperture, and there are openings on both sides, for convenience of suction and discharge pipes. It is a double-action pump, having double water valves, which are very simple. The water is drawn in and forced out from both sides of the piston head, which, with the strong and ample copper air-chamber directly over the valves, keeps up a constant and large flow when the pump is in operation. The steam cylinder in ordinary sizes is about double the size of the water cylinder. The small cylinder, directly over the steam cylinder, contains the steam valve, which is operated entirely by steam, having an auxiliary valve, which is opened by the arm shown on the piston rod, with each stroke, just sufficient to allow the steam to work the main valve quickly. This main valve is cylindrical, and by a patent device of Mr. Blake's is perfectly balanced, thereby overcoming all friction or pressure of steam, and allowing it to slide with the greatest facility, as the steam is admitted at either end of the valve cylinder. The construction of the valve and auxiliary valve is such that IT IS IMPOSSIBLE for the piston TO STOP "ON THE CENTER," which was a general fault with steam pumps prior to adopting the plan of driving the valve itself by steam.

This Pump took the first prize at the Maryland Institute in 1868; the gold medal of the Middlesex Mechanic Association of Massachusetts, the same year, and the gold medal of the Massachusetts Charitable Mechanics' Association; the New Hampshire Mechanics' Association, and the Iowa State Fair, in 1867

It is positive under any pressure; may be run AS SLOW OR FAST AS MAY BE DESIRED; will discharge more water than others of same dimensions. The steam part being cast in one entire piece obviates the trouble of leaky joints. The steam valve is perfectly balanced, and it WILL START AT ANY POINT of the stroke, and discharge all the water of condensation. These Pumps are now very generally employed at the East as BOILER FEEDERS; in

SUGAR HOUSES, BREWERIES, TANNERIES, STEAMBOATS, Etc.,

And for MINING AND FIRE PURPOSES; twelve different sizes being now in the market, adapted to classes of work varying from a discharge of twenty to three thousand gallons per minute.

BERRY & PLACE,

SELLING AGENTS FOR PACIFIC STATES,

Crucibles.

The Patent Plumbago Crucible Co.,

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; chance of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869.—Messrs. A. S. Hallidie & Co., Agents Morgan Crucible:—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,

Melter and Refiner, U. S. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869.—Messrs. A. S. Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENBERG & MOORE.

Messrs A. S. Hallidie & Co.:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market. We have none equal to the above, and concede your claims for them. We think they will average 45 pourings of brass.

GALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869.—Messrs A. S. Hallidie & Co.—Gents:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Adus, Gautier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,

18v18-9p 519 Front street, San Francisco

MINING AND SCIENTIFIC PRESS.

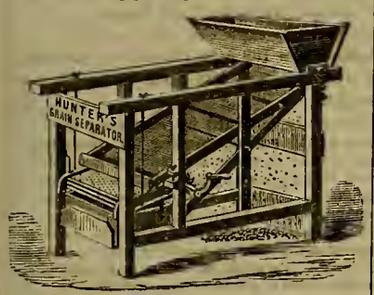
Subscription, $5 Per Annum. Single Copies, 12 1-2 Cents.

A Journal of Useful Arts, Science, Mining, Farming, and Mechanical Progress.

BY DEWEY & CO., Patent Solicitors. SAN FRANCISCO, SATURDAY, OCTOBER 9, 1869. VOLUME XIX. Number 15.

Hunter's Grain Separator.

We herewith give a small view of Hunter's Separator, which machine has been modified in its construction since illustrated in the last volume of the FAIR PRESS. This separator has been exhibited by its inventor at all the late Fairs of the Mechanics' Institute, and is now on exhibition, where visitors who are not already familiar with its workings can witness its operations. A view of the engraving and the following paragraph will give a tolerably good idea of its working principles.



By the use of cams and levers, a vertical jar motion is given to the chess screens, and a horizontal vibratory movement to the barley plates. The meshes of the chess screens are prevented from clogging by the constant taps which the chute receives from the cams and levers on the under side. The screens and plates are adjustable by set screws, so that the inclination and vibration can be nicely regulated.

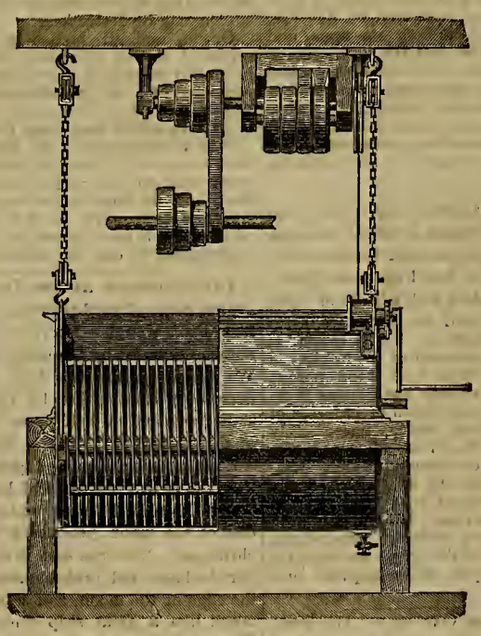
Hunter & Weister are the patentees, No. 218 Davis street, San Francisco.

"THE ARMSTRONG HEATER," so labelled, and placed near the main entrance to the machinery department, is exhibited by its manufacturers, Booth & Co., of the Union Foundry. This apparatus is designed as a heater and filterer for the feed-water of steam boilers. The one shown is not complete in its construction; as the openings for receiving the exhaust steam from the cylinder, for the discharge from the heater of the steam which is not condensed, for taking the heated and filtered water from the heater to the boiler, and for receiving the new water into the heater, are none of them shown. The interior of the cylinder is filled up by a succession of pans, such as are seen upon the floor near by, and the principle of its action is to receive the water into the upper pan, and allow it to trickle slowly down through the center and over the lips of the series of pans to the bottom; passing the while through the exhaust steam, taking up its heat and condensing a portion, and finally passing through a straw filter in the step projection at the bottom, from the outside of which it is taken to the boiler. These heaters are a late Eastern invention, where they are attracting considerable attention. We shall probably be able to give an illustrated description at an early day. Its principle may be seen and fully understood on application at the Union Foundry.

N. W. SPAULDING, of the Pacific Saw Company, was recently presented by the workmen in his establishment with a splendid cane, containing California quartz sage.

Rickard and Paul's Slum Amalgamator.

We take pleasure in illustrating, this week, Mr. Rickard's machine for the saving of larger percentages of gold and silver in argillaceous, calcareous and other light ores of these metals. Taking into consideration that the United States of America is now producing $75,000,000 annually, while Australia furnishes nearly $30,000,000 more, it follows that if the present rate of loss can only be reduced by ten per cent., the yearly saving of precious metals in these countries alone would amount to $10,500,000 by the introduction of this improved system of working. The average amount of loss sustained by the different gold and silver mining companies, by *all* the present systems of amalgamation, clearly shows, by assays of ore and tailings, that from all sources it is not less than fifty per cent. of the assay value of gold ore, and from thirty to forty per cent. in silver, and in some cases much greater.



RICKARD & PAUL'S SLUM AMALGAMATOR.

This machine having been expressly devised with a view to recovering the float gold and silver which has hitherto been lost in the slums—as well as the heavy metal obtained by ordinary methods of working—it is necessary to operate on the ore in charges or batches of half a ton, more or less, according to the size of the machine, or density of the ore, and to continue the action of the machine from half an hour upwards—that is, until the amalgamation is complete, which can be readily ascertained by assays of the tailings.

It is a very simple contrivance, as will be understood by reference to the engraving. A trough in which there revolves a series of amalgamated disks, arranged in screw form, so as to keep the pulp in constant motion to and fro. From numerous experiments, it is believed that the loss in amalgamation has been reduced from fifty to less than twenty per cent. in the case of gold ores, while its action has been equally effective with silver slums from the Comstock lode.

The following results from an experiment made on the 21st of January, 1869, illustrate the action of the machine. The ore operated on was from the Chontales mines, in Nicaragua, and, before amalgamation, assayed 5 ozs. 14 dwts. 8 grs. of gold per ton—$120. After half an hour's treatment in the machine a sample of the tailings was taken, which on being assayed gave but 16 dwts. 8 grs. ($17) of gold per ton; the action was continued, and other samples of the tailings taken at one, two, three and four hours, assays of which showed precisely the same proportion of gold as that taken at half an hour; proving that all the gold in a condition to be obtained had been separated from its earthy matrix in half an hour, the fourteen per cent. remaining in the pyritous tailings being recoverable by other systems of treatment. Where these ores are worked in batches or charges in pans, or other forms of amalgamating machines, the time consumed varies from three to eighteen hours. If the contents be heated by steam, or setting the machine over a fire like a boiler, the amalgamation will be accomplished in a much shorter time; but the inventors say they have had excellent results with cold water—say, 86 per cent. assay value of gold in half an hour's working.

As soon as the plates are completely covered with mercury they are to be fitted on to the screw flanges, and slipped on the axle, so as to form a continuous screw by means of a clamp attached to each plate, and three cross-bars of wrought iron running the entire length at right angles with the blades. These cross-bars assist materially in the agitation of the contents. Fifty to one hundred pounds of sodiumized mercury is introduced into the trough, and the screw lifted in, and fitted at about one-eighth or three-sixteenths of an inch from the bottom, so that the edge of each screw plate shall dip about one-fourth of an inch in the mercury. The charge of ore and water, not too thick, is now put in (the ore previously ground to a fineness that will pass through a sieve of sixty holes to the linear inch, and the finer the better), and the screw put in motion at the rate of ten to fifty revolutions per minute, and reversed every two or three minutes, or oftener, if it is found the ore travels too fast from end to end. This back and forward action of the screw dashes the particles of ore with violence, first on one side and then on the other of each amalgamated screw plate, which soon becomes coated with gold or silver amalgam, the excess of which flows off and mixes with the fluid mercury at the bottom of the trough or tank. The addition of one or two per cent. of salt in gold, and a larger proportion in silver ores, with or without sulphate of copper, is, in addition to the application of heat, as before stated, attended generally with beneficial results, by intensifying the electro-chemical action of the machine. The mercury is to be fortified from time to time (four, eight or twelve hours) by the introduction of a little solid sodium amalgam, composed of three parts sodium to ninety-seven parts mercury, the proportion of one part of this amalgam to 1,000 parts of mercury in the trough.

Tinned or galvanized (zinc) iron plates may in some cases be substituted for or used with copper, as, when properly cleaned, they will readily combine with the sodiumized mercury—they have the advantage of cheapness over copper, and intensify the electo-chemical action when used in combination with that metal.

When the machine is to be used for the purpose of washing or concentrating tailings, the speed of the screw is to be diminished sufficiently to permit the sulphides or other heavy minerals to subside to the bottom, while a stream of water carries off the light earthy matter through the top or middle plug hole, the machine being fed from time to time, until a sufficient quantity of concentrated matter has accumulated, when it is to be drawn off at the lowest hole.

To sum up, the special advantages claimed are, that, through the combined action of heat, galvanism, and great amalgamating surface presented to the auriferous or argentiferous particles contained in the slum or ore, by the rapid (lateral and reversible) motion communicated to the charge by the screw arrangement of the plates, these machines accomplish more perfect and rapid amalgamation than any other system hitherto known. They may be used with great advantage after the pan or other grinding amalgamator. One machine will operate on from twelve to twenty tons per day.

Further information as to capacity, prices, etc., may be had on application to Messrs H. J. Booth & Co., Union Foundry, San Francisco.

Mechanical Progress.

Steam-Jacketing Cylinders of Cornish Pumping Engines.

An article in the *Journal of the Franklin Institute*, by H. P. Birkinbine, C. E., questions the value of the steam jacket in effecting any economy of fuel, and expresses the opinion that it rather lessens the efficienoy of an engine. The loss by outward radiation from the cylinder is indeed prevented; but that from the outside of the jacket will he greater, becanse of its greater surface and becanse it is kept at a high temperature. A higher degree of expansion is possible with a steam jacketed cylinder, because heat is imparted by the steam in the jacket; but this heat must ho furnished from tbe boiler. In regard to refrigeration by the condenser, the writer says:

"In single-acting engines, snch as the Cornish, tbe loss is much less than in double-aoting engines, as the steam end of the oylinder is never directly connected with tbe condenser, the steam (nsually at ahout 202° Fah.) passing through the eqnilibrium passage into the other end of the cylinder hefore the exhanst is opened. When tho exhaust is open, the inside snrface of the cylinder is exposed to the cool ing effect of the condenser, and the steam in the jaoket is robbed of heat during the entire indoor stroke, or while the steam is doiug its work on the opposite side of tbe piston. This is not only waste power, but throws additional labor on the condensing npparatus. The accumulation of water in the oylinder oan be removed probably as effectnally and economioally hy admitting the steam into the oylinder at a temperature sufficiently above thnt necessry to perform the work, to absorb all the water. There may hnve been difficulty in doing this where steam was used at the low pressnre of from four to ten pounds, bnt it can readily he accomplished when the practice is to mnintain a pressure of from 30 to 45 ponnds."

A Nut-Cracker.—A recent English patent is for a machine for cracking palm nuts as a preliminary to the extraction of the oil. "A revolving fnn is used for producing a blast of air which throws the nnts with sufficient force against nn iron or metal target to crack them without injnring the kernels. The fan is inclosed in a sheet of iron, or other suitable case, having nn entrance passage, provided with a hopper for the introduction of the nnts, and a discharge pipe through whioh they nre driven by a current of air, and discharged against the target."

The Variable Cut Off.—The following is from a desoription of Wrigbt'e cut-off, in New York *Engineering:* "It has independent exhanst valves in the bottom of the cylinder, which are brought as close as practioable to the end of tbe cylinder, to obviate waste of steam in filling the passages. These are worked by a rod taking hold of the valve from the under side, the rod heing in the exhaust steam, thereby obviating the necessity of etuffing boxes in the live steam, and they are worked with the minimnm amonnt of friotion. The maximum preeeure on these valves is at the ends of the stroke, and they are relieved of the pressnre in proportion to the expaneion of the eteam in the cylinder during the stroke."

The Teleiconograph.—This is a new instrnment for making drawinge of distant objects, invented by M. Revoil, a French architect. The *Builder* says: "The principle ie that of allowing the image tranemitted hy the object-glass of a telescope to pass through a prism connected with the eye-piece. The rays of light are refracted by this prism, and thrown down upon a tshle placed below the eye-piece. The distance hetween the prism and the tahle determines the eize of the image projected on the latter, and it ie easy for the oheerver to trace on a paper placed on this sketching-table, the actual ontlinee indicated hy tbe refracted light.

The telescope is placed on a etand with screwe and clamps, allowing of botb borizontal and vertical motion, as it may often be necessary to give traverse to the instrnment to make a conneoted drawing of larger area than can be included in the object-glass at one view. The ndvantage poseessed by the Teleiconograph over the camera lucida is manifest. The size of the image may be determined at will. We have befors us a lithograph of the summit of one of ths towers of Notre Dams de Paris, taken by means of the instrument of M. Revoil, at the distance of 300 meters. It is 12 in. long. A sketch taken by the aid of a camera lucida is drawn along side, and is only one inch in length."

A Platinum Coating for Glass or Porcelain.

Prof. Böttger, of Frankfort, has pnblished a method for the prodnction of an uniform and lustrous plntinum film on glass, porcelain, earthenware, and the like. For the film to be deposited on glass or porcelain to be free from breaks, and have the lnster of silver, it is essentially necessary to prepare a chloride of platinum as free as possible from acid, and completely dry. The chloride, placed in a small porcelain mortar, is covered with oil of rosemary, and the two are kneadsd together, the oil being renewed till the brownish-red chloride is converted into a pitch-blnck paste-like mass, no longer containing visible particles of nnchanged chlorido. When the change appears complete the oil of rosemary is poured away, and the black product is further kneaded with five times its weigbt of oil of lavender, until they combine to a thin, completely homogenous fluid. The contents of tbo mortar need only he allowed to stand for half an hour, to be ready for use. On the object to be platinized, nn even thin cost of this preparation is laid with a soft hrusb; the thinner tbe film ths more lustrous it eventually bocomes. This done, the vessels are exposed in a mnffle, or with requisite caution over a Bunsen flame, to a feeble red-heat for a few minutes, which hrings out the lnster of the platinized surfacs. Should faults occur in a film, or portions of it be accidentally removed dnring the heating, hy a simple galvanic process this film of plntinum in its entirety can he removed from the vessel without the employment of aqua regia. It is merely necessary to cover the surface with bydrochloric acid, and touch it with a little rod of zinc; instantly, hy development of hydrogen on both its upper and under surface, the metallic film, which here plays tbe part of cathode, separates in an attenuated lnminated form, and in spite of great specific gravity, not unfrequently rises to the surface of the acid. Tbe platinum merely requires separation from tbe acid by filtration to recover it for further use.

Walls Made Water-proof.—The Ransome process of making artificial stone bss been npplied by the inventor to the rendering of the walls of buildings water-proof. They are first wsshed with silicate of soda, which is applied until the bricks are sstnrated. The strength of the solntion is regulated by the character of the brioks,—a heavier mixture being used upon porous walls. After the silicate has become thoroughly absorbed, n solntion of chloride of calcium is applied, which, immediately combining with the silicate, forms a perfectly insoluble compound, which completely fills up all the interstices in the brick or stone, without in any way altering its original nppearance. By this operation the wall is rendered perfectly water-tight, and, as the pores of the bricks are filled for a oonsiderable depth, no subsequent process is necessary.

Metallio Steam Gauges.—"The working part of these gaugee consists of a very flat box, in the form of a eection of a cylinder at right angles to its length. The top and bottom are made of brass and corrugated in a seriee of concentric circles, so as to make them very flexible and capable of being bulged outward by internal pressure. All that is necessary to ndapt this simple contrivance to the measnrement of steam pressure is to connect the interior epace by meane of a tube with the steam boiler, and to attacb to tbe top and bottom an nrrangement so as to enlarge small and scarcely perceptible motions into large ones. The last reqnirement is usnally fulfilled hy means of a donble lever attachment, ratchet wheel, pointer, and a dial."—*Manufacturer and Builder.*

Giant Powder at Hell Gate.—Prof. Maillefert is at work with dynamite on the rocks of Hell Gate. He has agreed, that by December 1st, there shall he 25 feet of water at menn low tide over Way's Reef, Pot Rock, and Shelldrake Reef. The first of these is 200 feet long by 100 feet wide. When he hegan upon it, August 2d, it had but 12½ feet of water over it. It now has over 18 feet.

Scientific Progress.

Chemical Reaction of Light.

Professor Morren has beon experimenting in the same direction with Professor Tyndall, upon the chemical reaction of light, making use of the solar light and inorganio substances, instead of,—as was the case with Prof. T.,—the electric light and organio bodies. We have not space to devote to a detail of Prof. M.'s experiments,—bnt we give, from *The Engineer*, the following conclusions which they induce him to admit:

"If a body is formed and maintained under certain oscillntory conditions, the pecnliar oscillntions of the atoms which oonstitute its molecules must differ from those in the medium in which the body has been prodnced. But if this body is transferred into another medium in which it meets with oscillations isochronons to those of its own atoms, these oscillations increase, and the *vis viva* which the atoms acquire may become so great as to drive the atoms heyond the radius of their sphero of action. The atomical edifice is demolished, and as the conetitntive atoms preserve nevertheless tbeir pecnliar affinities, they form a new edifice adapted to the oscillatory couditions in which they are now sitnated. Thns tbey escaps the shocks of the creating medium by ceasing to vibrate synchronicslly with that medium, exactly as an elastic sonorous body does not vibrate and gives no sound when the ærial vibrations which strike it nre not synchronous to those which it is capable of reproducing. But if the new edifice is again submitted to the action of other synchronous rays it is again demolished.

Most curions evolntions, wbich seem to ask of the chemist—(1) Under what peculiar circumstances and influences bodiee are formed? (2) Under what vibrations precisely their atoms oscillats? (3) Finally, under what other vibrations the molecular edifice may be destroyed?

Ozone, and all hodies capable themselves of nniting with otber bodies, would be simply molecules whose atoms would be possessed of a *vis viva* enfficient to animate and set in motion the ntoms of the other hody with which tbsy nnite themselves.

Will a *simple body* even always remain sucb for us, if it become possible to discover what oscillations bave assembled the atoms of its constitutive molecule, and what csn destroy it? Such is the question which the future lovers of natnre and science may be one day enabled to solve."

The Eclipse of August 7th.—The following picce of word-painting is an extract from Prof. Hough's description of the pbenomena as noted by the mnttoon observers. We find it in the *Gas-Light Journal* for September 16th, which, hy tbe way, gives some three and a half pages of nbstracts of papers resd at the Salem meeting of the American Association, and promises more: "As the light grew less and less, suddenly the sun seemed to pass under the hlack disk of the moon, producing a feeling of chilliness. Now was seen in all its eplendor the large red protuberance sitting on tbe edge of the moon, and appearing very much like a great ship under full sail. Farther to the left was another, nearly as large, with two hent rays, somewhat reeembling the antlers of a deer. Five others, not quite as large, were seen on different parte of the disk, all of a deep red oolor.

After looking with astonishment for a few eeconds, we proceeded to meaenre with the micrometer the height and positon of the largest flame. But jnet at the critical moment, fortnnately or unfortnnately, one of the hand rods for moving the telescope came off, and it was necessary to remove the eye from the tube to fix it. On looking up, one of the grandest spectacles met the eye of which it is possible to conceive. Surrounding the dark body of the moon was a orown of light with rays shooting out in five great eheaths, to a distance eqnal to tbe snn's diameter, or nearly a million of miles. For a time everything else was forgotten, and we gazed for eight or ten eeconds with astonishment, akin to awe, at this magnificent spectacle. No painting can represent it, and no pen can describe it. It ie one of tbose sights which must be seen to he appreciated. But we soon realized that precions moments were slipping away. The telescope was again brought in position, and the height of the large protuherance measured, and fonnd to be 0 2′ 45″, or more than 70,000 miles, 150,000 at the hsse.

While still gazing, a ray of light suddenly flashed out, and the total eclipse of August 7th was over."

Trout Monstrosities.—*The American Naturalist* has an article by Dr. Coolidge describing and figuring certain curious malformations wbich occasionally come under the notice of the trout breeders: "Sometimes, instead of there being one fish only attached to an umbilical vesicle, there are two; not two separate ones, hut two heads attached to one body, or two bodies attached to one tail. This curious partial duplication of the fish, takes place in the egg long hefore it is hatched, and is due, probably, to a bifnrcation, of ths furrow around which the backbone of the fisb is formed. The cells of the thickened oval spot, instead of forming one straight furrow, for some reason or other form ono in the shape of a Y. Two backhones form around ths two branches, with two heads, while one tail has to do for hoth. As far as has been observed, it is always the anterior part whioh is duplicated. No one body with two tails has been found. The tail remains single while the head and hody nre douhled; and this dnplication vsries from a partial division of the head only to two nearly complete fish, with different brnins, aud hearts, and stomachs, and whose hearts do not even beat together, though the circnlntion in the tail must be common to both."

Coohinilin.—This, the coloring matter of the cochineal insect, called also carminic acid, consists, according to De la Rue, of carhon, hydrogen, and oxygen, in the proportions expressed by the formnla $C_{28}H_{14}O_{16}$, or 168 parts of carbon, 14 parts of hydrogen, nnd 128 parts of oxygen by weight.

It may be obtained by digesting the insects in ether to remove the fat, dissolving the residue in water and adding acetnte of lead, when a lead carmine lake will be precipitated. This is washed, dissolved, and decomposed hy hydrosulphuric acid, which precipitatee the lead as a sulphide, leaving the carminio acid in solution, which is eeparated by evnporation. Carminic acid is a purple-brown friable mass, soluble in all proportions in alcohol and water, nnd nnchangeable by the nction of strong sulphuric or hydrochloric acid. It forms pnrple lakes with salts of copper zinc and silver; nnd with tin, a brigbt crimson. Very fine lakes are also prepared by its combination with fine gelatinous alumina.

Fevre on Hydrogenium.—M. Fevre states that nccording to his experiments, the hydrogen in palladinm saturated therewith is present as a chemical componnd, and not simply in tho state of condensed gas. He states also that the vapor of boiling mercury is as little n conductor of electricity as hydrogen, and that therefore the fact of the non-condnction by hydrogen of electricity cannot be regarded as an objection to its heing considered a metal.

Agassiz on Humboldt.—The oration of Prof. Agassiz in the Boston Music Hall, on Sept. 14th, the occasion of the Hnmboldt centennial celebration, fills seven and a half closely printed columns in the *Springfield Republican*. Humboldt was n personal friend of Agassiz. When Prnssian ambassador in Paris, he being sixty-two years of age, and Agassiz a young graduate of medicine of twenty-four, he gave bim permission to come to hie room as often as he pleased; and occasionally did him the honor—as Agassiz relates with pride—to seek him ent in his own lodging. No man living is better fitted than Agassiz, to deliver an oration on such an occasion. We may give extracts in fnture issnes.

New Compound of Lime and Sugar.—Messrs. Boivin and Loisean have formed n new combination of lime and sugar, which is prepared in the following manner: To 200 kilos. of syrnp contnining 60 per cent. of crystallizable sugar, 120 kilos. of caustic lime as a thickish milk of lime are added, and next carhonic acid gas is passed through tbe mixture. After some time a precipitato is formed, and as soon as it makes it appearance, 20 litres of tepid lime-water are added, and the stream of carhonio acid gas is stopped. The precipitate is the new compound, and it contains in 100 parts, 43 of sugar, 40 of lime, and 17 of carbonio acid.

REVIEW OF THE FAIR.

Classification of Articles.

CLASS II.

MISCELLANEOUS MACHINERY—Continued.

The most important article in this class is an original Californian—or rather Oregonian—invention, by Mr. J. W. Sutton, and is called the Rotation Dynamometer. We have already described it in these columns, and will here only add that we can think of no good reason why Mr. Sutton's invention should not be a perfect measurer of the exact amount of power used in any given machine to which its test may be applied. Its basis is the revolving force exerted upon an arrangement of spiral springs—but will be best understood from personal examination, under the explanation of Mr. Sutton, who is always on the ground. To the machinist, Sutton's dynamometer is an interesting machine. We are told that no rough work to which steam gearing may be applied, is so rough as to incapacitate the dynamometer from showing always the exact amount of power used. It might, for example, be used to measure the power used by the revolving cutters of the Standish steam plow. Questions of great importance as to comparisons of power in machine building can be determined with it by ocular demonstration.

But one windmill is in the catalogue this year, and that a very good one—the Atwood & Bodwell machine. Two working mills are in the yard—one attached to a Smith pump; and a fine model inside is running by the wind from Root's blower. The fan heads properly to the wind of its own accord, and by merely pulling a cord the wind itself will throw it out of gear and bring it to a standstill.

Johnson's hoist with "safety clutch," is again on exhibition. It is one of the most approved hoists for city purposes, as it is perfectly under control, and can be worked by hand by those standing on the cage.

Brick-making by machinery is represented by the two best made models in the fair. The model of the Douglas machine, exhibited by Mr. Williams, and run by Squires' little engine, is exquisite workmanship. This machine works dry, while the Rightington & Rider machine first mixes with water in the usual way. Two or three times the number can be made that a gang of men could turn out without the machine.

Quartz screens of various patterns are exhibited by M. Quick and by Booth & Co., Mr. Quick makes "slot cut," and "slot punched," shaker and other screens, the uses of which are well understood by mill men.

A hair and pulu picker, manufactured by William Lyne, of 115 Davis street, is the shoddy machine, which wearers of shoddy should examine while in operation, if they be not prejudiced against much dust.

Castagnino's "machine for inlaid work" would be worthy of examination if it could be found.

CLASS III.

MINING, QUARRYING AND METALLURGY.

The Mechanics' Fair does not contain everything that would be instructive in this department, nor even everything that is new or important—but a few of the most essential inventions, and enough to make an examination interesting, as well as instructive. The mills and pans draw the specialists together, and the working points are discussed, and objections are made and answered.

Mr. G. A. Taylor's steam stamp mill is one of the most prominent articles on exhibition; its substantial build, great size, and tremendous crushing power, attract the eye and gratify the imagination of every visitor to the Fair who has faith in the gold and silver-bearing capabilities of rock. Here is the giant contrivance (he thinks) that will compel a speedy and unconditional surrender,—for what mountains can withstand the blows so tirelessly repeated, of two such terrible fists.

The good points and advantages of the Taylor mill will receive fuller justice hereafter, as we understand that a mill of the kind is in operation in the mines not far from Stockton. Meantime, it is proper to state that objections are urged, such as that the cylinders are in the dust and jar of the stamps; that as large a steam cylinder on a separate engine would do as much work in the ordinary way, by raising ten stamps to one of these, or twenty for the work of the two; and that the engine would then be run smoothly and clearly in another room. Taylor's mill strikes 200 blows a minute, and gives each time a 2,000-pound blow. Thus in the compactest shape possible it does the work, we are told, of an ordinary 20-stamp mill. The inventor proposes to furnish this mill, and set it up, for the cost of *erecting alone* an ordinary 20-stamp battery, thereby enabling millmen to save the entire cost of their battery.

As it is found that stamps and dies wear away rapidly enough in stamping to make the loss of iron quite an item, Mr. J. W. Coffey exhibits a battery shoe and die which is both internally and externally chilled by a peculiar process, which effects a decided saving in the duration of the stamping irons. The Risdon Iron Works also exhibit shoes and dies which are claimed to have peculiar advantages, but the merits of which can only be determined by test of practice. There are two amalgamating pans—the Varney and Hepburn grinders—both great improvements upon the first pans invented. The Varney pan grinds with a cutting edge, which adapts it to a soft argillaceous gangue; while the Hepburn grinder operates by the friction of loose revolving disks, or cylindrical blocks on end—an arrangement adapted to a harder substance, and to fine pulverization. Pieces are thrown in of hickory nut size, and reduced more economically, it is claimed, during the process of amalgamation, than by any other means, not excepting the stamp mill. While the latter claim is not substantiated, and scarcely reasonable, it must be admitted that the Hepburn pan operates prettily as a grinder. A number of these pans have been tried at Virginia City, discontinued, and set to work again. An objection urged against them is that since the iron cannot be hardened evenly, the disks will grind down irregularly, and finally be thrown out of the circuit; but the owners of the pan deny that they are experiencing any such difficulty.

Varney's pan is a complete iron mill, having even its burr-furrows, partly filled with wood, and partly worn open by the action of the ore upon the exposed edges of the wooden slats.

A quartz mill with revolving stamps rotated by gearing, is exhibited by D. M. Hosmer. If the object of this is to save friction, it is rather a loss than a gain, for the friction of the gearing will be greater than that of the lifting cam.

Smelting is represented by Hanscom & Co's foundry cupola, which has been in actual use quite a number of times, to the edification of thousands of interested spectators. It is of boiler iron, lined with fire brick, and is furnished with blast by the Root blower. Lead smelting products, for the market, are exhibited by T. H. Selby.

Another quartz crushing and grinding machine consisting of two parts, is exhibited by Col. J. A. Collins, of Virginia City—a modification of the Chilian mill, and a hollow barrel containing balls, to pulverize fine. Both parts are complicated, and are somewhat adversely commented upon. Col. Collins has exercised much ingenuity, however, in devising these machines, and indeed, has built them over quite a number of times.

CLASS IV.

AGRICULTURAL MACHINERY, IMPLEMENTS AND TOOLS.

The labor of the farmers has been vastly ameliorated, of late years, by the rapid strides which have been made in the application of machinery to agriculture. Almost every variety of farm work is now mainly performed by machinery, and the wear and tear upon human sinew and muscle has been mostly transfered to inert matter. The cradle, the flail, the fan and the scythe have almost entirely disappeared, while the hoe and the old-fashioned single plow occupy but an unimportant position on the farm to what they once did. The entire work of farming has been revolutionized within the experience of the present generation.

With all this change, improvement in culture has also come. By the aid of improved plows the farmer is enabled to plow deeper and more thoroughly; while the cultivator does its work far more thoroughly than the hoe formerly did. The machine reaper, mower and thresher do their work far better, more thoroughly, and at infinitely less expense than the same work was done in the old-fashioned way.

In passing through the agricultural department at the Pavilion, the eye rests upon almost every class of machinery. We see there, first implements for the thorough pulverization of the soil; for sowing and dropping the seeds; for covering them evenly, when deposited on the earth. Then, when the tender plant makes its appearance and requires careful cultivation, we see the proper implements for doing that work; and so on, until it attains its full growth and maturity, and all with very little assistance from the hand-hoe, which is now generally considered quite antiquated in character.

When the cereals are ready for the harvest, we have innumerable appliances for cutting, handling, threshing, etc., and if we go out in our fields, we shall find a Californian invention, not shown in in the Pavilion, which at one operation cuts, threshes, separates, winnows, and sacks the wheat. There is scarcely an item of farm-labor that is not now done by mechanical contrivances, even to ditching, cutting down trees, and pulling up stakes and stumps. The practical mechanic and farmer now go hand in hand—the former sending forth from his shops mechanical helps that move and work at his will, and perform, with great celerity and excellence, the labor that formerly had to be done by the muscle and sinew of the farmer.

The agricultural implements have been placed in a class by themselves this year, and mostly in a large room upon the north side of the pavilion, constructed expressly for their display. Among the California inventions and make are a gang plow, by G. A. Davison & Co.; a side-hill plow, by I. & H.H. Sooville; Brown's challenge plow; Gustafson's tree and shrub-box, and Knott's horse power fastener. All these inventions were patented through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, and they are all worthy of special examination.

Among the gang plows on exhibition, and not enumerated above, are the Sweepstakes, exhibited by Baker & Hamilton, and which has taken several first premiums in this State, and the Tustin Champion plow, an Oregon invention. This is its first public exhibition. Messrs. Treadwell & Co. exhibit Hnie's patent gang plow. There is also the Watson (Portland, Oregon) gang plow and the Murphy plow, exhibited by Morris, Murphy & Co. Messrs. Hawley & Co., exhibit the Moline plows, intended particularly for working among corn at an early stage of its growth. There are quite a number of the common walking plows, a number of which, together with the Moline plow, above mentioned, were received by Hawley & Co, of this city, overland, since the opening of the present exhibition.

Of seed sowers we have also a variety. Mr. L. L. Sawyer exhibits Finlayson's broadcast seed sower, an Oregon invention. Much merit appears to be justly claimed for this sower, and the agent proposes to give a public exhibition of its merits outside of the Pavilion, in a few days, at which competition will be freely invited. Baker & Hamilton also exhibit Floyd's broadcast seed sower—a large one to be operated from a wagon, and another smaller one to be carried upon the shoulders. They also exhibit the Buckeye seed drill, for sowing and covering grain in drills.

Baker & Hamilton make a very extensive and noticeable exhibit. In addition to the articles noticed yesterday, this firm exhibits the Union mower, a machine which has been in use on this coast for the last five years. It is a light and cheap, yet strong and durable machine. It cuts a swarth four feet six inches wide. They also exhibit a 50-saw universal cotton gin, with condenser; also an improved hoisting engine, which they import of various sizes, from five to twenty-horse power. These articles may be seen in the machinery department, near the iron foundry exhibit of Hanscom & Co. They also exhibit in the agricultural room a superior cast steel single plow—a deep tiller, with cutting wheel, two other single plows, a Gall's feed cutter, and a sweepstakes horse fork, manufactured by the San Leandro Sweepstakes Plow Co. This last is a new invention, for which a patent has been applied for.

Treadwell & Co. make a fine exhibit from their large stock of agricultural implements. We notice first one of Hoadley's superior portable engines, greatly improved, and especially adapted for use on this coast. Accompanying this engine, is one of Russell's improved threshers and separators. These two machines, as now exhibited, with their latest improvements and modifications, form one of the best combinations for threshing and separating grain ever presented to the farmer.

Messrs. T. & Co. also exhibit one of Haines' headers, with Doane's patent adjustable reel. An important improvement has been added to this reel, consisting of a simple device for raising and lowering it, so as to enable it to reach grain with different or varying lengths of stalks; and also to be more readily used in windy weather.

This firm also exhibits Kirby's reaper and mower, with combined self-rake and reel. This machine has met with great success, and is suited to all conditions of grain, heavy, light or lodged. The machine can be set to cut any desired height from the ground.

With the aid of the machinery herewith presented, the broad and level fields of California may be harvested so cheaply as to enable the grain growers of this State to compete with those of any other State in the Union, in our Atlantic seaports or any other portion of the world. This firm also exhibits a cotton gin, suggestive of the possibility of a new agricultural industry on this coast. They also exhibit two broadcast seed sowers, one of large size, to be operated from a wagon, and another smaller one to swing from the shoulders and be operated on foot; also three of Hutchinson's cider mills.

J. W. Clark, of Hayward's, Alameda County, exhibits a grain separator and bluestone mixer combined, which was illustrated and fully described in our issue of Sept. 28th last. Messrs. Hunter & Weister also exhibit two grain separators, one intended for work on a farm, and the other for mill work. Mr. Hunter's separator was illustrated and described in our issue of Monday last. J. J. Crowley also shows in operation a separator and bluestone mixer, patented through the M. & S. PRESS AGENCY.

T. S. and T. A. Brown, of Alameda, exhibit a superior field harrow, which has already been illustrated and fully described in our columns. The patent for this invention was obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Mr. A. Williams exhibits two rotary harrows, which are found very serviceable on ground suitable for their use. F. B. Lamb exhibits a vegetable cutter, and E. W. Walton a weed cutter, with an extra blade. There is also an Eagle hay press on exhibition by H. C. Pratt & Co.; a dog power machine by Mr. Hong, of Sonoma County; a cow milker by L. L. Sawyer; trimming shears by E. B. Hendee; and a lawn trimmer, Hill's patent, which will be illustrated in our columns in a few days.

Hawley & Co. exhibit a Buckeye mower and reaper, with self-rake attachment, and another with drop attachment; also Burdick's National hay cutter. The plow exhibit of this firm was noticed yesterday.

D. S. Smith exhibits the model of a Randall rake; also an improvement on the same. This rake has received the highest premiums at most of the agricultural fairs in California and Oregon. Mr. S. explains its principle by the use of models working on a table in the agricultural department, showing how stones, stumps and ditches are no obstacles to its operation. This rake may be seen illustrated in another column of to-day's issue. Last evening he received the model of a sowing attachment, lately patented through the M. & S. PRESS AGENCY, by Mr. George H. Crocker, of Marysville. By this device, the rake can be converted into an effective broad-cast sower in fifteen minutes—a single running gear answering for both. Olpha Bonner, Jr., of this city, exhibits a rake constructed something after the style of the Randall rake; also a grain lifter, which appears to combine many advantages for the description of work in which such implements are employed.

Mr. L. L. Sawyer exhibits Johnson's patent portable fence, a fine invention recently patented through the M. & S. PRESS PATENT AGENCY, and illustrated and fully described in the FAIR PRESS of Sept. 27th. There are two gates on exhibition, one self-opening, exhibited in model by E. P. Hicks, and the other, a traction gate, ingeniously hung and balanced. John Nestor, of Portland, exhibits an apple-paring machine. T. Locher attracts considerable attention with his steam plow model, which he exhibits at the FAIR PRESS stand. We notice other exhibits as follows: A stable with patent feed attachment, by Benj. Harris; an hydraulic wine press, by Hanscom & Co., of the Ætna Foundry; a stake puller, by Richard Knott, of Suisun; and a Rouse's patent step and fruit ladder, exhibited in model by O. M. Sherman, and an improved grape crusher and stem separator, by T. C. Turriugton.

CLASS V.

SECTION 1—NAVAL ARCHITECTURE.

The fact has developed itself during the past year that ship-building is profitable on this coast. Mates and captains who had become familiar with the demands for carriage of peculiar classes of freight, went in

quite a nnmher of cases, to Humholdt Bay, Trinidad, Pugst Sound, etc., and huilt flat-bottomed vessels; which they were ahle to do so economically as to almost or quite pay for the building, hy the first load taken from the north coast to San Francisco. Many large sea-going ships have also heen built, it appears, at a cost much less than is done even now in the Nsw Englnnd yards.

Thus it eeems that our old and well-eetahlished predicate upon the future incapacity of California for ship-huilding and commerce, is proved to be entirely wrong—though founded on the practical judgment of workmen in "hnckmatack," from Maine.

Messrs. Thayer, Camphsll, McKenzie, Housman, and Nicholas, exhibit shipbuilders' models for small craft, in variety snfficient to rewnrd examination hy adepts in the shaping of water lines. Thayer's model of a schooner in laurel is a gem for an artist—without exception the finest thing of the kind that we have ever eeen, being an ordinary but finely-executed schooner model on a hack-grnnd of knotted laurel, presenting such lines of the natural grain as give the effect of a painted landscape, with hills on the left, towards which the schooner is sailing on the straight grain representing water. For a shipbuilder's or yachtsman's cabinet, such a painting of nature's own execution, brought out only by saw and plane, would be incomparable.

Larsen, Milledge, Gadvich and Castro—all old eailors—exhibit full-rigged vessels, made by them in leisure moments, and under circnmstances whose contrast is noteworthy. The steamer Fusi Yama was mnde by Larsen at Hankow—an American river steamer, with a band on board (a Swiss musio box), shooting hy the river front of that Chinese town. We feel that it is moving, and we catch the spirit and excitement of gay excursionists on board, a nnmher of whom staud ataring stiffly at us, yet in this caae, very naturally, being made of wood. Left high and dry at Hankow, waa Larsen; and we are glad of it, for he has reminded ns in this way that just anch aights are a matter of courae 1,000 milee in the interior of the Flowery Kingdom. What South Sea *lau hallow* cottage Milledge was idling or luxuriating in, when he modeled the missionary brig Morning Star, the record shows not; but there are beantiful pictures of tropical shores and valleys, that the Morning Star recalls—to ua, as well as the modeling did to him, for we have voyaged with Capt. James in the Morning Star, and we find the model exceedingly natural in all exoept its slightly too large and ecarcely sufficiently graceful waist.

Castro, a Greek, who has learned to know the aea and loves it, having become a component of the race of Californiane, fetches up at Belmont, Nevada, with several months of leisure on hia hands—long wintry nights, or the mine at a stand-atill. We have as the result of his honest reminiscenoes of the aea, the large model of the sloop-of-war Nevada, ont of "knot pine," (nut pine), made with hia pocket knife. Commend ua to a aailor that will make a model under auoh ciroumstrnoes. He oan spin good yarns.

The hest full-rigged model in the Fair, is that of Peter Gadvich, whioh is an artistio piece of work, made at Coos Bay, Oregon, where our better quality of coal comes from.

Two screw propellers—the labelled one hy J. E. Kennedy—are designs for more easily outtiug and perfect bladea. O. T. Stacy exhibits Richardson'a ateering apparatua with tongent screws, which makes the rudder ohey instantaneoualy, and prevents the throes of the sea from affecting the ateersman. A. Crawford shows aeveral good things—an ingenious gas generating ship's lamp, two of Massey'a patent frictionless aelf-recording logs (on the propeller principle), and a deep-sea lead, also aelf-recording like the above, so long aa the lead is sinking, but provided with a catch, which prevents any change after the lead has once touched bottom. The most perfect deep-sea lead invented is probably that whereby the degrees of compression are measured and recorded, the instrument being cast away like a bottle, to be afterwards picked up hy others—a practical drawback.

Capt. Wakeman's hoat-detaching apparatus, ahown with a large model of a row hoat, has the merit of great strength, being fastened on tho stem and stern poets. A metallic life-boat, hy L. D. Herrick, called the "Lady Gay," is unwreckable, but is not very nicely made, and embodies nothing new in principle.

To finish up with a glance at the things in this department, the visitor should go into the Art Gallery and refresh his rocollections of the sea hy looking at Denny's Golden Gate from Goat Island (sold for $1,000); also his heach scene near ths Cliff House, and his Breakers on the Bar and Bonita Light-house; Wilson's Storm and Fire; Walker's Helmot Rock, and Sunset on the Coast.

SEC. 2—MILITARY ENGINEERING, ETC.

"*Horrida bella,*" with its chief agent callod villainous saltpeter, and the newly-invented explosivss still more villainous, occnpies a full section in the official catalogue; overehadowing the peaoeful art of blasting, as well as the industry of making the phosphor matches wherewith to light the candlo to go to bed. Pyroteohnics excite in the youthful hrain the passion of destructiveness; therefore belong to military science. We make war upon the quails, who are too aminble to retaliate, even if they could, and upon deer, and Indians where they abound; also upon the ribs and bowels of the earth, which we would tear to pieces till there is nothing left to stand upon, in search of gold, or cven silver, and lighter trssh.

A. F. Potter's smooth-hore cannon and fan-winged projectile is the most noteworthy article in this department. It is something new, and is a highly important invention, if, as appears to be well made ont, the effect of rifling is ohtained without the expenso and retarding influence of internal grooves spirally wound for the ball to follow. Mr. Potter makes the ball do its own rifling in the air. The eame revolving motion, attended with the highest possible accuracy, is attained by means of an attachment to the ball oonsisting of several twisted planes, like those of a propeller, or patent log. From the committee which will take this matter in charge, we hope to obtain some well-made comparative tests to show the value of this invention, which we are told prove everything that could he desired of it in prnctice. Potter's projectile will do not only for cannons, but for amall arms, and especially for shot-guns and revolvers; enabling us to use bullets effectually with the former, and ahot, if we desire to do ao, to catch hirds with the latter. The ehot-gun becomes the most usefnl, serviceable, and the most formidable of weapons. The revolver can he applied with fine sights, and a shonlder-rest, for distant objeots, and used as accnrately as cannonading in proportion to the distance it carries; or it can be used for olose qnarters, and for scattering execution. The small cannon of Mr. Potter is a pntent breech-loader, of very excellent design and workmanship.

Guns, pistols and fishing tackle (hooking and netting are strntegical) are exhibited in splendid cases, showing all the late anhstantial improvements for the rapid use of fire-arms, by Liddle & Kaeding, A. J. Plate and Wm. Rudolph. These cases are worth atudying. Mr. Plate showa, besides shotgnns, Henry rifles, and Tranter & Colt's pistols, one large heavy rifle for great distances, such as Berdnn recommends with the telescope eight. Liddle & Kaeding show a grent variety of new and patented gun inventions, ehotguns without cocks, needle guns, Henry rifles, miniature pistols, etc. Mr. Rudolph shows some fine ahotgnns and his patent lock, which occupies an exceedingly emall space, and has other excellencies already illnstrated and described in this paper. This lock has also been patented in foreign countries by the M. & S. Press Agency.

Cranmer's machine gun, a revolving hattery having three rifle barrels loaded at the breach hy means of an iron cylinder, is a noteworthy invention, and though looking aomewhat complicated to a passer-hy who has not the henefit of an explanation, is as aimple as a common gnn, and in each individnal harrel as effective. The gun will work; will not heat, because at the heating portion of the barrels there is a tank of water that coola them off. When the holes in the cylinder to hold the charge are turned upwards, the loose powder from the powder reservoir falls in, the ball next following, automatically; a rammer then entere, and the next instant the charge is fired off—not in one harrel alone, but in three, or three dozen aimultaneously, or as many as the warrior may desire. The capping is precisely the aame as in an ordinary gun, but is done automatically. Tho Cranmer gun fires 100 volleys per minute, and is eqnal to 100 men, or more, for it shoots with the accuracy of a gun in a vise, and mows down everything before it. In warfare it must come into use, like the Gatling gun, as a defence against cavalry, and against storming parties in hatteries. It has many advantages over the Gatling gnn, as well as over the French slide-plate hreech-loading machine gun.

Saltpster holds its own, as yet, to a degree scarcely perceptihly reduced, while nitro-glycerine, giant powder, gun cotton, and the Hafenegger powder "keep it before the people" that blasting could be done more cheaply by the employment of either of these agencies. The Giant Powder Company put forth the results of the Prussian military engineer corps, pronouncing giant powder as supsrior to gun cotton or hlock powder for pallisades and other wooden obstructions. This powder has already been introdnoed in a measure. Neither gun cotton nor the Hafenegger are actively pnshed at present in this State. But the powder question is one that need not he decided in a day. As the discovery and use of common powder revolutionized the world, though not in a day, so the "coming" blasting agent promises, with the additional application of machine drille, to work a mighty revolution in the facilities for obtaining, out of the hard rocks, the precious and useful metals—in perhaps an increased ratio of plentitude, yet which remains constant in proportion to the advance of the arts and civilization.

The Hafenegger Powder Company exhibit at the Fair two hottles of their blasting powder No. 2, a gray substance resemhling giant powder, the one of a darker hue, which are as safs as wood for transportation until mixed, when they are on a par with common powder as to ignition; but unlike giant powder, are insensible to percussion. A lurking donht in the minds of many as to eafety—easily fostered and kept up hy a heralding of the well known unmanageahility of chloride of potash in the laboratory—has operatsd disadvantageously to the speedy introduction of the Hafenegger powder; hut it would be a real loss to the miner if so powerful and so very cheap an agent as the Hafenegger powder should have to be abandoned on that ground alone. Allowing something for prejudice, it is possible that we may aoon hear more about the Hafenegger powder in the mines. Its extraordinary power is well exemplified in the Fair hy the exhibition of a mass of native copper that was torn open, and of four ⅜-inch iron plates riveted together, that were pierced by the downward force of an explosion.

Matchea are exhibited by A Colsh, of the Paoific Match Factory, where the rounded kind are made and finished into common matches and fusces of superior quality.

The California Powder worka exhibit a fine array of kegs, and samples of blasting, sporting and cannon power.

Church & Clark'e fire works have merits that are better known in California by witness of actual trial, than we can make apparent by a mere desoription of the extraordinary things that are displayed on the southern wall of the Pavilion.

An Earthquake Indicator.

A great deal of fun was created in the Fnir recently, by some wag pinning a label "Earthquake Indicator, Donahne's patent," on the curions apparatus among the achool fixtures, for illustrating the solnr system. This very ingenioua instrument consists of a central sun, about the size of a mnn's head, around which are fixed, on wire, leaser apheros, to represent the moon, earth, Venus, Jupiter, and the other planets which comprise our eolar system. By turning a handle, each of the planets make the revolutions peculiar to it, and the calculations being correct, the instrnment forms a very clear illustration of the movements of the planets and their relations to the earth. But lnst night, a youth with downy mustache, who has been atudying the arts of "gah" in a well known debating clnb, undertook to explain the theory of earthqnakes with this machine. The way he dilated and expatiated on the subject, the hard words he used, which are, and which are not in the dictionary, was excruciatingly amusing to those who were in the secret; but the crowd took it all in as gospel truth, and thought the young scamp was better posted on earthquake matters than either Caxton or Stewart. But after a while the secret leaked out, when the fun hecame furious; and what is still very remarkable, nohody knew anybody who listened so intently to the remarkable lecture on eartl-quakes. The clerks of tho Fair don't know who Donahue the patentee of the Earthquake Indicator is.

The difference hetween men and dogs is, that the latter lovee his friend hetter than himself—the former don't.

Water Assessments and Water Meters.

As there is a water meter in the Fnir, and as the Pacific Coast promises to do something towards eolving this extremely difficult, yet at the same time extremely simple prohlsm, the following summary of Dr. A. W. Hall's paper on the subjsct, from our New York engineering correspondent, will he found to contain interesting information.

Ever since water was first conveyed to cities by artfficial means, thns making it the product of lahor and capiial, and an article of commerce and exchange, the same as gas and flour, there has been a growing demand for a chesp and accurate water meter. One hundred and thirty American patents have been grantsd for water meters.

The adoption of a system of water meters in a city, would be in the interest of the poor, becauss now every house owner has to pay a water tsx, a proportion of which every man who occupies a floor, is oompelled to pay to the landlord—and this tax is apportioned by gness instead of measurement. No matter how oareful he may he not to waste water, he still has to pay his proportion of which his neighhors waste; while this very waste keeps the reservoirs so low that tho second and third floors cannot ohtain water at all.

The amonnt of water that runs throngh the Croton Aqneduct daily, equals ahout sixty gallons per diem to each inhahitant during the rainy aeason, and thirty or forty gallons in the summer months.

All the wnter meters that have come to light, may he classified under five heads, namely: Piston meters, rotary meters, screw meters, diaphragm meters and dumping meters. About 1,000 piston meters are in use in New York, hnt their cost is so great as to preclude their use in dwellings or stores, none but large manufacturing houses and hotels and distillerica, and other estnblishments required to pay high water rates, heing willing to incur the expense. The eheapest one-inch pipe meter (suitable for dwelling houses) yet offered, costs $35 each, and what is considered the standard meter of the country, costs $70 per meter of same capacity. These high prioes and tho complication of the machine with varioua mechanical defects etill leayee the field open for the "coming meter."

In conclnding, Dr. Hall exhibited a meter of his own construction, being what is called a "proportionate meter," that is, one that divideathe water, and measures a small proportion of it to indicnte the whole amount used. The cost of this meter, one-inch pipo, wonld not exceed $5, and a four-inch pipe meter $8. The standard 4-inch meter used in factories, etc., costs $6.50. He also exhibited a modification, the cost of which will not be more than $2.

The Hicks meter is a double piston meter, in which valves, other than those afforded by the pistons themselves, are dispensed with. The Hawley meter, in which an ingenions, and it is claimed, extremely durable form of diaphragm, is used, and the Cochrane meter on the dumping principle, with air valve attached, to nerate the water and preveut a vacnum in the bucket chest; all these were exhibited and explained by their respective inventors.

The I. C. U. Club.—The memhers of this clnb are of both sexes, a great many of whom may he seen at the Fair every night. They are easily recognized; the males by the exquisite curl and gloss of the hair, and the femalee by their airs. The leading memher of the male branch is well and favorahly known at a famoua restanrant on Clay street, where his stentorian commands for "Roast heef rare," "New York plum," and "Indian," have long impressed the patrons of the establishment he gracea with the idea that he is no common man. The leader of the female branch of the I. C. U. Club, acquired her taste for dress—which she exhibits nightly to the admiring gaze of the multitudo—at a famons millinery and dress-making estahlishment on Third stroet. Both these leaders are magnificent specimens of the I. C. U. Club.

Sheeat, a citizen of Alabama, has been appointed Consul to Elsinoro. "Sheets has gone to Hell Señor," is the way an English friend of ours reported it to Don Pio Pico.

A. G. Waterhouse's Mechanical Movement.

There are a couple of small models on exhibition at the Fair, which deserve more than a cursory examinatinn. They represent the head of a ship's rudder, with a novel steering apparatus, and a common windlass-barrel and crank. The psculiarity in both is ths novel and remarkably effsctivs application of ths lever in imparting a rotary motion, which increases the motivs power several hundred fold; a child being able to raise ssveral tons without great effort. Ths principle upon which this valuable discovery is based, is ths use of an eccentrio wheel fixed to the shaft of the crank or lever. The eccentric revolves within a donble circle, cogged within the inner periphery. Ths cogs being a multiple of the circumference of ths eccentric, so that it reqnires soveral revolutions of the latter to make one of the former. Each circuit made by the eccentrio moving ths inner circle ons cog on the onter. By this simplo process thsro is scarcely any limit to the power that may bs generated by a vsry small apparatus. The principle involved, which is quite new, and recently patented, is adspted for any purpose in which a cog wheel is reqnirsd to increase power, whether it bo a watch, a windlass, or ths most powsrfnl crane. The models explaining the new movement ars placed near Fnlda's wine eask, and should be examined by every mcchanic. Engravings aro neccssary to fully illustrate the movsment.

Polytechnic Evening School.

Mr. F. Hsllert's evening schsol for instruction in the advanced steps of industrial mechanics, has received merited rscognition from ths Committee on Evening Schools of the Bosrd of Education, and is very creditibly to the educational depsrtment, which, now a part of our public school system. Mr. Hellert's idea was to impart orally to young men of mechanical ambitions, and to laboring tradesmen, who wsrs desirons of becoming masters in their specisl business, such instruction as would be of the greatest immedists servioe to them. Drawing and geomstry occupy much of thc tims at this school, but the principles of mechanics, undsrlying and applying to every trade, are entered into with a visw to the students requirements. It is impossible to speak too highly of schools of this kind, provided they be so snstained and carried on, as to bs of resl advantage to students, young or old—but to the mentally neglected especially—who wish to become thorough in any special thing; for Americsns are too apt to be superficial, and too lenient of humbuggery outright. Ths teacher should be thoroughly posted and abls to give information ss to the best books or other publicstions upon techuological snbjects, and should rathsr give things of ths workshop than of tbe books. Apprentices, and all young men who ought to bs apprenticss (including everybody) need assistancs of this kind, and the best that can bs affordsd by ths efforts of a liberal Bosrd of Education and Mschsnics' Instituts combined.

Ths hours for instruction are from 7 to 9 P. M. every evening, except Ssturday, at Lincoln School. We understand that there are now forty pupils in Mr. Hellert's hauds.

ENTERPRISE.—Strahls & Hnghes, who have added such an attractive fsature to the Fair, by their California Laurel Wood Palace, intend to make some important additions to that institution, and take it to the Atlantic Ststes and Europe, to illustrate the beauties of California hard woods. This palace has cost these gentlemen upwards of $5,000, and thsy intend to expend $10,000 mors to exteud the employment of onr nstive woods for ornamentsl purposes. The list of thcse woods is not confined to the laurel, but includes maple and birch of several kinds, rosewood, bird's-eye red wood, and several others.

LOCKE & MONTAGUE.—Ths name of this firm has been so long connected witb the stove and metal houssbold ware trade of this city, that one seems to be permanently associated with the other. They are heavy importers aod keep an extensive variety of first quality goods, and can satisfactorily supply the wants of all customers at the most reasonable rates.

Weekly Shareholders' Directory, for Meetings, Assessments and, Dividends.

(Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.)

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Oct. 8, 1869.

We give ths following as an approximate price at which coppsr ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent.:

	Per ton.			Per ton
12 per cent. ore	$24 00	18 per cent. ore		$41 40
13 " "	26 65	19 " "		44 65
14 " "	29 40	20 " "		48 00
15 " "	32 25	25 " "		62 50
16 " "	35 20	30 " "		75 60
17 " "	38 25			

Ores ssaying above 30 per csnt., $2.50 psr unit. Bars at the rate of 13c. per lb. for pure coppsr.

Thess prices, corrected by W. T. Atwood, we believe will be found substantially correct, and can be realizcd at this date.

OCCIDENTAL INSURANCE COMPANY.—It is but a few years since the first bome insurance company was chartered in San Francisco, and now we have a dozen or more—showing the disposition of our people to patronize local enterprise. Among the institntions of this kind which have met with signal succcss, and grown into importance with the growth of our city, is the Occidental Insursns Company. This organization commands the fullest confidence, and is taking a large share of first class patronsge in both fire and mariue insurance.

WINDMILLS.—W. I. Tustin, manufactures at the corner of Market and Ssventh streets, a self-regulatiog and perfsct adjusting windmill that cannot be beat for strength, durability and simplicity. It took the first premium at the former exhibition. We advise those interested in the article to examine his first class mills just as he makes them for actnal service at his shop.

RETURNED.—Dr. J. H. Peine, Dentist, Wedsworth House No. 228 Sush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, or Enameled Cards, of the very hest quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warrauied to give satisfaction.
10v18 6m S. F. HOWLAND.

DR. HALL has just returned from Europe after an absence of one year, during which time he has visited England, Ireland, France and Germsny, and has held consultations with the following eminent physicians: Drs. Carling Druit, Lee, Parker, Acton, Aitkea, Churchill, Ricord, Velpeau, Boech, Sperino, and Hewitz Many of the cases in which he held consultation with the above named eminent physicians were, we are sorry te ssy, those of Americans. Americens will not now be under the necessity of leeving the Pacific Coast for Medical Treatment, for Dr. HALL has brought with him every new mode of treatment known to the greatest physicians of the world. To old residents of the Pacific Coast it is needless to mention the address; to new comers, however, it is necessary to mention that he may be found at the American Surgery and Dispensary, 402 Montgomery street, opposite Wells, Fargo & Co's, San Francisco 21v18-3m

Use Pain Killer for Cholera and Bowel Complaints, for Scalds, Cuts, Bruises and Scalds, Old Sores, Sprains, Swelling of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Frosted Feet, Felons, Sore Throat, Sun burn, Colds, Coughs, Etc.

Use it for any of these, and you will never do without it. Its success as a veluable family medicine has induced others to imitate and counterfeit the Pain Killer to some extent. *Beware of Counterfeits!*

A Family Medicine.—The PAIN KILLER is a purely vegetable compound, and while it is a most efficient remedy for pain, it is a perfectly safe medicine, even in the most unskillful hands. For Summer Complaints, or any other form of bowel disease in children or adults, it is an almost certain cure, and has, without doubt, been more successful in curing the various kinds of Cholera than any other known remedy, or the most skillful physician. In India, Africa and China, where this dreadful disease is more or less prevalent, the Pain Killer is considered by the natives, as well as European residents in those climates, a sure cure.

We have long known the high character of the PAIN KILLER, and that it is used with great success and satisfaction in our best families. It is the favorite medicine of our missionaries in heathen lands, where they use it more than all else together for the diseases that abound in those warm climates. It should be kept in every house, in readiness for sudden attacks of sickness.—*Chr. Press.*

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

REDINGTON & CO., and HOSTETTER & SMITH, San Francisco, Cal., General Wholesale Agents

New Advertisements.

WANTED.

Two Experienced Copper Smelters,

Capable of taking charge of BLAST FURNACES. Those who have worked in Copperopolis or Swansea will be preferred. Apply by letter, with references, and stating wages expected, to

W. T. RICKARD,
Cosmopolitan Hotal,
15v19-2w-n1 San Francisco.

J. ROSS BROWNE

No. 91 Montgomery Block, San Francisco.

Will examine and Report upon AGRICULTURAL LANDS, RANCHES and MINING PROPERTIES, situated in any of the States or Territories west of the Rocky Mountains.

MR. BROWNE intends to devote the autumn and winter months to a personal examination of such properties as may be offered, and proposes to go East with them early in the spring.

His principal aim will be to encourage IMMIGRATION TO THE PACIFIC SLOPE, and to promote the investment of EASTERN CAPITAL in all legitimate enterprises that may be committed to his charge.

Surveys, Maps and Diagrams of Ranches, Mines and other Properties,

Will be made, if required, by HOFFMAN BROTHERS, Civil Engineers, No. 83 Montgomery Block.

Apply in person or by letter to J. ROSS BROWNE.
13v19-2m No. 91, third floor, Montgomery Block.

Woodworth Planers,

PLANERS AND MATCHERS,

With patent expansion, feed gear and other improvements, made at Worcester, Mass., in the most finished and substantial manner; also every description of Richardson, Merlam & Co's, Smith's and Wood's celebrated

Wood Working Machinery.

Embracing Mortising, Sash and Moulding, Smith's Stickers, Slat and Door Tenoning, Boring, Shaping, Scroll Sawing, Planing, Rod and Dowell making and Re-sawing Machines, Wood and Engine Lathes, etc., for sale at Eastern prices, at the Machinery Depot of

BERRY & PLACE,
112 and 114 California st., San Francisco.

☞Agents for Blake's Patent Steam Pump, (warranted the best in the market); Davis & Furber's Woolen Machinery, etc. Being the selling agents for most first class Eastern builders, millmen and others in want of Machinery can save money by giving us a call. Illustrated Catalogues sent free.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Tarshish.—*Miner*, Sept. 25: Two gangs of men are to he set at work throngh the winter; one taking out ore from the upper work, and the other running the lower tunnel.

M. C. M. Co.—The ore in No. 3 tunnel is deily improving both in qnelity and quentity. Progress this week satisfactory.

The Glohe tunnel is still in ledge matter, and making good headway. No novel indicetions, but symptoms encoureging.

Leviathan.—We saw some samples of very rich copper ore which was taken from this mine this week. Globules of bright native copper stood out all over it. We learn that the body of ore is raising so as to show a large quantity easy of extraction.

AMADOR COUNTY.

Kennedy.—*Ledger*, Oct. 2d: We lesrn that during the past ten days very rich rock has heen struck in the mine.

CALAVERAS COUNTY.

Mining Items.—*Chronicle*, Oct. 2d: The Union shaft, on Stockton Hill, promises richly.....Brackett & Co. are opening ground for extended operations....The Palomo ie turning out coerss gold....Alexander & Co. have their new hoisting works ahout reedy. They will be run by a centrifngal wheel, the water to be taken from the same pipe that snpplies their quartz mill.

Railroad.—Chepman, Hopper & Chapman heve their steem hoisting works nearly reedy, end we mey soon look for large returns, as the average rock worked has been $50 per ton. The Petticoat, Eherhardt & Co., Lewis & Co. and Nimtuck, are all in good rock, and employing a large nnmber of hands.

French Hill.—Some parties have found the extension of the old channel. This secures them their pile, as the diggings in this hill in early days were among the richest in the Stete, $94,000 having been made out of a claim twenty feet squere.

EL DORADO COUNTY.

Dry.—Plecerville *Democrat*, Oct. 2d: At Kelsey, Spanish Flat, Georgetown, and in fect the entire ridge between the South and Middle Forks of the Americen river, there is uo water for mining purposes. There are a few places where men are doing well; among them Jones Hill and Georgia Slide, a few miles northeast from Georgetown, are the most noted. Good paying cleims have been opsned in what was formerly known as Castle Hill, and we expect to hear good reports from that vicinity eo soon as the rains come and water can be had. Ten thonsend inches of water could be sold deily in this section if it could be hed; and it can be hed at least nine months in the year if capital could be secured to constrnct a ditch. There is uo investment in the State that would pay better then a ditch on this ridge. The water is there, and only waiting for an opportunity to run down this way. The mining ground is here, and only waiting water.

Marshall & Co's Tunnel.—On Monday we visited the above tunnel, near Kelsey. It is now in 200 feet. In running that distence they have passed through first rate indications for a paying mine.

Oregon Hill.—Several years ago, Jones & Co. reelized $50,000 from their cleims on the above hill. There has not been much work done on it since until about six weeks ago, when Shepherd & Co. commenced getting out some very rock. It appears to be detected howlders, from the size of a peck measure to severel tone in weight. Some of it, of a porous oheracter, ie very rich, yielding as high as $1 per pound of rock. The whole will yield an average of $30 or $35 per ton. The company is running two tunnele to strike the lead lower down. The upper one is to the load, which is about 2½ feet iu thickness, and prospects well. The company had about eight tons of rock crushed a few weeks since at the Pacific mill, which realized $240. This was from neer the surface.

Taylor Mine.—This mine, two miles from Georgetown, bids fair to become one of the best paying in the conuty. The company are making extensive repairs and enlerging their mill.

Nugget. — Auburn *Stars and Stripes*, Sept. 30: Rev. N. R. Peok informs us that a Mr. Woods recently found a nugget of pure gold, worth $100, in his claim near Georgetown. It was from a seam claim of decomposed quartz.

NEVADA COUNTY.

Good Clean Up.—Grass Valley *Union*, Sept. 29th: The Ideho mine yesterday sent in to Findley's bank, gold to the value of $12,000, the proceeds of two weeks run.

Dromedary Mine.—Grass Valley *Union*, Oct. 3d; The Dromedery hed a clean-up on Seturdey. The yield of twenty-five tons of rock wes about $1000. The compeny working under leese, say the ledge is looking well es they go down. The mine is worked more with a view to develop it then to meke money, at present. It is paying expenses, however.

Moore's Flat.—*Transcript*, Oct. 3d; The Eagle Mining Co. are at work and expected yesterdey to discharge a forty keg hlest in their henk.

Steep Hollow.—*Gazette*, Oct. 1st; We were shown yesterday a nugget weighing ten ounces, and velued at $180, from the gravel cleim of Wells & Co.

Union Hill.—Grass Valley *Union*, Oct. 5th: This mine continues paying a handsome profit over working expenses. The yield for September was $10,500.

The Pittsburg Mine.—*Transcript*, 5th: A week ago, in the 320-foot level, the ledge was strnck one foot thick and exceedingly rich. Yesterday, every piece of rock taken out wes filled with rich sulphurets and free gold scettered through it. The rock breaker, which has been out of order, is now repaired, and the mill will start today, and keep running night and day.

Meadow Lake.—James Jeffrey, recently from Excelsior, informs us thst Churchill & Dolan have made satisfactory tests of the nsw process. They havs been working the Monitor mill, which has five stamps end is run by water power. They roast the rock in a squere furnace, after which it is discherged into a tank, where it is subjected to the action of a solution the composition of which is known only to the proprictor of the process. It is thsn crushed hy ordinary mill process, end most of the gold is saved in the battery. The expense is $8 per ton. The tailings fail to show the color. The Mohawk & Montreal Company are to put up three of these furnaces, capable of roasting 20 or 25 tons at a charge. The Celifornia mill commenced on 200 tons of rock from the Excelsior mine on Thursday, which will he worked by the H. H. Hartley process—the rock to be first crushed and then chemicals applied. Hartley cleims that his process can be applied et 25 cents per ton. The Live Oak Compeny is to have 20 tons of rock crushed from the Pine Tree ledge, and the Wisconsin 10 tons treated hy the Chnrchill & Dolan process. Mr. Nolin is taking out fine looking rock, and will soon heve a orushing. The Ophir Company's ledge peid from the croppings. The compiny now has a seven-foot ledge, every foot of which peys.

PLACER COUNTY.

Rising Sun.—Nevade *Gazette*, 5th: We rceeived a note yesterday from one of the owners in the Rising Sun mine, neer Colfax, who informs us that the prospects are flettering. A crushing of 18 tous of rock, from the lower level, just opened, yielded $1,431.

PLUMAS COUNTY.

Quartz.—*National*, Sept. 25th: The Psnnsylvenia mill, which has heen idle for some months, commenced crnshing rock from a new ledge, near the Indian Valley Co's mine, on Tuesday. The New York mill, now owned hy Mr. Traugh, will commence crushing egain on Monday. The Crescent mill is undergoing repairs. The Caledonie hss chenged owners. Judkins & Kellogg's mill is making averege returns. Bachellor is crnshing quartz from the Green Mountain ledge, and ie getting good pay. We heer thet the Memmoth mill at Jamison has again commenced crushing.

Sold.—The Caledonie quartz mine and mills, near Ronnd Valley, has hcen sold to Mr. Lovell White, of San Francisco, for the sum of $10,000, and other valuable considerations.

SAN DIEGO COUNTY.

New Mines in the Coast Range.—The S. F. *Bulletin* eays: Reports are pnblished of the discovery of plecer diggings and gold quartz in the coast renge near San Diego end San Bernardino, respectively. The "prospects" are said to be very favorable for wagee for a limited nnmber of people, and there is no reasou to expect more than this. As early as 1842 a lot of 20 ounces of gold was forwarded to the Philadelphia Mint from the plecers of San Francisqnito, ahout 35 miles northwest from Los Angeles. These diggings were worked until 1846, yielding $6,000 or $8,000 a year to the labor of a few Mexicens. In 1848, before the discovery of gold in the Sierra Neveda, several other finds of gold and silver were reported, some of which were located near Oakland and San Josć.

YUBA COUNTY.

The Pennsylvania Mine.—*Appeal*, Sept. 29th: We understand that the Pennsylvenia mine at Brown's Valley, hes discontinued work till next epring, in consequence of demages received to its machinery, emounting to severel thousend dollars.

In reference to the mine nemed above, the same journel of Oct. 2d, says: A correspondent writes as follows: "To discontinue at once and without notice to the shareholders, all work at e quartz mine, hoist up pumps and pipes, and ellow the mine to fill with water, is a matter of too greet importance to the shareholders not to make it desirahle for them to be informed of the real motives which heve determined the Board. The mine, for the last few weeks, has furnished enough good quertz to rnn in day time the 16 stamps, and it was generally understood that the claim was sufficiently dsveloped to supply the stemps day and night. There is a substentiel ledge of rich quartz in levels nine and ten, and there is also a fine ledge at the hottom of the shaft. In short, it is said, that with a different set of miners, at a monthly expense of $3,500, the mine could be made to yield, from this very day, at least $10,000 per month, and it is also asserted, that a dozen men could be found, who would swear to this. It is hoped that Americans will soon find it necessary to prove that they are still masters on their owu soil."

Arizona.

England Gulch.—*Miner*, Sept. 18th: We were shown this week by William Kelley, $37.45 in cosrse gold, the proceeds of 240 huckets of dirt taksn from the old England Gulch by two men. Last week the same two men rocksd out the sum of $70.

Big Bug District.—Mining property helonging to the estate of the late Robert Smith, sold by auction Saturday, brought good prices. L. W. Worth hought ths Bellhaven, Manhattan and Weehawken claims. Jessie Jackson, the Wide West, and N. Lacoke, the Badger. The ditch property was bid in by A. Burroughs.

Quartz.—The quartz miners of Walker's and Walnut Grove districts are seid to be taking out very rich ore....Work upon the Sterling mine has been suspended, for what reason wo do not know....At last accounts, hoth mills at Wicksnburg were running.

Colorado.

Summit County.—Central City *Herald*, Sept. 18th: Thos. McGowen, recently from Summit, reports gulch mining successful dnring the season. He will return in ths spring. He has diggings thsre from which hs expects an ounce a day. Donnelly & O. Donnel heve several lodes which have asseyed hig. Bnt little has been done yet in quartz mining. Rich lodes have been discovered, hut capital has not yet been invested to develop them. Mr. W. Ripping is putting up rsduction works at Lincoln City, in Frenoh Gulch.

Coaley Mine.—*Register*, Sept. 25th: Mr. Eugene Teats gave us a tablespoonful of ore the other day, from the Coeley. On being melted, it gave something over two ounces of silver. The assay returnsd $26,395,80, coin value, per ton.

Items.—Collom's smelting works, at St. John's, will he ready to run in two weeks.....Ore from the depth of 120 ft., assayed the other day $900 per ton....N. W. Robinson, from Burlington, Vt., is going to drive an 800-ft. hole for the Bullion-Incas Co. with the diamond drill....We saw 6¼ ozs. of gold worth $140, which was washed from three pans and a quart of decomposed ore from the German lode, owned by L. A. Klein....Consolidated Gregory is raising quantities of fine looking smelting ore, The stamp rock holds about as nsual....Pay in the hottom of Pleasant sheft is eight feet wide, and the ore runs about eeven onnces per cord....Judge Ginn and partners are down 15 ft. in the Bntler lode on Gunnell Hill, and have a wide vein of rich looking ore. A uew lode 200 ft. above, is turning out rich.

Idaho.

Boice County.—*Statesman*, Sept. 28th: A new quartz enterprise is in progress neer Pioneer. Mr. I. T. Stohbard yesterday presented us with epecimens of rich ore from the Dnncan and Justicia ledges. He hes just returned from building calcining furnaces and a cupel. He informs us that the Superintendent of the works ie an experienced emelter from Swansea. The results of the undertaking will he known in a few days, and if successful there will he from twenty to thirty cupels in full hlast during the ensuiug summer. Mr. S. says there are at least ten thousand tons of ore in sight which assays from $179 to $2,400 per ton.

Alturas County.—Rocky Ber correspondence of seme; Little more quartz mining will be done here this fell; nearly ell the miners having left for the nsw mines in the north. At Red River, Mr. McNelly, of the Cosco compeny will kesp his mill mining ell winter. At Yuha, E. C. Atkins is working the Atlanta with his usual success on *third class* ore most of the time. Wm. Clemens is rnnning his arastra on "Minerve," and "Varieties" ore, and meking money in his quiet way. By the way it is reported thst Dr. Bishop has organized a compeny in London on this "Minerva" with a capital of $100,000, cash all paid np, to commence work early next spring. If this be true, I congratulate our English friends on having a mine that will pay dividsnds from the start.

Owyhee.—*Wave*, Sept. 30th; The Ida Elmore hes adopted the contract system for sinking and stoping. The lower level is represented by the miners to be the richest point yet found in the mine, and ore more abundant.....The sale of the persoual property of the Oro Fino Company, on Setnrdey last, took place according to announcement, and everything went at ruinously low prices....Another contract for stoping has becn let in the Golden Chariot mine at $68 per fathom, to Keif & Co., hsing $2 less than the contract of two weeks ego. The chief object at this time, was to clesr the way for a winze south of the main shaft and ahove the seoond level.

Long Gulch.—Messrs. Sayre and Firehengh have struck en extension of the ledge below the Monntaineer Co's tunnel, on the north side of the gulch, which is represented as extremely rich. We have conversed with parties who estimate the vein at two fest, and that it contains $200 rock.

Loon Creek.—A correspondsnt of the *Wave* writes from Idaho City, Sept. 21st; "I left Oro Grande on Monday; there are twenty or more claims now running, and all paying. Some large piecee are being taken out occasionally, ranging from $9 to $130. I brought in ths $130 piece this trip. It came out of Chepin & Co's claim, No.9, ahove the discovery."

Another writes from Oro Grsnde, Sept. 25th: "The minss, so far as prospected, ers only in the creek. For four miles the creek has been sufficiently worked to settle the fact thet it will richly pay. The gold is coarse, from five cents to five dollars. One nugget weighing *seven ounces and a half*, was found in Foster's cleim in the grevel two feet from the bed rock. The gold down the creek becomes finer. The great troublo is, the diggings ere very deep and heavy. This has prevented a thorough prospect of the camp, as the men were afraid that they would be unahle to *prove* their gronnd before snow, end they would be forced to winter hsre, without means to buy provisions. Another season will show that this is one of the richest camps yet struck, elthough its extent may not hs so great as many anticipeted. There will be room for 1,500 or 2,000 men. Old Nate Smith returned ou Thnrsday from a prospecting tour and reported having struck new diggings. Immediately the town wes alive with men and every one was excited. Yesterday 300 or 400 men started for "Yellow Jackst Creek." Smith believes it will hc a sscond Boise Basin.

Loon Creek Dust.—Another item in the seme journal is as follows: Some of the newspapers are unconvinced yet as to the Loon Creek Minss. Such should have seen the dust brought into the *Statesman* office ycsterday, hy Dr. Betts, recently from there. It is the finest lot of dust in appeerance and quality ever found north of California, except perhaps that from Kootenai. One elug weighed over two ounces, and there were many of three and five dollars. The Doctor eaid he had eeen one weighing $135.

Loon Creek Mines.—*Avalanche* Sept. 25th: From all we cen gather relative to these mines, we infer that they fall short of early expectations. The mining territory seeme to be limited, and it is improhable thet gold exists to any extent outside of the districts already prospected, which embrace a narrow strip of the flets and creek bed, for two or three miles. Bnt there would seem to be no question that some of those claime are very rich.

The *New North West*, Deer Lodge, Montana, Sept. 24th, has the following: On Sunday, John Baker end several others returned from the Loon Creek mines. They report the number of claims limited, and hut few opened. Claims that were held at $1,500 on their arrival, were afterwards sold as low as $100. Provisions wore scarce and high, and a great number were leaving the mincs disappointed.

Montana.

THE LITTLE PAYMASTER LODE.—Helena *Gazette*, Sept. 23d: Messrs. Vivion & Cooper have sunk three shafts respectively, 65, 50 and 40 feet deep, besides several less shafts, all combined, exposing over 1,000 feet of the ledge. The vein has a width of from two to five feet. About one year ago, 50 tons were hauled to the L. X. L. mill of J. C. Ricker, which yielded $1,200, or $25 to the ton; a few months later, 80 tons were crushed in the Greenhorn mill, near the lode—ten stamps—which yielded $12 per ton; last Saturday, a clean up from the same mill of 25 tons, returned $30 to the ton, currency. We weighed the retort from this last run and it comes fully up to the figure given. The proprietors design putting up machinery on the ground. There is a splendid site for a large mill within 400 feet of the discovery shaft.

SNOW SHOE GULCH.—The Williams & Parnell Co. are taking out from $7 to $8 per day to the hand. They have plenty of water, which, it is expected, will last all the season. There are acres of ground as yet untouched.

HIGHLAND GULCH.—Cor. of *New North-West*, Sept. 24th: The Highland Gold Co. purchased a quantity of silver ore from Day, Harvey & Co., Moose Creek, for $3,500, on which the mill is running. The lode from which this ore was taken, is known to be one of the richest in the Territory. Wash Stapleton, of Argenta, bought 10 tons, for which he paid $100 per ton on the ground, and which he freighted to Argenta to be worked. It is probable there will be machinery put up next spring.

The Only Chance quartzes are running with gratifying results. A sale was recently effected; Flowers, Hines & Crisp purchasing Nevins & Farr's interest.

Johnny Kahn & Co. discovered a short time ago a new streak in the main gulch, from which they are taking from $400 to $800 to a set of timbers.

Nevada.

COPE DISTRICT.—The White Pine *News* of Oct. 2d, says: We have had eight of a man from Cope. He says there is one good claim there, and Atchison and Drew will do well with their mill. The Placer diggings are not properly diggings at all—it has not been demonstrated that any money can be made though 'colors' are found. In Elko he met a large force returned from Cope, all ready to part with fine fortunes in that district. He says Cope may turn out gradually to be a good camp; but there is nothing now to indicate anything better than one good paying claim in the quartz."

HUMBOLDT.

RAILROAD DISTRICT.—Elko *Independent*, Sept. 29th: The copper mines equal those of Battle Mountain. The silver mines are on the same range of mountains as those of Mineral Hill. The tests made of the copper show forty-four and a half per cent. of copper and seventy dollars per ton in silver. Selected specimens of the copper ore assayed as high as sixty per cent. Railroad District seems to have been appropriately named, having the line of the railroad as one of its boundaries. The distance from the mines to the nearest point on the railroad, does not exceed twelve miles. The owners have received an offer from an English company for two of their copper lodes, which they refused. They intend shipping ore to market.

REESE RIVER.

AUSTIN.—*Reveille*, Sept. 24th: "We miss the fellows that erewhile loafed about the street corners. A more earnest and better state of affairs now exists in this city. It is no longer a paradise for idlers. Nearly every man in Austin is at work, earning good wages and receiving prompt pay. One can scarcely find an absolutely idle man. Many are mining on their own account. We hear frequently of rich strikes made by these little parties of "chloriders."

BULLION—for the week ending Sept. 25th: Manhattan Mill, 9.816 ounces. Mettacom Mill, 6,172 ounces. For the week ending Oct. 2d: Manhattan Mill, 13,180. Mettacom Mill, 12,000 ounces.

LANE AND FULLER, same 29th: The report of this company for the year ending July 1st, 1869, shows that its mines have produced 1,029 tons and 558 pounds of ore, which gave a yield at the mill of $224,050.38, an average of $217.68 per ton. The main shaft has been sunk 445 feet; 3,282 lineal feet of levels have been run. The total receipts of the company were, $251,554.56; expenditures, $212,823.08.

CORTEZ. — 27th: Reports encouraging. The Wenban Co. employs fifty men. There are a score of prospectors in the hills. A ledge or deposit of copper ore has been located near Crescent Valley. At points it appears to be twenty-five feet wide.

MOREY DISTRICT. — Correspondent of *Empire*, 28th; Since Mr. Ogden bought the mines, not much has been done; owing to the White Pine excitement, which stopped the Hot Creek mill, (then rebuilding), and left no place to reduce ore. Now, however, Mr. Ogden has sent five tons of China-mined ore to Austin—120 miles—for reduction, estimated to yield $300 to $500 per ton.

SPRING VALLEY.—*Empire*, Sept. 21st: Small quantities of selected ore, reduced at the Austin mills, have yielded in some cases as high as $800 per ton. Negotiations are pending for the erection of a twenty-stamp ore-mill in the valley.

The same of 22d, says: A clearheaded, cool, and experienced acquaintance, just from Spring Valley, says the ore is rich, but that it is not yet established that there are any regularly refined ledges. Little work has yet been done.

The *Reveille* of Oct. 2d, learns that a very rich strike has been made at the depth of fifteen feet from the surface—the ore being a fine chloride, in which horn silver was abundant.

HOT CREEK.—Letters from "Singleline" to *Empire* of Oct. 1st: The "pure metal" is the most wonderful silver ledge I have ever seen. It crops out for 800 feet from 2 feet to 100 feet high; it is from 100 to 150 feet wide; in this body of quartz are three strata of metal-bearing rock, which vary from ten inches to ten feet wide—oftener feet than inches; it stands perpendicularly, extending due north and south, up to the southeast face of Rattlesnake mountain, and is cut in two by a natural cut, or cañon, of nearly perpendicular sides, and it can be seen with the naked eye for twenty miles. Ores assay in Shermantown $694 to the ton, and choice pieces in San Francisco, have given as high as $1,062. In my estimation there are thousands of tons of $100 ore on the top of the ground.

BATTLE MOUNTAIN.—*Reveille*, Sept. 29th: The Supt. of the new Co., has already shipped 11 tons of ore to S. F. Co., and will send forty more this month. It contains 30 per cent. of copper, and silver, up to $38 per ton.

WASHOE.

LADY BRYAN.—Gold Hill *News*, Sept. 27th: New mill started yesterday, and works to perfection. First, a Blake's rock breaker of the largest size; then two 5-stamp batteries capable of reducing 30 tons daily; then four of McCone's pans, each of which works 5,000 pounds at a charge, every 4 hours; then two huge settlers, in diameter 10 and 9 feet respectively, and 3 feet deep. Plenty of space under the pan-floors and batteries. All told, it is the best mill of its size in the State. The mine yields 60 tons per day, averaging $30 to $40.

YELLOW JACKET.—The south mine yields 160 tons per day, chiefly from the 800 and 900-foot levels. This pays all current expenses.

SIERRA NEVADA.—Ore improves as developed. Mill steadily at work and dividend regular. Same of Oct. 4th says a new vein has been struck.

HALE & NORCROSS.—The yield of ore is 145 tons per day.

BELCHER yields daily 20 tons of $30 to $160 ore.

CHOLLAR-POTOSI yields 175 tons daily—and ore improving. Same of Oct. 4th: Yield, 130 tons of $50 ore.

OVERMAN.—Winze completed, connecting 400-foot and 500-foot levels, giving good circulation of air. Yield is 25 tons of $20 ore.

VIRGINIA CONSOLIDATED.—New shaft is 335 feet deep—bottom hard. Same of Oct. 4th says: Shaft, 347 feet; rock, softer.

OPHIR.—Rock softer and indications more favorable. Same of Oct. 4th says: The drift west is in 643 feet.

JUSTICE AND INDEPENDENT.—Same of Oct. 4th: This mine shut down, for the present, on Wednesday.

IMPERIAL-EMPIRE.—Shaft nearly cleared out. Sinking will be resumed in a week.

GOULD & CURRY.—The average yield during the past week, from the old workings, at the upper levels, was 43 tons per day, of ore which yielded an average assay of $49 per ton. The prospects in the drifts, at the 7th or lower level, are not good.

WHITE PINE.

WEEKLY MINING REVIEW.—*News*, Oct. 2d: Now that White Pine is happily rid of croakers and do-nothings, and all are earnestly engaged in the development of our mines, a better feeling is manifested among our citizens. A feeling of entire confidence in the permanency and extraordinary richness of the mines pervades the community, and a firm conviction prevails among all classes that next season will be one of greater prosperity in this region than any yet enjoyed. Everything is busy, and before Christmas there will be 200 stamps running. Besides this increase in our milling facilities, there are a good many small furnaces under construction for smelting the ores of the Base Metal Range.

ITEMS.—*News*, Sept. 28th: Wooloomooloo shaft goes steadily down. It is now between 60 and 70 feet in depth, and the owners think the signs are improving.... In the Edgar, fine chlorides are found in all parts of the ledge yet exposed, and the thickness of the ledge is not known, for no foot-wall has yet been found....Tom Paine vein is now proved rich to the depth of 50 feet and the length of 60 or 70 feet.... Same of Oct. 2d: Rich strike in first extension of the Sheboygan ledge. Mammoth mine ledge 15 feet wide....Sagebrush sent 100 tons to mill, which yielded $150 per ton....*Empire*, Sept. 26th: The Prima Donna, Pride of the West, Argentine and Sierra Leone, four mines of the base metal order, three-fourths of a mile north of Swansea, were yesterday purchased by Dr. S. A. McMeans, Marshall Bryan, Dr. L. C. McKenny, and a Mr. Miller....Sixty-six hundred pounds of Emersley ore made a bar worth $467, which was shipped yesterday to Chicago....29th: Ditch to supply Stanford mill with water was commenced yesterday....Oct. 1st: Pogonip & Othello has 1,000 tons of good milling ore—much of it of a high grade—on the dump.... Silver Wedge shaft, near Hidden Treasure, is down 50 feet.

MILLS AND FURNACES.—*Empire:* Every part of the splendid Stanford mill was designed by W. H. Patton, who quietly says he has had his own way, and if everything is not right, there is no one but himself to blame. It is expected that the mill will be running in two weeks. It cost about $75,000; and will add to the bullion shipment of White Pine $30,000 per week....Bartlett & Vreeland, representing Boston capital, yesterday broke ground for a 10-stamp mill at Swansea. The machinery has all arrived at Elko, and the building is to be pushed rapidly. The mill is expected to steam up in 30 days....Freiberg is a new town in the cañon between Babylon Hill and White Pine Mountain. Several smelting furnaces are being erected there....A new furnace is going up near the toll house. ....Brook & Rathburn's furnace goes into operation to-day.

OUTSIDE DISTRICTS.—*News*, Sept. 28th: Robineon District is looking better every day. Comfortable houses are going up. Sam. Brannan's company is the one which gives back-bone—for it will have a mill ready to run in three weeks. A small furnace is building for experiments' sake.... Sacramento District is slowly improving. ....*Empire*, Oct. 2d: Davis & Martin's mill in Montezuma City, Patterson District, is in operation, and the rock turning out well. First shipment of bullion by Wednesday next....Considerable work has been done on the Nevada and Genie ledges, Bald Mountain District, 70 miles south of Elko.

Oregon.

CASCADE MOUNTAINS.—Dalles *Mountaineer*, Sept. 24th: Mr. Alex. Rogers and party left the Dalles about the 25th of July last, and traveled along the east side of the Cascade Mountains to the neighborhood of the Three Sisters, where, on a small stream running west, supposed to be the headwaters of the north fork of the Umpqua, they found placer diggings that will pay from $5 to $30 per day, with ordinary sluice-boxes. They continued further south, when coming to a new-made trail, they followed it up the mountain, and found three men engaged in quartz mining, using a large iron mortar to grind the quartz in. These men were not very communicative. The quartz in sight appeared rich in gold. They also found placer diggings within 150 miles of the Dalles, to which place Mr. Rogers intends returning.

Utah.

CLIFTON DISTRICT.—The Salt Lake *News* says the ledges in the Deep Creek Range are well defined, and can be traced for several thousand feet. There is a variety of ores. Assays of galena ores taken from the top of the ground run from $75 to $100 per ton. There is an abundance of wood and sufficient water for milling purposes.

ANOTHER GREAT BLAST IN GRAVEL.—On Wednesday another great blast of 37,500 pounds was set off, with better success even than was anticipated, as we learn by the telegraph—probably in the Crary & O'Brien claims, where a similar blast was made eight months ago.

Pracy's Governor.

We herewith give an illustration of Geo. T. Pracy's steam engine governor, patented through the M. & S. PRESS Patent Agency in 1868, but which has been slightly modified and improved in the elegance of its construction since published in the last volume of the PACIFIC PRESS. Mr. Pracy, who is now one of the longest, actively engaged machinists in San Francisco, has made a very liberal and worthy exhibition in the Pavilion, including a large number of various sized governors, one of which, richly silver-plated, is shown in the inclosure of the PACIFIC PRESS office.

This governor is simple, strong and cheap, and is meeting with larger sales than any other ever invented on this coast.

The engraving shows the regulator with the arms extended, as if in rapid revolution.

The balls are confined by jointed arms, hinged at the top and bottom, and having a knuckle-joint in the center. The slack is taken up and the valve of the regulator opened by the action of gutta percha springs, situated in the cylinders or pots on the right and left—operating by the plungers which are connected by lugs to the lower portions of the arms.

It is suited to any rate of revolution. The speed of an engine can be quickly adjusted by turning set-screws on the bottom of the cylinders which operate on the rubber springs.

Mr. Pracy is agent for the celebrated tools of Lucius Pond, of Worcester, Mass., and Tuft's patent shears, which are on exhibition near Pracy's engine. They are worthy of special examination by machinists. Further information of Mr. Pracy's works will be found in our advertising columns.

VIRGINIA AND TRUCKEE RAILROAD.—The local impression, sustained by the Reno *Crescent*, is that the Bank of California managers of this road do not care to complete it any further at present than to Carson, where they will obtain their wood and lumber by the Ives Lake Tahoe grade. The Carson *Appeal* says the road is to be put through to the Truckee without delay. So easy is the route from Carson to the Truckee, and so obvious the advantage, that the road will undoubtedly be completed to the meadows at an early day.

THE GREAT MISSISSIPPI BRIDGE AT ST. LOUIS is progressing very rapidly towards completion, under the energetic hands of the engineers in charge. Since June, from 1,000 to 1,500 workmen have been constantly employed. Capt. Eads furnishes a full report of his methods of fixing the piers, lowering the stone, constructing air chambers and air locks, sinking cisterns, etc., in the Missouri *Weekly Republican*, of Sept. 29th.

BREAKING off a bad habit gradually is generally found to be about as encouraging as pinching off one prickle a day, with the view of exterminating a Canada thistle.

THE most profound fools assume the greatest gravity, while the really wise man has his face always radiant with smiles.

San Francisco:
Saturday Morning, Oct. 9, 1869.

Galena from Salt Lake.

Mr. Woodhnll, of Little Cottonwood Cañon, thirty miles sonth of Selt Lake, has presented us a specimen of galena ore which we heve pleced on exhibition, and which is remarkahle for heing a very pure galena, assaying nniformly throughont the vein ahont $100 to the ton. It is fonnd thet sixty miles of wagon and 600 miles of railroed transportation does not consume the velne of the ore, which is at present shipped raw, needing not even concentration. The vein ie three feet thick, ie opened to 100 feet depth, end is eitneted high end dry in a monntain's side—as good a piece of property as can he desired. The lead is worth, besides, $50 per ton. The market price for ore of this description, on the wharf at Sen Francisco, is one doller per onnce for the silver it assays, and seventy-five cents for every per cent. of leed, provided it has the pnrity of 70 per cent. of lead. Mr. Woodhnll, who is an old emelter, reckons that in emelting there is a loss of ahont 10 per cent. The gangne is limeetone. A Philadelphia company which emelted in the vicinity a year ago, has drawn off, and Mr. Reese, the smelter, is engeged in making fire brick, et Salt Lake City, for Captain Dey, of the Stockton, Utah, lead mines.

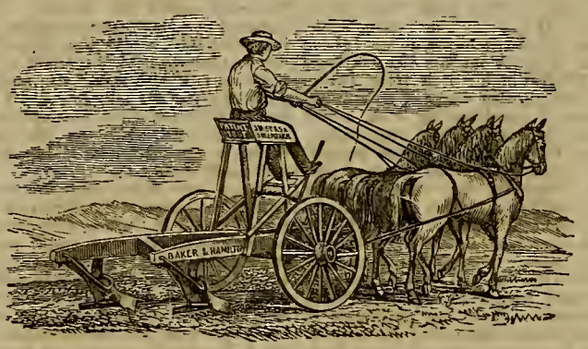
The Connor property is now held end managed hy a Chicago compeny, for whom Captain Day is soon to hegin emelting by a new process invented in Chicago. The Stockton ores assey $40 to $50 per ton, and the mines are ferther off from the railroad.

The California Trust Company.—There ie no institution in the city of San Francisco that is doing better service for the commnnity, and so nnobtrusively, as the California Trnst Company. It performs duties which it would be extremely difficult to find others to do es faithfully, cheaply, or well. For a mere trifle it takes responsihle cherge of all descriptions of pnhlic or privete papers, jewelry and plate, and keeps them inviolehly eecret end perfectly eecure in a fire, hurglar and earthqueke proof safe. It condncts a hanking bnsinese in any currency depositors may elect, peys a liheral interest on money deposited, collects bills and accounts, and acts as agents for tho transaction of all kinds of legitimate business. Ono scarcely knows the extent of the utility of such e well officered corporation till ite powers are tested. Wo strongly recommend the California Trnst Company as strictly reliable, efficient and moderato in charges.

Agricultural Implements—Their Invention and Manufacture in California.

Prominent in almost every brench of the agricnltnral department of the Mechanics' Exhibition, we find articles exhibited by the enterprising firm of Baker & Hemilton, of this city. The foremost among the articles entered by these gentlemen, we ere pleased to he eble to eay, is e Californie invention, eo widely introdnced on this coast that an epology would he dne from ne for illnstrating it in these columns were it not for the nnmerons visitors which the opening of the Pecific Railroad hes bronght to onr Pavilion, and the nnmerons copies of the Press which are heing daily sent to all perts of the Union and to Enropean conntries.

The Sweepstake Gang Plow, here represented, was patented by Mr. Snrsa several years eince, and is made et San Leandro by the Sweepstake Plow Company. It ie the gang which is most generally in nse on



THE SWEEPSTAKES GANG PLOW.

this coast. They are simple; will plow from two to ten inches deep, end any boy can plow with them. The manufactnrere hsve made over fifteen hundred of these plows, which are nsed ell over the coast. If any pert should wear ont, an exact dnplicate can be hed et the factory. They also exhihit two single plowe—one for adohe and the other for stnhble lend.

Another California article exhibited hy this firm, ie an ingenions power seed sower, called "Baker & Hamilton's California Gem Seed Sower." It throwe the seed like a man sowing with hoth hande, and by the nse of a lever one can sow on either side of the wagon in which the machine is pleced. The hroadcast seed eower heretofore nsed in this State throws the seed hy centrifngal force in a circle perpendicnlerly, so that a double qnantity of seed was eown in the rear of the propelling power. The Gem is said to sow all kinds of seede perfectly; and a very pecnlier feeture is, that it will sow blnestoned wheat.

Their Horse Fork is also worthy of mention here. It is made for enspending to the ceiling, is entirely of iron; end two forks, a horse, end a hoy, end a man on the stack, will take more straw to a thresher than twelve men. Where grein is threshed from stacks, e set of forks, it is said, will pay for themselves in two days.

All of the above are manufactnred by the "Sweepstake Plow Co." at San Leandro, where forty men ere employed constantly. The shop is 60x120 feet, with e foundry in the rear 20x60 feet. They run ten forges, blown by a blast driven hy e steem engine. All the work is done in the shop—cesting, forging, wood-work end peinting.

This factory is on the line of the Alameda and Western Pecific reilroads, end appeers to he very centrally located, and should be well petronized hy farmers who desire to keep their money here to bnild up onr own State, as long as the articles they make are as cheap and as well made as the imported.

Concerning the nnmerons imported articles exhibited hy this firm we shall speak in futnre, as many of them possess novel featnres of interest and importance to gen-general readers.

Forests, Grand and Primeval.

There are many respects in which California is not whet it wonld eppear to he at first sight, to e strenger. An overlander, or new arrival, encountere strange contrasts end wonderful enrprises; so varied ere the circnmstences of onr physical geography within narrow houndaries, that, compered with other conntriee, Californie is really entitled to the character of heing a land of wonders. We have no trees, no forests in eight in the valley to gladden and refresh ne; the atmosphere is too dry end the eoil too parched. Yet we heve in Californie the grandest forests in ell the world, the densest as well as those prodncing the most wonderful monuments of vegetable growth thet the traveler ever sees in any country. Since the Big Trees of Calaveras and the Meriposa Grove have hecome known and famous as amonget the world's wonders, we have maintained onr preëminence for the largest trees; but the impression has gone ahroad that there are only a e few scattering specimens of the great *sequoia*, end that the big trees do not grow here in extensive forests.

The redwood forests hetween Russien river end the Oregon bonndry, on the coast, are, for a hundred miles in Mendocino and Humholt counties, as dense end ee grand a forest as human littlenese ever fonnd itself in; and the trees are the seme primeval giants, in girth and etatnre, es the famone ones in Mariposa. Near Healdsbnrg, "Dntch John," the shingle maker, cut out of a eingle tree 180,000, to 200,000 ehingles, the former figure being common. One of these treee referred to in the Healdshurg *Flag*, meesnree 67 feet in circnmference, end 200 feet in heighth to the first limb, and will furnish, according to Mr. Bagley's calcnletion, 180,000 feet of lumher, meke split pickets to fence a ten acre lot, and fifty cords of wood besides. Another tree near Heeld's mill, called "The Stable," is hollow at the bottom, measures 27 feet across inside, and ie cepable of etabling twelve horses, with a hay mow to snpply them for a whole winter. The "Bean Pole," near hy, is not considered a large tree, bnt mcesures 344 feet in height.

Bnt on the north coast the *sequoia* has not exhausted itself in growing to an enormons size, so mnch as in endeavoring to show the world of science what the grand Primevel Forest was, end how the earth looked to its inhahitante in ages gone; to remind the Ceucasien lord of creation, as he comes to this jnmping-off place, that he has heen but a very small enimal, creeping among weeds and grass. On high promontories and mountaina overlooking the Pacific Ocean, the redwoods bask and flonrish in the afternoon sunshiue, alternated hy nightly Alaskan fogs.

That the range of the giant redwoode is not limited to a few groves, is further proved hy the discovery, just reported, of another body of treee es wonderful es those of Meriposa, near Kern Leke, in the extreme southern corner of Tulare Valley.

Hitchcock's Monthly.—The first number of e new illustrated magazine of this title, devoted to "choice music, art notes, and select reading for the family circle," is received from tho publisher, B. W. Hitchcock, 24 Beckman street, New York.

Rock Boring by Machinery Economically Successful.

So long es finely devieed machines, and paper celcnlatione of possibilities of horing hy steam, remeined the limit of the work of inventors in this direction—of making the miners, delving in pursuit of minerals more eesy—the mining world looked on impertnrhehly end donbtingly; end boring hy machinery met the general verdict of "not enccessful." For ordinery mining, or es a matter of real interest to money getters, machine horing has not heen thna far, therefore, a thing eetahlished. Eight or ten different kinds of horing machinee have heen et work; and verious reporte ee to their merits have heen puhlished from time to time. Yet the practical mining world is indifferent.

Ae something merking definite progress, we give the following in regard to Mr. Dœring's mechine, from the *Quarterly Journal of Science:*

"We find dnring a recent vieit to the Cornish minee, that the petentee is offering to contract for sinking shafts end driving levele upon such terms ee will, without douht, induce meny mine adventurers at once to close engagements with him."

"Dœring'e rock-horing engine hae been worked on the 185 fethom level in Tincroft mine, conjointly with enother, from the 6th of Jannary np to the preeent time, end hes driven sixteen fethoms in herd Tin Cepel, which Cept. Teagne coneidere wonld coet 20*l.* per fathom if driven by hand lehor. Dnring the greeter pert of this time, in consequence of the eir-pumps getting constantly out of repeir, the mechine was only worked hy one (shift) corpe of two men; end continnous working with three corps, comprising five men end one boy, only commenced on the 6th of July. Since thie date nearly ninc fethoms of grnnnd heve heen driven, et e cost of 17*l.* 16*s.* 2*d.* per fathom. The following is the cost of working the mechine during the last month:

	£.	s.	d.
Five miners and one boy	24	0	0
One boy to remove rubbish	2	0	0
Two enginemen at surface	6	0	0
One smith and boy	6	5	0
Oil, waste, and candles	3	9	0
Gun-cotton for blasting	4	10	0
Fuse	0	7	0
Sundries	0	3	0
Coals	6	0	0
Repairs	2	0	0
	£53	14	8

Amongst the rock-boring mechinee that we rememher are the Annnlar drill of Mr. Case, a New Hampshire inventor; the Lomeiller, used in the Mount Cenis tnnnel; tho Bergstrom, a Swedish miuing engineer (described in Berg & Hutt's *Zeitung* of last year); the Saxe, a mining engineer of Altenherg, near Aix; the Schwartzkopf, used in Silesia; the Schnmenn, Modelmeister, at the Freiherg Mining Academy (deecribed in Rzhihe's *Tunnelbankust);* the Hoosao Tunnel machine, (described hy Mr. Dewey in the M. & S. Press, of April 14th, 1868); Lowe'e machine (described in the *Stuttgart Polytechnic Journal);* the Hanpt machine, nemed efter the Philedelphie civil engineer; end the Phillips, e White Pine miner, (decerihed in the M. & S. Press of Merch 27th, 1869.) Gen. Haupt's machine is ahont to be introduced into the lead mines of Sweledale, in Yorkshire; and Mr. Lowe's machine is in uee in eeveral lerge reilwey cuttings and tunnele in England.

Some interesting facts tonching the practical velue of severel of the hest working machines nsed in the Harz end Belgium, will be given in another erticle.

Musical Instruments.—Mr. W. Willis, leader of the splendid hend which forme euch en ettractive feature of the Fair, is the eole egent for Schreiher's petent American cornets end hrees band instrnments. The instruments used et the Fair are of this meke, and their tone ie the best testimony of their qnality. They reqnire no hetter trumpeting.

The Goodyear Hard Rubber patentees are lawing in the San Francisco Courts, ageinst Winter, Hield and others, who have been infringing, as they claim, npon their patent.

The Overland Monthly.

The October number of this magazine has a most appetizing hill of fare. Half, at least, of the titlee displayed in the tabls of contents, are tempting. We have read "Knapsack and Blanket," aud "Tennessee's Partnsr." In the latter wo recognize the pen which has furnished those peculiar sketches of early California life which have always been to ns the chief charm of the *Overland*. Only a '49er could produce such pictures,—and mighty fsw of those. The writer is plainly not giving you hearsay. His painting is too vivid for that. One who transfers to the very page before you every tint of the landscape, and suggestively recalls to your ear every passing sound, has boen "there." And this writer has not only been thero, but when there he grasped every "situation," and with the instinct of genius entered fully into its spirit. Hs is true to this, whether describing the crowd of gambling roughs in an early canvas camp, or the quiet circle of now grizzled smokers who tell stories of former "strikes," and still dream of "home" as the place they left. His pathos and his humor ars eqnally genuine. He excels especially in showing you tho soft and kindly side of rude and strong,—even of criminal,—natures. And such were plenty here in '49. "Tennessee's Partner" is by no means the best of these sketches of his; but it is good enough to furnish us a text. The *Overland* is sure to bs read as long as there is a '49er in the land who has escaped whisky. For he will always hope to find one of these characteristic articles in it. Its enterprising proprietor, Mr. John H. Carmany, will take care that its high reputation shall in every respect be maintained.

Stationery.

This very important branch of our importing and manufacturing interest is overlooked by the mass of our community, although occnpying the attention of a large number of persons directly interested. Every one knows the importance of "pen, ink and paper," but few are aware of the extent of their importation and manufacture. Althongh a largo part of this class of goods is made in Europe, principally England, France and Germany. it is nearly all purchased in the Eastern cities from agents of the producers.

Gradually the sale of drawing paper has been added to the stationery businese, until at the prcsent time it demands a considerable portion of the attention of dealers. Balston & Co., of Maidstone, Kent, England, are the manufacturers of J. Whatman's drawing papers, which are nsed almost exclusively by our draughtsmen and architects.

Onc firm in this city,—Messrs. George B. Hitchcock & Co., corner Sansome and Commercial streets,—import a large portion of their etock direct from the manufacturers, and neing particular care in its eelection, have secured the largest retail trade in the oity.

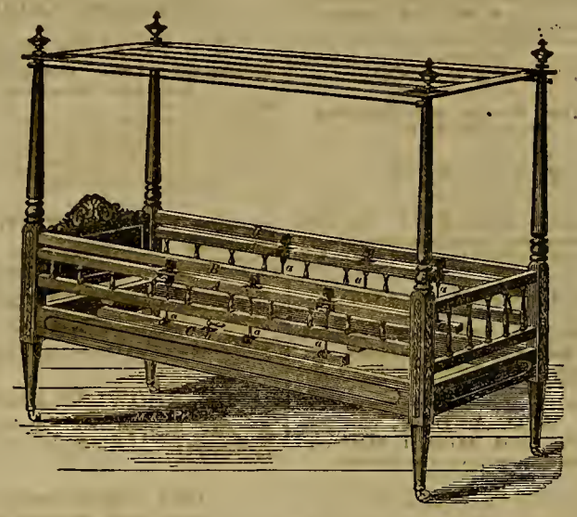
They are now manufacturing all the finer grades of blank books, letter presses, iukstands, wallets, portfolios, etc., and, judging from their immense sale, are giving more than ordinary satisfaction. A fine exhibition of their usual style of blank work, eto., may be seen south of the main aisle, above the fountain.

A New Invention.—A new school strap, for carrying books, hae been invented by a lady of this city, a model of which has been made by Main & Winchester. It is a very neat design, simple, but convenient. It is made to carry elate, pencil, pen and lead pencil, has a handle, and can be enlarged or ensmalled to suit the number of books to be carried. The object of the strap ie general utility and convenience for the school children. It will be eold by Warren Holt, at 411 Kearny etreet. The patent will soon be expected, and the price of the article put low, that every girl and boy can have one. It is hoped that the new invention will fill just the wants of the children, who complain hitterly of the awkward straps and inventions now used. There is much inveutive genius being displayed hy our California ladies just at present.

Confining Bed-Clothes—Improved Crib.

We give herewith an illustration of a method of so confining the bed-clothes upon a crib or bed that they cannot be rolled or kicked off by children or other persons sleeping under them. Ths invention is intended to apply more particularly to crihs or beds for children and invalids.

Referring to the engraving, the upper rail is called a lifting rail, and is attached by the small iron rods, *a*,*a*,*a*, to the short or clamping rail, C, the rods passing loosely throngh the two npper permanent rails of the crib. The bed-clothes to be held in place are drawn outwards between the short clamping and the lower main rail. This may be readily done by raising the upper or lifting rail, to which the clamping rail, C, is attached by the rods *a*, *a*, *a*. After ths



INWOOD'S PATENT FASTENING FOR SECURING BED-CLOTHES.

clothes are so arranged, the clamping rail is pushed downwards and seoured in plaes by the set screws near the top of the rod, in the rail, A. The rails upon the opposite side are adjnsted in the same manner. The inventor, Mr. George Inwood, of this city, exhibits three cribs and one large double bed, with thie arrangemsnt attached; by an examination of which, the advantages and mods of operation of the invention may be readily seen and understood. Newly-married people may learn an important and useful lesson by examining Mr. Inwood's exhibition, patented by the Mining and Scientific Prese Patent Agency.

The Risdon Iron and Locomotive Works.—Among the few branches of industry which cannot be very broadly represented at the Pavilion, we may mention that of ship-building and marine engine construction. In the latter branch, the Risdon Iron Works, though a very recent organization, has attained a most noticeable position. During the single mouth of Augnst, or very nearly within that time, thie single firm added to our steam marino not less than five steamers, aggregating 2,000-horse power, ae follows: New steamer launched from North'e ship-yard, about the 1st of September, tor the South San Francisco Ferry Company; the Neptune, the Vallejo, the Monterey, and the H. H. Buhne. The first mentioned has demonstrated hor ability to reach a epeed of 18 miles an hour; and the entire series affords a striking evidence of what our workshops can do when they are pressed. Nothing connected with the vessels mentioned was imported except a portion of the raw material. All the lumber, knees, etc., is of California growth; all the shafts are of our own forging, and the casting, both iron and brass, of our owu manufacture. A portion of the iron work was from Oregon iron. These facts speak volumes for the energy and enterprise of Califoruia, aud for the skill of her mechanics. We have in hand the facts in full connected with the construction, dimentions, etc., of these steamers, which will be given at an early day.

Cabinet of White Pine Ores—An Aged Worm.

The splendid collection of Messrs. Biggs & Gardner is now in place, aud arranged in proper order in the front gallery of the Mechanics' Institute Pavilion. It contains magnificent specimens from one hundred and seven mines of White Pine and the limestone region, consisting mainly of chlorido of silver, green and blue carbonates of copper, silver glancs, antimonial ruby silvsr, galena, stetsfeldtite, and variously colored carbonates of lead, with probably also some snlphate of lead. The gangue is to a considerahle extent silicious; and from near the famed region of chlorides there are likewise produced eome very massive pieces of iron ore—micaceous iron and hematite—presenting evidencss of having besn precipitated from ferruginous waters. The fossils most noteworthy iu the collection ars a lily encrinite beautifnlly preserved, and a little rolled up crustacean worm, half the size of one's little finger nail, which Mr. Biggs says he found alive, encased in solid rock. A specimen waa broken up, and this (according to the oeular testimony of hoth Messrs. Biggs and Gardner) fell out, sprang up a few inches, gave signs of life for half au hour, and was then gensrously treated to a whole bottle full of prospectors' whisky, in which he ended his long and lazy life of geological ages, since the silurian, or perhaps the carboniferous period! The stone and the silicious casing, out of which the specimen came, is preserved, so that it is yet possible to investigate whether it may not merely have got into a cavelet in the rock, or bored its way in, as we surmise. The curiosity will undoubtedly be examined, and reported upon by some one of our competent naturalists.

Bring Us a Road Steamer.—Mr. David Watt, of Grass Valley, is in Scotland, where he has been examining one of the rubber-tire road steamers that rune over common roads of "any grade," says the Grass Valley *Union*. Ho will probably bring one of these road steamers to California, and give the Tide Land Reclamation Company an opportunity to try its merits for drawing gang-plows.

Dull Times on the Columbia.—The O. S. N. Co. has discharged all their machinists and closed the shops, throwiug out of employment some eleven or twelve men, most of whom have families. The reason for this, as we understand, is on account of the slack in bnsiness, the company at the present time doing hardly sufficient to pay incidental expsnses.—*Dalles Mountaineer, Sept. 2d.*

Mastadon bones in large quantity are reported by James Halford in Grizzly gulch, near Helena, (Montana)—showing that the fresh water Pliocene beds of the Upper Missouri extended over that regiou.

New Publications.

The Fresh Water Tide Lands of California. San Francisco: M. D. Carr & Co. pp. 50.

This is a pamphlet issusd undsr the anspices of the Tide Land Rsclamation Company, whose operation on Twitchell Island, and other islands in the vicinity of Sherman Island, have been referred to at length by us. It contains an introductory statistical article and two engineers' reports—Gen. Alexander and Sherman Day—with a large nnmber of articles on the the same subject that appeared in the *Alta*, *Herald*, *Examiner*, *Call*, *Times*, Grass Valley *Union*, M. & S. Press, *Bulletin*, *Courrier de San Francisco*. The Reclamation Company has also published a map of the tule lands in the central part of the State, which will facilitate an nnderstanding of the operations of reclamation.

The Law of Storms—The Various Phenomena by which their approsch can be ascertained with certainty, and practical directions to mariners for the avoidance of their fury. Compiled from various sources by Captain John Ross. A. Roman & Co., San Francisco. 12mo.

We commend this little work of Captain Ross as practical, pithy and reliable in its data on which conclusions are based, and up to the times in the science of msteorology. It is in the main the working rules of a practical sailor, and is based on Dore's Law of Gyration. Fitz Roy, Piddington and other authors' ideas are used intelligently. A sea voyago can be rendered quite intsresting with a companion of this kind, though it is intended especially for the use of mates and master marinsrs. Printed by Spaulding & Barto, at the Mining and Scientific Press Job Office.

The Ruthven Hydraulic Propeller *versus* The Screw and Paddle. Published by the Hydraulic Propeller Company. 8vo., pp. 64. London. For sale by A. Roman & Co.

An attempt is here made to prove that the new method of propelling ships invented by Mr. Ruthven, is more economical and faster than with the screw propeller—the whole being based upon facts and figures developed from a number of competitive trials betwsen the British double-screw gunboats Vixen and Viper and the hydraulic propeller Waterwitch, in 1867. Instead of the paddle-wheel or screw propellers *outside*, the hydraulic has a water-wheel placed horizontally, inside the vessel, inclosed in a metal case, situated under, or about, the water line of ths vessel; and water is supplied to the wheel through a series of apertures in ths bottom, leading into the wheel-case. The water, by action of the wheel, is expelled through the conducting tubes into the sea again, from the nozzles on the outside of the ship. Inventors interosted in euch questions will find data incorporated on which conclusions may be safely based.

"Beton-Coignet," by Leonard F. Beckwith; and "Asphalt and Bitumen" and "Macadamized Streets," by Arthur Beckwith. Paris Exposition Reports. Government Printing Office, Washington. For sale by A. Roman & Co., San Francisco.

The importance of these enbjects and their interest to engineers is eelf-evident, when we reflect that almost every engineering work has something to do with these earth-compositions, for epecial purposes and usee to which certain kinds are better adapted than others. The national government is doing a good thing for the couutry in thus disseminating the latest and moet valuable information from the "Expositiou Universelle," with suitable working illustrations, and chiefly on practical subjects—worke that would scarcely warraut a publisher in this country to enter upon in a etyle that would do justice either to the matter, or be of substantial service to the interests concerned. All who work in concrete, mortars, bituminous and other compounds for walks, pipes, etc., will find it a cash loss, for example, to be without euch information as this, that is now available to the world. Many of our best engineers crossed the ocean and devoted themselves to a working up of their own specialties at Paris in 1867. We hope that much more of the same kiud of matter will be issued from the Government Printing Office.

Rhinoceros Teeth and other Fossils Under Table Mountain.

[Written for the Mining and Scientific Press.]

EDITORS PRESS:—Some time last summer, Mr. D. T. Hughes, of the Maine Boys' Tunnel, at Table Mountain, in Tuolumne County, dug a strange looking tooth and bone out of the auriferous gravel of his claim. They were perfectly preserved, and Mr. Hughes, appreciating the value of these relics to science, presented them to me for description. They were carefully packed and forwarded by Mr. George A. Treadwell, of Tuolumne County.

An examination of these fossils shows conclusively that the tooth belonged to a rhinoceros, the species described by Dr. Leidy, of Philadelphia, as *rhinoceros hesperius*, and that the bone belonged to a large animal allied to the elk; possibly the bone of a large species of elk. This bone was broken before being deposited in the gravel, and its surface shows, in the most unmistakable manner, that it had been gnawed by carnivorous animals, for the grooves made by their incisor and canine teeth are clearly visible.

This bone was taken out by Mr. Hughes, at a point in the tunnel 1,776 feet from the mouth, and over 300 feet below the surface, and about five feet above the bed-rock. The tooth came from about the same distance below the surface, and 1,840 feet from the entrance of the tunnel.

This discovery makes a valuable addition to our knowledge of the fauna of that ancient valley anterior to its filling up by detritus and lava.

Careful inquiries made at my request have failed to verify the reported occurrence of stone implements in the stone formation, so that we are still in doubt whether man existed in that region contemporaneously with the rhinoceros, the mastodon, the elk (?) and other animals.

As you may perhaps think the facts of this communication sufficiently interesting to insert in your columns, I would like to direct attention to the importance of carefully saving any and all fossil bones which are found by the miners, from time to time, in the progress of their underground explorations, and of sending them to the proper persons for identification and description. It is probable that very many relics important to geologic history in California are annually lost.

New Haven, Conn., Sept. 25, '69.

Yours, etc., WM. P. BLAKE.

[We have on several occasions noted the finding of stone relics in auriferous gravel under lava, with what seemed to us the most unequivocal testimony of their location in formations older than the "lava period;" but we shall be pleased to hear of further discoveries, and such, if possible, as will satisfy the most critical students of the geology of the "Stone Age." —ED.]

THE USE OF BAND SAWS.—The band saw, which may be seen at work every evening at the Pavilion, exhibits a principle which is deserving of more general introduction into our wood-working shops. There is a great saving of power connected with that mode of sawing, to say nothing of the superior and more speedy manner in which work can be done by such saws. Great difficulty was encountered in their early introduction, by reason of their frequent breaking, and the difficulty attendant upon replacing them. The improvements of late years introduced into the manufacture and tempering of steel, and in the process of welding, especially by the use of "silver solder," has now rendered their use quite practical. There is no reason why they should not come into more common and varied use. They might doubtlessly be advantageously employed in many cases where circular and jig saws are now used.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.
"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a perfection for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage."
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate. Steam Mills, Brick Lane, London.

To Quartz Mining Companies.
To be sold positively within the next three months—the MINES, ENGINE, MILL, and entire Machinery of the TEMPLAR NO. 2 Quartz Mining Company, located at Indiana Ranch, Yuba County, consisting of—
One Steam Engine, 60-horse power, made by Burden, Brooklyn, New York.
Two large Boilers, in complete order.
One Eight-stamp Battery.
One Chile Mill.
One Cornish Lift-Pump, 6 inches, of superior make and finish.
280 feet of 8-inch Iron Suction Pipe.
One large Water Tank.
And also all of the necessary machinery, with Belting, Feed Pumps, Hose, Turn Tables, Cars, Ropes, Track Iron, Flumes, Plates, with Blacksmith Shop and all Tools and requisite implements to be found in a large and first class quartz mill.
The Company having ceased operations intend selling off their effects as speedily as possible.
For particulars as to price, etc., address, by letter or otherwise, L. W. CAMPER, at Indiana Ranch; GEORGE B. HORNISH, Marysville; or R. W. HASKELL, Pacific Fruit Market, San Francisco 24v18-1m

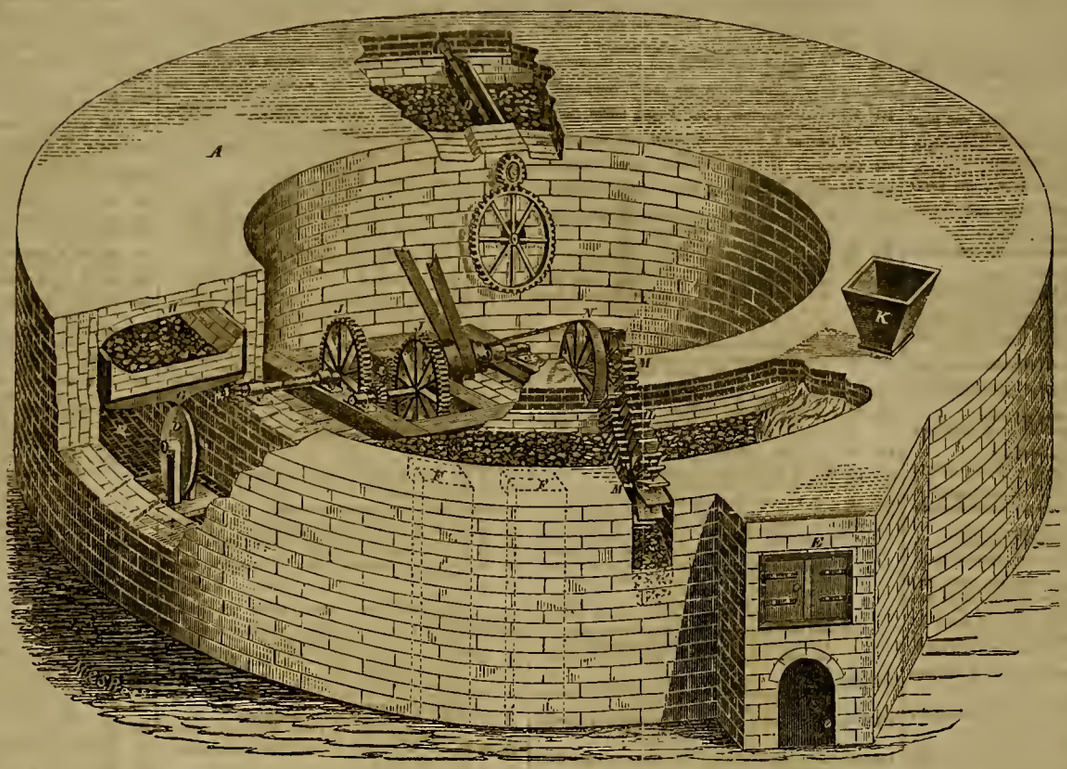
Fred. Ernst's Patent Rotary Roasting Furnace.



This is a mechanical furnace, which does away entirely with manual labor, excepting a fireman. It charges, roasts, stirs, and discharges the ore by a very simple mechanical contrivance,—in fact performs all the operation required in the oxidation or chlorination process of roasting gold or silver ores.

The ore is taken by means of an elevator from the battery, and is discharged constantly and regularly into the hopper, *K*, from whence it reaches the rotating hearth, *G*. This hearth consists of a cast iron orbicular ring paved or lined with bricks, and revolves on a series of iron rollers, *D*, and is kept continually in motion by means of the gearing, *J*. This gearing has two gear wheels, three feet in diameter, and pinions to regulate the speed from the cone pulley, increasing or diminishing it to conform to the required slow motion of the hearth, *G*. The hearth so charged and running constantly carries the ore into the first heat, which is next to the flues, and so passes all the different temperatures of the furnace, thus effecting a very uniform heating and chemical action on the ore; at the same time it has also to pass the stirrers, of which there are different kinds,—stationary and movable ones,—the number and speed of the latter varying according as the ore contains more or less sulphur. The movable paddle stirrers are shown at *O*. These movable stirrers are connected with the gearing under the iron bed of the hearth, *G*, as shown at different points, until it passes the fire-bridge, where it receives its ultimate and highest heat, and is then discharged by the discharging apparatus. This discharging apparatus consists of two chain or rag wheels, *M*, *M*. These two chain-wheels drive a double endless chain with inserted plates of iron (scrapers). The chain hanging loose underneath between the wheels draws these iron plates through the cavity of the hearth, and so discharges constantly the roasted ore. To keep the current of air constant throughout the whole length of the furnace, the arch over the hearth decreases slightly from the fire-bridge toward the flues. For concentrated sulphurets it may be advantageous to increase the circumference of the hearth. The advantages claimed as attainable from the use of this machine are—the doing away with a large portion of the costly hand labor ordinarily required, and the better and more thorough accomplishment of the same by machinery. A great saving of fuel, not only through the length of the hearth, but also for the reason that all the gases which are lost by other furnaces are economically employed in this as a substitute for other fuel.

The furnace is so constructed that the large access of air required for the oxidation of the ore, in addition to that demanded for the consumption of these gases, does not operate to materially lower the temperature in the furnace. When the ore in this furnace is once desulphurized, the gases cannot form any new combination with the ores or metals therein, for the reason that while the currents of air and gases are moving to the rear, the furnace hearth is constantly advancing in an opposite direction.

The construction of this furnace is of the simplest kind, and all the necessary castings can be easily transported even on mule-back. The loss of the silver by sublimation in present furnaces, it is claimed, is avoided in this, as the silver condenses before reaching the flues; the distance being great, and the heat diminishing gradually until the gases reach the point of final exit. Liberal terms are offered to parties who desire to use this furnace. Further information can be had by addressing the Inventor and Patentee,

F. ERNST, San Antonio, Lower California, Mexico,

Or by calling upon H. W. SCHMIDT, Druggist, Kearny street, corner of Sacramento, or at this office.

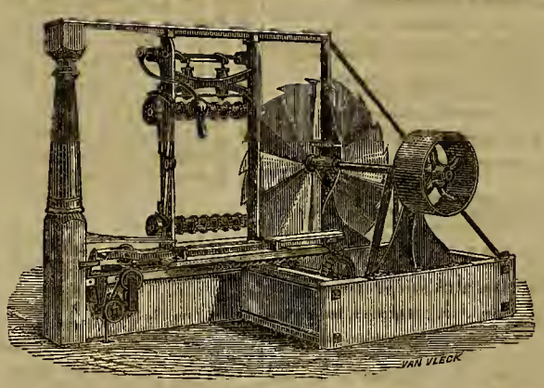
A Curious Optical Illusion.—Everybody knows Perkins, the great California seed man, and almost everybody has seen the photographs of his not very handsome, but kind looking face; and consequently, it is generally known that he has only one eye, but that is a keen one for business, or for a joke. One of the seed merchants on Front street was bantering Perkins about people getting on the blind side of him, and so forth, when the old fellow offered to bet $20 that he could see more with his one eye than the merchant could with two. The bet was promptly taken, and the stakes put up, when Perkins said that with his one eye he could see that the merchant had two eyes, while the merchant with his two eyes could only see that he (Perkins) had one. The laugh was loud and long, when the explanation was given, and Perkins declared the winner.

Another Galvanic Protection for Iron Vessels.—A method of protecting iron vessels against rust and corrosion has been proposed by MM. Dance and Bertin. They contemplate the conversion of the hull of the iron vessel into a galvanic battery, by placing, inside the hull, pipes and tanks made of zinc and filled with sea water, and connected by means of bolts and rivets in metallic contact with the outer side of the vessel. They also design to use strips of zinc on the iron plates of the vessel immersed in the water.

Extraordinay Occurrence.—On the 20th instant, while a number of ladies were laughing and talking together at Vallejo, one of them talked so much that she dislocated her jaw! Heavens and earth! what a strain there must have been to effect such a displacement! Jones says he knows quite a small, weak woman who can talk three hundred and ninety-seven words a minute for eighteen hours without disarrangement of her talking gear; and will not believe that a woman's jaw can be stopped except by force.

Put an Englishman into the garden of Eden, and he would find fault with the whole blasted consarn; put a Yankee in, and he would see where he could alter it to advantage; put an Irishman in, and he would want tew boss the thing; put a Dutchman in, and he would proceed at once to plant it.—*Josh Billings.*

HUNTINGTON'S IMPROVED SHINGLE MACHINES.



SHINGLE MAHINES CONSTANTLY ON HAND.

Steam Engines, Saw Mills, Lath and Picket Machinery, and Flax-Breaks,

MADE TO ORDER.

F. A. HUNTINGTON, Manufacturer,

SEGREGATED BELCHER MINING CO.—Trustees: A. K. P. Harmon (President), A. Hayward, J. P. Jones, J. A. Pritchard and John Gillig.

THE Avitor, it is said, has gone up. This is a mistake. Neither it nor its projectors have gone up. They don't "give up the ship" yet.

What Makes Our Doorkeeper so Very Healthy.

[From the Daily Fair Press, October 4.]

Our doorkeeper at the Fair is a remarkable man. Every one remarks him. He is a personable men, and a jolly; and his countenance is as the rising moon in harvest time—eginificant of a full crop.

He laughs nervously withal, at times, and emiles frequently a jovial smile, for his mind ie at rest, and qualms of conscience are lo him unknown.

Seeing him ever smiling and benigu, the frequenters of the Fair have begun to reason with one another, concerning our doorkeeper. "How is it?" they eaid, "that a man who keeps the door,—naturally allied to turnpike-keepers, who are all misanthropic,—"how is it that such a man is jolly and pleasant as a champagne punch?" and they went about to discover the secret, and could not find it.

But the secret camo out; and it was a woman that discovered it. What cannot a woman do! Her emilee have made many a hero front every form of death; her witchery laughs at the wisdom of philosophers, and makes Michael Reese invest in gingerbread. It was a woman that sat in the gallery of the Pavilion, and let her rovingeyes wander at will among the gay throngs. She saw young girls, with long hair, young dandies with short wits, lovely women with bonds, Grecian and other, and bravo men with natural etoops. She saw all this, and more. She saw our rosy doorkeeper in company with a serions-mindcd man, well knowu to the Directors and exhibitors, approach a keg of bitters, and pause, emiling like clockwork.

Deftly our doorkeeper drew forth a key,—snch a technical key as vintners use,—and with pleasant alacrity inserted it in this keg. The serious man did not smile; he had a presentiment of coming fate. The key was turned, when crack! it broke, and the cordial liquor spouted on tho untasting floor. Our doorkeeper changed color, and seized the serious man's hand; with gentle force he placed the thumb and serious forefinger on the yawning spout; and therewith staunched the tide of life. That done, he drew a long breath, and looked with pride at the serions man. The serions man did not smile; he felt that there was a time for all things, and to every thing under heaven a scason; and he whispered hoarsely to our doorkeeper—"Fetch a plug!" "Ah!" said the doorkeeper, "I believe you; only hold fast as you love every good and perfect gift." And he withdrew, full of beaming comfort, to seek for plugs.

How long he stayed, or whether he ever returned, or in what condition he found the serions guardian of his casket, who can tell? For the lady says, that when the doorkeeper was gone, for the first time a smile irradiated the countenance of that solemn, serions man; he wrestled with himself, as if in prayer, and bent down his head in anguish of spirit, until he touched the hand that held the spout. But she saw no spouting; only the barrel, and one waiting for our rosy doorkeeper.

THERE is more mechanical skill reqnired in building a flight of stairs than iu erecting the whole frame-work of an ordinary house. HIBBERD, SANBORN & Co., South Point Mills, Berry street, make etair building a specialty, and have fitted up some of the finest jobs ever done in this city. They have the contract for the ornamental stair work of the Grand Hotel, to be opened in May next by Messrs. Johnson & Co., corner of Market and New Montgomery streets.

THE Austin (Reese River) *Reveille*, a daily noted for its repleteness in l cal intelligence, gives its readers the foll wing San Francisco item:

ENTERPRISE.—Dewey & Co., of the *Mining and Scientific Press*, of San Francisco, publishes a little paper called the *Daily Press*, which is devoted to incidents and matters of interest connected with the Mechanics' Institute Fair. The printing press is propelled by steam from the boilers outside the Pavilion.

AN IMAGINATIVE writer says: Woman is compounded of three articles—sugar, tincture of arnica and soft soap. Sugar, because of the sweetness which is apparent in most women—alas! that in some it should have acidulated into strong domestic vinegar; arnica, because in woman is to be found that quality of healing and soothing after the bruises and wounds which afflict us men in the great battle of life; and soft soap, for reasons too obvious to need specification.

THE BLAST for Hanscom & Co's furnace while smelting in the Pavilion on Wednesday evening, was furnished by a Stutevant blower, attached to Troadwell & Co's Hoadley portable engine. The blower mado 2,500 revolutions per minute, and Mr. Doane thinks he could havo nearly doubled its speed.

AN ill-natured fellow says thero is a decided difference between Providence, R. I., and Divine Providence.

One Per Cent. per Month

Allowed on Six Months' Deposits by the CALIFORNIA BUILDING, LOAN AND SAVINGS BANK, California street, one door from Sansome.

THOMAS MOONEY, President.

August 2, 1869. 6v19 1m

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1865, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different special ties, and six assistant instructors.

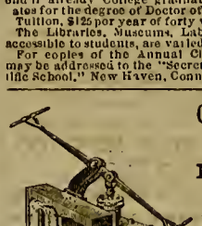
Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY. and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p



Clark's Detached
DOUBLE-ACTINO
Lift and Force
PLUNGER PUMP.

Patented May 18, 1869.

Lifts water continually without check, or causing sudden strain in operating the piston, as is usual in the ordinary pump. The interior of the Pump is always submerged in its own action, and is always ready for use without priming. For economy and durability this Pump is sure to recommend itself for use in all places where water is required to be lifted or forced. The superiority of the plunger pump over cylinder pumps has been well tested, and needs no comments. For use as a ships' pump, mining pump, clearing cellars and other places where muddy water is to be elevated, this pump cannot be excelled, as the packing is protected from wear and from being cut by sand. Where the cylinder pump would be cut and worn almost useless by sand in a few hours, this pump will remain in good working order for years. In fact, it is the only new and reliable pump which has been invented since suction was first used for raising water, and will be the CHEAPEST and BEST Pump in use.

WILLIAM H. T. CLARK, No. 31 Third Street, San Francisco, is the inventor and patentee, to whom all letters for information should be addressed. 5

SPECIAL NOTICE.

TO DEALERS AND CONSUMERS

—OF THE—

H & L
AXLE GREASE.

Having received your liberal patronage and support during the last fifteen years, and desiring to further extend its consumption, and if possible meet the wishes of our Chicago friends, we have made a great reduction in prices, and from our long experience we will satisfy you that there is none BETTER, and through your liberal patronage that there is none CHEAPER.

HUCKS & LAMBERT,
144 Natoma Street.

Depot, 320 Jackson Street.

N. B.—We are prepared to furnish Bulk Packages to contractors on equally liberal terms.

McAFEE, SPIERS & CO.,
BOILER MAKERS
AND GENERAL MACHINISTS,

Howard st, between Fremont and Beale, San Francisco.

Flue or Tubular **Boilers**, with plain circular or spiral courses. Upright Flue or Tubular Boilers, Locomotive and and Marine Boilers, and Wrought Iron Tanks of every description.

Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, light of the fall, and total length of pipe, as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.

Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.

To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, supply new heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.

Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care

To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas, but not the practical experience necessary to put the same in form, by making Drawings of their Inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their inventions. Office, No. 226 Clay street, San Francisco. oc2

Notice.—The adjourned Annual Meeting of the Stockholders of the WASHTELLO MINING COMPANY will be held on MONDAY, October 18th, 1869, at the office of J. F. Hubbard, Esq., Room No. 3, Dayward's Building, California street, at 8 o'clock P. M.

DANIEL McLEOD, Secretary.

San Francisco, Sept. 24, 1869. se25-2w

Job Printing.

We employ the best workmen in this department, and promise our customers—(many of whom have patronized the office for over eight years)—the best of work at very fair and uniform rates.

We are constantly adding new presses, type, and other material to our stock, making our facilities good for doing a wide range of work for merchants, mechanics, inventors, manufacturers, and tradesmen of all classes.

TO ENGRAVING AND ELECTROTYPING, for illustrating books and circulars, we pay particular attention, guaranteeing our customers satisfaction in this line difficult to be secured elsewhere.

Printing in colors, bronze, plain and ornamental style promptly done. Especial care given to working engravings

SPAULDING & BARTO,
"Mining and Scientific Press" Job Printing Office,
No. 414 CLAY STREET, S. F.

Spice from the Daily Fair Press.

The first odd-fellow—Adam.

No wrong will ever right itself.

A Musical cow hell(e)—A siuging milk-maid.

Benevolence is the cream of the milk of human kindness.

How could "Old Dog Tray" be faithful, and at the ssme time he-Tray?

Why are friends like cheese? Because the oldest is the strougest.

The embers of the dying year—September, November and December.

Men differ considerably, hut gentlemen are alike wherever you meet them.

Shringfield is to erect a bronze monnment to her soldiers. Fisk, Jr., contribntes the brass.

J. Ross Bhowne is to sell China ware to *Harper's* in the shape of descriptive articles and plates.

Money and morality are very much akin. The principle never loses sight of the interest.

Many a writer for the press has gained greater fame by his blunders, than hy auy thing else.

Why is a washwomau the most crnel person in the world? Becanse she daily wrings men's bosoms.

Truth looks best when nearest naked, while falsehood would he repnlsive were it not for the heauty of its dress.

Explanations of the Harvard defeat are still coming in. We have had enough already to account for 250 defeats.

The msjority of men go throngh the world much the same as the water—seeking the lowest levels, so as to go easiest.

What is that which the rich mau wants, the poor man has, the miser spends, and the spendthrift saves? Nothing.

Mrs. Porter is thonght to have the inside track in the race for the Lonisville post-office. We willingly sup-Porter.

The man who never makes any mistakes is a good deal like an augle-worm which has not sufficient conrage to get far from its hole.

Aggravating.—One of the couicts in the New York State prison, has fallen heir to $10,000, but can't get out to enjoy it for ten years.

A humbug iz like a hladder, good for nothing till it iz hlowed, but then aint good for nothing after it iz pricked.—*Josh Billings.*

A Novel establishment, at which dogs are to be washed and thoronghly freed from fleas, at fifty cents each, has heen opened in New York.

An old bachelor thinks the trails of ladies' dresses infernal machines, from the fact that a blow np took place directly after he had put his foot on one.

An Arkansas hoy got behind a bnsh the other day, and imitated turkey talk so successfully, that he got a charge of hnck-shot from his grandpa's fowling piece.

Two enormons sides of California hacon were to be seen in the Fair on Saturday. They helonged to Mr. James Bacon, of Petaluma, and weighed 287 pounds.

The papers are heginning to atyle Gen. Sherman "the coming man." The Georgia people have no wish for him to come that way again.

What is the difference between a dog belouging to a sailor and one of the priucipal planets? One is the tar's dog and the other is the dog star.

Appropriate.—The lady who wore the longest trail to her dress at a grand hall in New York, was the danghter of the contractor for sweeping the streets of that city.

"That's very singular," said a yonng lady to a geutleman who had jnst kissed her. "Oh! well, miss," was the reply, "I will soon make it plural," and the villaiu did.

Mythology tells us that Jo died hecause of her intense love for Jupiter; bnt the charm of the romautic story has lately heen destroyed hy a chemist discovering iodide of potassinm.

The London *Saturday Review* is of opinion that Americans speak "a lauguage resembling the Englisb, and with an emphasis and intouation which resembles nothing ever heard before."

A Good Cause for Divorce.—Mrs. Abby Stone has applied for a divorce from her husband, James Stone, on the gronud of his gettiug drunk, wheu he becomes a "whetstone," which she alleges she does not desire, as she is sharp enongh to do without one.

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Sorizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hausbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Valuable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

New Almaden Vichy Water,

(CALIFORNIA VICHY WATER.)

FROM THE SPRINGS,

NEW ALMADEN,

Santa Clara County.

F. L. A. PIOCHE.....Proprietor.

O. CHAUVIN.....Agent.

OFFICE, 500 JACKSON STREET,

GENERAL DEPOT:

Corner of Jackson and Montgomery streets.

This Mineral Water is especially useful and very powerful, not only in the course of certain diseases, but also as a preventive of intermittent fever, chronic rheumatism, gout, scrofula, general debility arising from disorder of the nervous system and circulation of the blood, and especially of the vellous circulation.

It is necessary to observe, in this connection, that, since the action of this water is very powerful, it must be used in cases of sickness WITH THE ADVICE OF A PHYSICIAN, for there are cases where a patient could not make use of it with impunity, at least in the beginning of a course of treatment(*). On the other hand, the composition of Vichy Water renders it highly efficacious as an adjuvant to the action of certain medicines which, without it, could not be digested, and would therefore remain ineffectual. It is a fact that, for some diseases, the action of this Mineral Water cannot be efficacious without the use of certain medicines which the PHYSICIAN ONLY can properly prescribe. The omission of that precaution is the reason why many patients do not find as much benefit in general all the relief they might otherwise derive from them.

California Vichy Water is used with success in many cases, such as—

Impoverishment of the Blood; Weakness of Nervous System; Chronic Inflammation of Liver, Stomach, Spleen, Spine, Womb, Intestines, Ovaries, and Inflammation generally, *when there is no fever:* Dyspepsia in all its stages; Loss of Appetite; Bad Digestion; Flatulency; Constant and Tenacious Vomiting; Weakness of certain Organs; the Inabilities peculiar to Women; Frequent Uterine Hemorrhage; Hemorrhoides; Obstruction of Liver and Spleen; Night Sweats; Chronic Rheumatism, *when without fever:* Gout, *when the patient is still able to walk;* Gravel, and in case of Diabetes, the New Almaden Vichy Water is a most powerful adjuvant to the remedies prescribed for this terrible disease.

(*) Besides its Medicinal qualities, this Mineral Water is a most agreeable beverage at meals, or at any time of the day, pure or mixed with Water, Beef Broth, Red Wine, White Wine, Champagne, Brandy, Milk, etc.

PRICE—12 Bottles, at the General Depot, $4. Returned Bottles Bought for Five Cents apiece

Twenty-four Half Bottles, $5. Returned Bottles Bought for 50 cents per dozen. 25v18tf

125 J street.....Sacramento.

Corner of D and Second streets.....Marysville.

72 Front street.....Portland, Oregon

Our wholesale House, 628 Commercial street, extending through to 637 Clay street, San Francisco, contains always a most choice, and the largest assortment in this State. Every Steamer brings the latest tissued novelties from Europe and New York, which can be found at all the above stores, at moderate prices 23v16-3m

SAFE AND PROFITABLE. — The French Savings Bank, one of the model institutions of the Pacific coast, netted a profit of 11 per cent. per annum on its business during the six months ending Sept. 30th. Such a profit on the large business of the bank during a period of business depression, shows that the managers understand their business. The deposits have greatly increased of late. The people know that it is safe and profitable to place their money in the French Savings Bank.

THE LATEST FASHION.—An enterprising Yankee has introduced paper petticoats, not to wash. They are all the rage at the "Hub." They cost only 37½ cents each, or about as much as it costs to wash one here. The invention is one of great value to practical young ladies when at the seaside. Owing to their diminutive size, it is impossible to "write a sonnet on a bonnet," but you can write a whole novel on a petticoat. We are in favor of the papers all the time, whether as blankets or petticoats.

THE ENGLISH papers say that the British soldiers are hereafter to wear full beards. We guess there will be a great demand for capillary lotions, as not a few of the young Britishers are as bare of beard as a Chinaman.

SAN FRANCISCO is a fast place. The drive home from the cemetry at Lone Mountain is like a race course, full of fast teams.

Machinery.

VARNEY'S PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Millmen are invited to examine these pans and sellers for themselves, at the office, **229** Fremont street,

The Most Important Invention of the Day.

HALL & LEE'S

New Method of Packing Stationary Joints in Steam Engines,

— AND ALSO IN —

STEAM AND WATER PIPES.

BY THIS METHOD OF PACKING THE JOINTS ARE made perfectly steam-tight inside as well as outside, thereby effectually preventing the steam from cutting into the joints of the steam chest. Consequently, an Engine packed after this method will last twice as long as it will when other Packing is used; and the joints may be opened and closed every day, and they will be steam-tight every time they are closed, and the same Packing will remain good forever. Consequently, owners of mills will make a great saving, both in time and money, by having their engines packed by this method. Patented June 8th, 1869. By permission we refer to A. J. Binney, Supt. Northern California Railroad, and A. D. Starr & Co., Proprietors of the Buckeye Mill, Marysville. State, County and Mill Rights for sale by A. H. HALL & H. T. LEE, Marysville, Cal. 6v19-3m

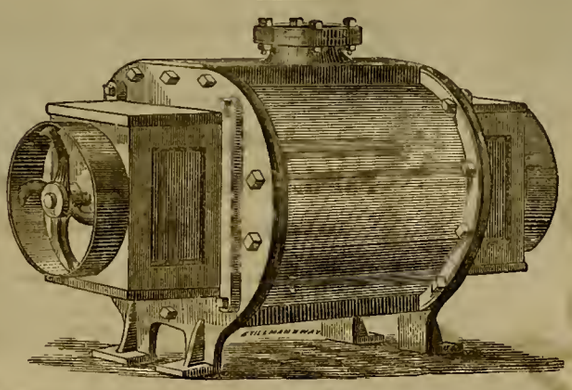
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

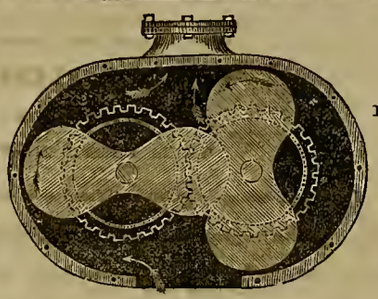
At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition,

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.



ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**



REQUIRES **Fifty Per Cent.** LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Preasure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information, address

Ayer's Cathartic Pills,

For all the purposes of a Laxative Medicine.

Perhaps no one medicine is so universally required by everybody as a cathartic, nor was ever any before so universally adopted into use, in every country and among all classes, as this mild but efficient purgative *Pill*. The obvious reason is, that it is a more reliable and far more effectual remedy than any other. Those who have tried it, know that it cured them; those who have not, know that it cures their neighbors and friends, and all know that what it does once it does always—that it never fails through any fault or neglect of its composition. We have thousands upon thousands of certificates of their remarkable cures of the following complaints, but such cures are known in every neighborhood, and we need not publish them. Adapted to all ages and conditions in all climates; containing neither calomel or any deleterious drug, they may be taken with safety by anybody. Their sugar coating preserves them ever fresh and makes them pleasant to take, while being purely vegetable no harm can arise from their use in any quantity.

They operate by their powerful influence on the internal viscera to purify the blood and stimulate it into healthy action—remove the obstructions of the stomach, bowels, liver, and other organs of the body, restoring their irregular action to health, and by correcting, wherever they exist, such derangements as are the first origin of disease.

Minute directions are given in the wrapper on the box, for the following complaints, which these *Pills* rapidly cure:—

For **Dyspepsia** or **Indigestion, Listlessness, Languor** and **Loss of Appetite**, they should be taken moderately to stimulate the stomach and restore its healthy tone and action.

For **Liver Complaint** and its various symptoms, **Bilious Headache, Sick Headache, Jaundice** or **Green Sickness, Bilious Colic** and **Bilious Fevers**, they should be judiciously taken for each case, to correct the diseased action or remove the obstructions which cause it.

For **Dysentery** or **Diarrhœa**, but one mild dose is generally required.

For **Rheumatism, Gout, Gravel, Palpitation of the Heart, Pain in the Side, Back** and **Loins**, they should be continuously taken, as required, to change the diseased action of the system. With such change those complaints disappear.

For **Dropsy** and **Dropsical Swellings** they should be taken in large and frequent doses to produce the effect of a drastic purge.

For **Suppression** a large dose should be taken as it produces the desired effect by sympathy.

As a *Dinner Pill*, take one or two *Pills* to promote digestion and relieve the stomach.

An occasional dose stimulates the stomach and bowels into healthy action, restores the appetite, and invigorates the system. Hence it is often advantageous where no serious derangement exists. One who feels tolerably well, often finds that a dose of these *Pills* makes him feel decidedly better, from their cleansing and renovating effect on the digestive apparatus.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Mechanics' Institute—Monthly Meeting.

Last evening the usual monthly meeting of the Mechanics' Institute was held at their rooms on Post street. The President, A. S. Hallidie, Esq., occupied the Chair, and congratulated the meeting on the success of the Industrial Fair. He said there stood over from last year a debt on the Pavilion and exhibition of $7,000. In addition to this an expenditure of a further sum of $7,000 had been made in repairing the building and rendering it snitable for the purposes of the Fair this year. The expenses of maintaining the Fair amounted to $350 or $400 per day. Up to yesterday, the total receipts had been $51,000; so that they would be enabled to reduce their debt very materially.

It was not, however, the intention to apply the whole of the net proceeds of the Fair to the redaction of the debt, although a considerable proportion would be so applied. He thought they might well afford to employ a portion in adding to the scientific works in the library, and in other ways rendering their Institute more useful.

The Polytechnic Lecture.

Mr. Hallidie called upon Mr. D. R. Smith, who, according to previous announcement, delivered an interesting lecture upon "Naval Architecture." The speaker, after some preliminary remarks upon what constituted "theory," said that the theory to be presented at that time had reference to ship building. A clipper ship, or an ocean steamer, with its freight aboard, or a little skiff with its single oarsman, was simply "a weight, to move." Heretofore, persons engaged in investigations in this direction, have failed to recognize as a prominent fact this self-evident proposition. They have possibly arrived at the best form for a vessel of a given length, breadth, depth and displacement; but they have failed to discover the fact that in constructing a vessel to carry a certain amonnt of cargo, the weight of the hull depends upon its form. As the form of greatest bnoyancy varies from that of least resistance, it follows that as we abandon the former and increase the latter, we increase the weight of the hull.

In practice, we have fallen too much in love with the beautiful, as displayed in the form of least resistance; and have been too indifferent to the plainer, but more substantial form, set forth in the rude theory. The importance of reducing the weight of the hull has not been sufficiently considered. We regret that want of space will not allow of our giving a full report of Mr. Smith's lecture, for which he received the thanks of the Institute.

San Jose Fruit.—Mr. C. W. Pomeroy, of San José, has regaled this office with two generous sized boxes of choice and rare frnit, including the finest apples we have tasted this season. He has for many years taken great care and pleasure in producing the finest and best cultivated varieties of fruit, and has succeeded to a noticeable degree.

GEORGE T. PRACY'S

MACHINE WORKS,

109 and 111 Mission Street, between Main and Spear,

SAN FRANCISCO.

MANUFACTURER OF

PRACY'S IMPROVED

Patent Steam Engine Governor,

The Simplest and Most Sensitive Governor Built.

This Governor is made of the best material, the shafts being of cast steel and the bearings small, thereby avoiding the use of heavy balls and springs, running at a high velocity and maintaining a uniform speed. All sizes of these Governors are kept constantly on hand, and can be seen in operation at my works.

I also take pleasure in informing the public that during my recent visit to the East I became Sole Agent for

L. W. POND'S CELEBRATED TOOLS,

ACKNOWLEDGED TO BE

THE BEST NOW MADE.

I shall keep constantly on hand all descriptions of

Lathes, Planers, Drills, Boring Mills, Milling Machines,

And every description of MACHINISTS' TOOLS, which I shall offer to the public at manufacturers' rates. Also

Morse's Twist Drills and Chucks of all kinds.

MANUFACTURER OF

ALL KINDS OF STEAM ENGINES AND MILL WORK GENERALLY.

☞ JOBBING PROMPTLY ATTENDED TO. ☜

SOLE AGENT FOR TAFT'S PATENT SHEARS AND PUNCHES.

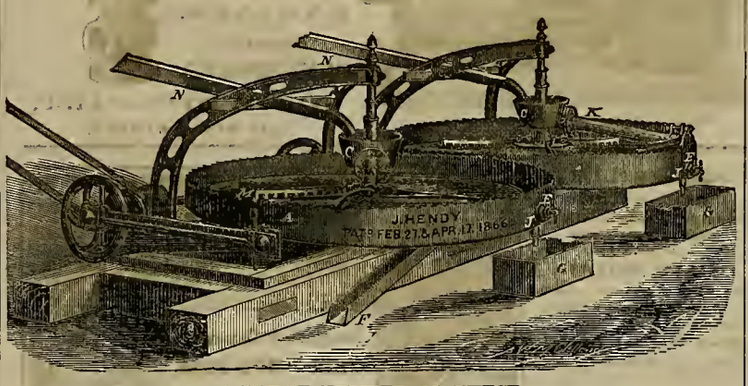
PREMIUM FOR BEST CONCENTRATOR

AWARDED BY THE

MECHANICS' INSTITUTE, 1868,

ALSO AT THE STATE FAIR FOR 1868,

To J. HENDY.



A LARGE NUMBER OF THESE

IMPROVED CONCENTRATORS

ARE IN PRACTICAL USE ON THE PACIFIC COAST.

Mr. Hendy, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice. By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

Office of North Star Mine, Grass Valley, Nov. 12, 1868.

Joshua Hendy, Esq.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.

Respectfully yours, J. H. CROSSMAN, Supt. N. S. Mine.

J. HENDY, Patentee.
Office at Union Iron Works.

Important to Assayers.

Crucibles.

The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.

THE MORGAN PATENT CRUCISLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.

CERTIFICATES:

United States Branch Mint, San Francisco, Cal., March 12, 1869—Messrs A. S. Hallidie & Co, Agents Morgan Crucible—I have carefully tested the Morgan Patent Plumbago Crucibles purchased from you for the U. S. Branch Mint, and cheerfully certify to their superiority and economy over all other Crucibles used by and under me. They are fully what you represent them, and I shall continue to use them in preference to any other. J. M. ECKFELDT,
Melter and Refiner, U. S. B. Mint.

Eagle Brass Foundry, 206 Fremont street, San Francisco 12th March, 1869—Messrs. A. S Hallidie & Co., 519 Front street—Gentlemen:—We have used and tested the Morgan Patent Plumbago Crucible, for which you are agents, and pronounce them superior to and cheaper than any Crucible used by us heretofore. GREENSERG & MOORE.

Messrs. A. S. Hallidie & Co:—We have thoroughly and severely tested in every way the Morgan Patent Plumbago Crucible obtained by us from you, and find them superior to any we have yet tried, although we have used every pot obtainable in this market, we have none equal to the above, and concede superiority for them. We think they will average 45 pourings of brass.
GALLAGHER, WEED & CO.,

California Brass Works, 125 Front street, San Francisco.

Assay Office of H. Harris, Silver City, Nevada, April 24, 1869—Messrs A. S Hallidie & Co.—Gents.:—I received from you three Crucibles of the Morgan make, which I have used since their arrival, and tested by constant use. Since 1847, when in the New Orleans Mint, I have always preferred the Crucible of Dixon's make over Addis, Gaultier, and Taunton, Mass. Yours I find to be not alone of more finished make, but to stand double or treble the work of Dixon's Crucibles. The No. 12—the smallest sent—has stood so far 32 meltings, and is as good and sound as when received. Your Crucibles do not scale off like others; and as they are forty per cent. cheaper, I do not see why they should not be preferred by all assayers on account of durability and cheapness. Yours respectfully, H. HARRIS.

On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,
18v18-9p] 519 Front street, San Francisco

MINING AND SCIENTIFIC PRESS.

BY DEWEY & CO., Patent Solicitors. SAN FRANCISCO, SATURDAY, OCTOBER 16, 1869. VOLUME XIX. Number 16.

Mechanics' Institutes.

Mechanics' Institutes originated in England, a little over 200 years ago, since which time they have been gradually increasing in number until there are now about 250 in the kingdom, embracing a membership of over 30,000—a large portion of whom are the real workingmen of the country. The most of the English associations have a three-fold object—the forming of classes mostly for night instruction; the sustainment of one or more annual courses of lectures on popular and interesting subjects, and the gathering of libraries for the use of members and subscribers. One of the most prominent, if not the very foremost of all of the English institutions, is the one at Liverpool, which numbers about 3,500 members; keeps up three day schools with an average attendance of about 900 pupils, and 600 evening scholars, divided into a suitable number of classes. Fifty teachers are constantly employed, at an aggregate salary of about $30,000. Of course, the institution is liberally endowed.

The first institution of this character established in the United States, if we mistake not, was the Boston Lyceum, established in 1826. Mechanics' Institutes have been of great service to the young men of all places wherever they have been established, and are especially worthy of support and encouragement by all enlightened and liberal minded men. They have been the means of training up hundreds and thousands to lives of usefulness in the industrial arts; and they have done much to propagate habits of industry and of studiousness among the masses. They have been of great service to young men in every way.

The San Francisco Mechanics' Institute has made a most noble beginning, and bids fair to become in a very few years, one of the noblest and most useful in this country. That its efforts at usefulness are fully appreciated, are amply shown by the liberal patronage which has ever been extended towards its occasional public exhibitions, which are its only sources of income beyond the voluntary contributions and dues from its individual members. Its field of usefulness and efforts in that direction will be extended just in proportion as it is supplied by means.

THE performance of the 12th Artillery Band at the Pavilion Monday night, was quite a success; the leader, Mr. Heydenreich, being himself a musician of some originality,—the composer of half the peices that were performed. The detachment of troops to which this band belongs have just made the overland railroad trip, and the Railroad Galop of last night is the result of Mr. Haydenreich's musical ears being for seven days exposed to the clattering and wheezing noises of the overland train.

ALPINE MINER.—This paper is filled with interesting matter relating to mining, and from its columns one is lead to the conclusion that Alpine county is destined one day to loom up favorably, in comparison with other mining regions, where legitimate mining has never had the opportunity to produce its rewards.

WM. H. MURRAY, our traveling Agent, is now on a tour through Yuba, Colusa, Nevada, Placer and El Dorado Counties, and will look after the interests of the PRESS on that route.

The Union Foundry—Locomotive Building.

There is probably no branch of machinery manufacture which imposes greater responsibilities upon the builder, or more severely taxes his mechanical ingenuity, than the construction of railroad locomotives. Strength, durability, speed, perfect proportions and beauty, are demanded at his hands. Upon a single beam, brace, bolt, tie or spring may depend the lives of hundreds. This branch of business, on the Pacific Coast, has thus far been mostly entrusted to Booth & Co., of the Union Iron Works, and it is with pride that the proprietors of that establishment and Californians generally, point to the result of their labors, with the confident assurance that in all the important essentials of good locomotives no establishment in the country has turned out better work.

The accompanying engraving represents the first locomotive turned out by these works—the "California," for the San José Railroad, which made its trial trip on the 30th of August, 1865, drawing a large number of cars, filled with invited guests, and moving, a portion of the distance, at the rate of a mile a minute.

Since that time this establishment has turned out eleven others, or twelve in all—first class locomotives, as follows:

The California, Atlantic and Union, for San José Railroad.

The A. A. Sargent for the Central Pacific, and the Calistoga for the Napa road.

The Mount Diablo, Bostou and Sampson were built for the Pittsburg road, to take coals from the Mt. Diablo coal mines to the Bay shore landing on the San Joaquin.

These locomotives were built to overcome a maximum grade of 276 feet per mile.

The D. O. Mills was built for the Black Diamond coal mine, to overcome the extraordinary grade of 305 feet.

The Lyon, Ormsby and Storey, have been constructed for the Virginia and Truckee roads, with grades of 116 feet, with exceedingly short curves. The last named was shipped from this city, via the San José and Western Pacific roads, on Wednesday last.

All these locomotives have been constructed with everything A No. 1, designed to do good service, and the most of them, as already observed, upon extraordinary high grades and short curves. We are promised, at an early day, some statistics, going to show the superior economical working of these engines.

FIRST FULL-SIZE CALIFORNIA-MADE LOCOMOTIVE—H. J. BOOTH & CO., BUILDERS.

ELEGANT GAS FIXTURES, ETC.—Root & Nye, 421 Kearny street, make a very fine show of gas fixtures, just within the entrance to the music room. They exhibit chandeliers in blue and gold, gold gilt, French and English bronze, Egyptian, Gothic and Flemish styles, chandeliers with center lights arranged to drop; Gothic standards, in brouze and gilt figures, for drop lights; marble ornaments; bronze figures, and gilt, bronze and marble clocks. Messrs. Root & Nye, who have recently opened their store on Kearny street, have been for some years engaged in the manufacture of gas fixtures at the East, and are therefore fully posted in the business. They receive all new styles from the East and Europe as fast as they appear there, and intend to keep as full and complete an assortment of new style patterns as can be found on the Pacific Coast. Their exhibit at the Pavilion, fine as it is, hardly does justice to the large and elegant assortment at their store on Kearny street. They have a particularly fine assortment of mediæval and architectual church fixtures, Ecclesiastic, Masonic and other emblems. Call and see them.

San Francisco Yacht Club.

This flourishing and creditable outgrowth of the wealth of San Francisco, is developing itself into an institution, having now its club house on the Long Bridge, and its half-a-dozen sea-going yachts, whose journeyings around the Pacific world we hope will, ere long, have to be chronicled, and will add to the renown of the commercial metropolis and law-giving mistress of the great ocean. Last Saturday the club house was formally opened with suitable festivities; and on the coming Saturday there will be a regatta. Have we in our midst amougst the wealthier class, genuine adventurers, yachtmen worthy of the name? San Francisco habor is unfavorably situated for the development of yachting tastes; but the north western coasts, the islands of Polynesia and the East India Archipelago, afford the very best yachting ground in all the world for adventurous people of leisure, who will here assume the guise of the inevitable Yankees on the reconnoitering lines of manifest destiny.

SEMI-MONTHLY TROY "POLYTECHNIC." A very well-gotten-up engineering and collegiate journal under the title of *The Polytechnic*, has been started by Montague L. Marks and other graduates, attachés, and friends of the Troy Polytechnic Institute, at a subscription price of $4 per annum. The idea of thus binding the graduates together, and keeping them in communication with that institution, is a good one and worthy of being sustained. But the *Polytechnic* is to be devoted specially to the advancement of polytechnic science and scientific education, a field in which a worthy laborer in this country will be capable of doing incalculable good.

Mechanical Progress.

High Pressure Furnace—Bessemer's Last.

Engineering for September 17th describes and illustrates this latest invention of Henry Bessemer,—and furthermore gives an elaborate editorial on the subject. It is, in brief, a cupola furnace in which very great intensity of heat is obtained by means of combustion of the gaseous products therein under pressure, the outlet for the escape of flame being very small compared with that of the ordinary cupola furnace. The idea suggested itself to Mr. B. while experimenting upon the production of high heat from the solar rays, for the purpose of metallurgical operations. While making preparations to construct a gigantic burning lens, twenty feet in diameter, he was led to consider the cause of the intensity of the solar heat. A calculation entered into by the journal aforesaid, shows that the quantity of heat falling on a square mile of the earth's surface is sufficient to melt 100 tons of cast iron per minute! This is a far more intense heat than can be obtained by the combustion of the same elements in our own atmosphere. It occurred to Mr. Bessemer that as the force of gravity at the sun's surface is 27.6 times as great as at the surface of the earth, all the incandescent solar gases must be maintained in a state 27.6 times as dense as they would be if they formed a portion of our own atmosphere; and he was struck with the idea that the great intensity of the solar heat might be simply due to the fact that the combustion took place—terrestially speaking—under excessive pressure. Mr. Bessemer accordingly designed a small cupola furnace, so made that the products of combustion, instead of escaping freely, were checked, so that the pressure maintained within the furnace was considerably above that of the atmosphere. "With this furnace,"—says *Engineering*,—"Mr. Bessemer has obtained results which bid fair to revolutionize many of our metallurgical processes. So far the furnace has only been worked at pressures of from 15 to 18 lb. per square inch above the atmosphere; but even with these pressures, the temperature obtained is such that steel, and even wrought iron, may be melted even more readily than cast iron in an ordinary cupola. Thus, a piece of 2 in. square bar iron, a foot long, and weighing 13 lb., was introduced cold into the furnace, and was completely fused in five minutes and a half; while 3 cwt. of wrought-iron scrap, also introduced cold into the same furnace, was run off in a complete fluid state in fifteen minutes! Startling as such results are, they become more startling when it is remembered that they are produced in a small model furnace without a much greater expenditure of coke than would take place in an ordinary cupola furnace melting cast iron. For, although Mr. Bessemer uses blast at a pressure of 20 lb. or so per square inch, yet its effective pressure, or that which causes its flow through the tuyeres, is only the difference between this pressure and that within the furnace; and the rate of combustion of the fuel, therefore, is not much greater than it would be in an ordinary furnace using blast at a pressure equal to that difference. * * Theoretically, the system affords a means of producing absolutely any temperature whatever, simply by increasing the pressure under which the combustion is allowed to take place. It is probable that the system will serve more important ends than even steel melting, and that it may lead to alterations in our iron manufacture scarcely dreamed of. Who knows whether we may not one day distill iron as we now distill zinc and other metals of its class?"

New Method of Tinning Copper.—Herr Hiller dissolves 15 parts of salt of tin in 150 of water, and adds a solution of 30 parts of caustic potash in 300 parts of water. The objects to be tinned are put upon a perforated tin funnel, which is then placed in the solution. The whole is heated over a fire while the objects are stirred with a tin rod. In a few minutes they are coated with a layer of tin.

Watt was Right.

From the address before the British Association at Exeter, by the President, C. W. Siemens, F. R. S., we quote the following:

"James Watt was not satisfied to exclude the condensing water from his working cylinder and to surround the same by non-conducting substances, but he placed between the cylinder and the non-conducting envelope a source of heat in the form of a steam-jacket filled with steam at a pressure somewhat superior to that of the working steam. His successors have not only discarded the steam-jacket, and even condemned it on the superficial plea that the jacket presented a larger and hotter surface for loss by radiation than the cylinder, but expansive working was actually rejected by some of them on the ground that no practical advantage could be obtained by it. The modern engine, notwithstanding our perfected means of construction, had, in fact, degenerated in many instances into a virtual steam meter, constructed apparently with a view of emptying the boiler in the shortest possible space of time. It is only during the last twenty years that the subtle action of saturated steam (in condensing upon the sides of the cylinder when under pressure, and of re-evaporating when the pressure is relieved toward the end of each stroke) has been again recognized and insisted upon by Lechatelier and others, who have shown the necessity of a slightly superheated cylinder in order to realize the expansive force of steam. The result has been a reduction in the consumption of fuel in our best marine engines from 6 lb. or 8 lb. to below 3 lb. per gross indicated horse-power."

Chatelier's Steam Brake.—The objections to reversing the gear of a running engine are great. *The Engineer* says: "The hot gases of the chimney are exhausted out of the smoke-box and forced into the boiler, heating the cylinders and shaking the joints of the boiler. The piston rods get heated, the packings carbonize, the slide valves bite on the port faces, the injectors cease to act from the presence of incondensible gases in the steam, and, in some classes of engines, the reversing handle is often dangerously thrown back. Now M. Le Chatelier has proved that all these inconveniences may be remedied by simply leading a small tube from the boiler to the bottom of the exhaust pipe near the cylinders. The 8 to 40 pounds of hot water per minute thus delivered under the boiler's pressure are instantaneously converted into a fine spray by contact with the hot metallic surfaces of the cylinders and pistons. While cooling them, and absorbing the heat produced in the motion of the parts, the steam produced not merely acts as an elastic brake, but it may be made to cause a discharge from the blast pipe sufficient to keep out any gases from the smoke-box. The apparatus may, therefore, be said to consist of a pipe from an inch to an inch and a quarter diameter, and a common tap."

Martin's Patent Piston.—T. H. Martin of Swansea, Eng., read a paper at the late annual meeting of the Miners' Association of Cornwall and Devon, on pistons,—in the course of which he gave an illustrated description of his own, recently patented. We quote one paragraph which will give an idea of its construction:

"This invention consists in the introduction of a valve in the body of the piston, having chambers formed in its interior at each end. Around the sides or walls of these chambers, and communicating with the interior of the piston, are any convenient number of ports or openings. These, as the valve is forced to and fro alternately, communicate with the interior of the piston, allowing the steam to press or tighten the rings against the sides of the cylinder."

Car Starter.—A Buffalo railroad man has invented a new car-starter and brake for street cars. It consists of an ingenious arrangement of friction wheels, by which he throws a spring into gear; and, when the brake is taken off, the spring starts the car ahead, without any effort on the part of the horses.

A New Plane.—The latest plane is an iron one in which the tendency to "stick" to the wood, which has been one of the objections to other planes, is completely obviated by longitudinal grooves on the face.

Scientific Progress.

The Independent Existence of Force.

Prof. Walling, of Lafayette College, read a paper at the Salem meeting of the American Association, of which Prof. Wurtz gives in the *Gas Light Journal* an abstract sanctioned and revised by the author. After alluding to the high estimation in which the doctrine of the conservation of force is justly held, he remarks that serious difficulties are encountered whenever we attempt to state the law clearly, and demonstrate its applicability to facts; owing to a want of precision in the definitions of the terms matter and force, and a failure to recognize the *independent* existence of force. The usual enunciation of the conservation theory is that the aggregate amount of energy in the universe is unchangeable in quantity. Now, as the amount of energy which a moving body possesses, depends upon on its velocity, it follows, if we suppose that all energy is conserved, that there can be no diminution of velocity in any part of the physical universe without a corresponding increase in some other part, and *vice versa*. But a pendulum, if raised and allowed to fall gradually acquires energy, which it gradually loses again as it rises on the opposite side of the lowest point; and it cannot be shown that this energy which appears and disappears is drawn from or imparted to any other material body. So with the heavenly bodies which approach and recede from each other in accordance with the laws of gravitation. So also with the atoms of bodies; which are not in contact, but approach and recede from each other in continually recurring cycles almost inconceivably brief.

Every physical phenomenon indicates that the total energy of the universe, instead of being constant, is essentially variable. It is only because the periods of loss and gain are, in atomic motions, so brief, that their energy *appears* to be constant, for the reason that we can only estimate the *mean* energy, which is *really* constant. The phrase "potential energy" has been introduced to indicate that energy which has disappeared in a cyclical motion, being that which the *position* of the body makes it possible to acquire in the future. Thus, when the pendulum is at its highest point it has no *actual* energy, for its motion is entirely gone. But it is so situated that it has an available space to fall through, in which gravity may again act upon it to impart actual energy. It is therefore said to possess "potential energy;" that is, it has a possible energy in the future.

In the same way, chemical atoms or molecules, for example, those of carbon or hydrogen have a "potential energy," due to their possible union or "falling together" with atoms of oxygen, and when this falling together takes place, the actual energy of combustion is manifested. If *all* the actual energy of combustion could be expended in effecting the separation of the combined atoms, it is evident that the energy which has been developed by the union would be just sufficient to again effect a decomposition of the carbonic acid or water resulting from the combustion, restoring the component atoms to their original condition. Radiation, conduction, etc., of course prevent this, and the combined atoms maintain their union until they are separated by an energy which is superior to that with which they unite.

In general, the maximum potential energy of cyclical motions, like those of the pendulum, the planets, and the revolving or vibrating atoms, is equal to their maximum actual energy; and since whatever is taken from one is added to the other, *the sum of actual and potential energies is a constant quantity*, and this is the way in which the theory of conservation of energy is maintained. All difficulty is removed if we admit the existence of force as a distinct entity in an *independent condition*, as has been recently advocated by such men as Faraday, Waterston, Croll, and Sir John Herschel. The force which becomes associated with matter is then supposed to be drawn from an external, universal store, and restored to it when dissociated.

Action of Plants in Artificial Light.—M. Prilleux has found that solar light is not indispensable to the decomposition of carbonic acid by plants. By operating with care on plants under the influence of the electric, or the magnesium light, he succeeded in obtaining an evolution of oxygen.

California Fossils in Michigan.

We clip the following from the Yale *Courant's* condensed report of the proceedings at the meeting of the Board of Regents of the University of Michigan, Sept. 21st:

"Professor Winchell made a lengthy report on the museum. It appears that two large collections have been added during the year: one of plants and insects was donated by the widow of the late Dr. G. S. Ames, of Niles; the other, purchased for $200 from the executors of David Van Vechten, consists of 1,573 specimens, which embrace some very interesting mammalian remains from Table Mountain, California, among which are teeth and bones of *mastodon;* tooth of an elephant; skull and bones of *Bos (latifrons ?);* bones and teeth of a fossil horse, and fragments of the skull and femur of man."

We make a note of this, in order to keep track of the specimens for the benefit of future students of palæontology in California. We shall do the same whenever we find similar memoranda from any other State. It will thus be made an easy matter for such students, with the aid of the then ancient files of the Mining and Scientific Press, to hunt up and examine what specimens they require for illustration; it being merely necessary to make the tour of the United States for that purpose. The enlightened Legislature of that distant day will doubtless appreciate our foresight.

Böttger on Occlusion of Hydrogen.—"Whilst repeating some of Graham's experiments, under varied conditions, Böttger obtained some interesting results. He employed a battery of two Bunsen cells, strongly excited, and, as electrolyte, water, rendered feebly sour with pure sulphuric acid. The anode was a plate of platinum foil, and the cathode a square inch plate of palladium, of the thickness of stout note paper, removed about two inches from the platinum, and previously covered on both sides with a pretty thick porous coating of electrically-deposited so-called palladium black. After the circuit had been closed about a quarter of an hour, and it appeared that the palladium was saturated, it was taken out of the liquid and dried quickly between folds of blotting paper; in a few moments its temperature rose to at least 200 deg. Cent. If, after withdrawal from the liquid and quickly drying, such a piece of palladium he wrapped up tightly without loss of time in gun cotton, the latter explodes after the lapse of from three to five seconds. Though before its first saturation with hydrogen the plate of palladium could scarcely be bent with the fingers, it was noticed that after it had undergone a heating it was distorted in a remarkable manner."

Jaconsite.—This is a new mineral described by M. Damour before the French Academy. It was found at Jacobsberg, in Sweden, in a bed of crystalline limestone, and associated with needles of white mica and small grains of native copper. It is crystallized in regular octahedrons, which are rarely complete and generally deformed by the pressure occasioned by their being crowded together. It is opaque and of a deep black color, but exceeding brilliant. When reduced to powder it is dark brown; it cuts glass; its density is 4.75, and it is strongly magnetic. It will not melt under the blow-pipe, and when heated in a platinum crucible it does not perceptibly lose weight. When fused with borax it dissolves entirely, and produces a greenish yellow glass. It is insoluble in nitric acid; hydrochloric acid will dissolve it slowly with a slight evolution of chlorine. By analysis, oxide of iron is precipitated, and the remaining liquid contains protoxide of manganese and magnesia.

Death of Professor Graham.—Thomas Graham, the master of the mint, and the discoverer of hydrogenium, is dead. Some of the most important steps in chemical progress are due to Professor Graham. The law of the diffusion of gases, the diffusion of liquids, and dialysis, were discovered by him. He was elected a Fellow of the Royal Society in 1836, and a corresponding member of the Academy of Sciences of the Institute of France in 1848. In 1855 he was created an honorary D. C. L., by Oxford University.

REVIEW OF THE FAIR.

Classification of Articles.

CLASS V.

SEC. 2—MILITARY ENGINEERING, ETC.

[CONTINUED.]

Hallidie's suspension bridge, the light structure between the two galleries, has features of originality and merit, which are well expressed in the following summary from the *Spirit of the Times:*

"Various contrivances have been invented and applied, from time to time, to overcome the flexibility of the cables and roadway of suspension bridges, and to negative or prevent that undulating motion so dangerous to the stability of the structure and so detrimental to the traffic over it.

Dredge's system of suspending bars tangent to the curve proposed to effect this, and many bridges were erected on this plan; but it possessed the fatal fault of too many independent points of suspension, which, in practice, proved to be its weakness.

Roebling has secured considerable rigidity at Niagara by an immense timber truss eighteen feet deep, which a heavy goods train only depresses about four inches, and which would be sufficient for all purposes, if it were not for the expansion and contraction of the cables, which destroys, to a considerable extent, the useful effect of the truss.

One can readily understand the difficulties to be met with in effecting rigidity in a suspended roadway that will hold good under all variations of temperature and consequent recurring elevation and depression of the curve of the bridge cables, or chains, from contraction or expansion, which difficulty, we believe, has never until now been successfully overcome. This is the most important, although not the only feature, in Mr. Hallidie's invention, and is one which he claims to have successfully accomplished. We accord to him the full benefit of his claims, remembering that he has been engaged for many years in the construction of bridges, and that the solving of this knotty problem has had the benefit of his practical experience and observation.

It is by means of these converging rods, in connection with the arrangement of the chains and cables together, with the lateral girders, that the inventor claims to secure a rigid bridge, as perfectly rigid as it is possible to make a suspension bridge, and a bridge in every way adapted for long spans and railroad travel—combining simplicity of construction with economy of material. This bridge has received the highest commendation of European bridge architects, as well as from Roebling himself."

Wire Rope.

Wire ropes constitute the specialty of Mr. Hallidie's establishment. To apprehend the extent of this field in modern times, one must reflect to what extended uses iron wire is brought. Standing rigging for ships, and the running gear of the mines are found to be more economical, because more durable and safe, made of iron wire than of hemp. Even for light flexible wheel and pulley connections, the brass wire twine, or the silver-like alloy exhibited by Mr. Hallidie, are much used, and liked for their durability and perfect adjustability without stretching. Metallic ropes from one inch in diameter to the smallest cords, are to be seen in coils and on reels in this space. They constitute the engineer's substitute for clumsy chains, and might be used a hundred fold more to advantage by people who have not yet learned to know their comparative cheapness and strength. The large ropes are made with convenient eyes at the ends, and may be spliced, in a peculiar manner.

Hemp Rope.

The hemp rope exhibition of Tubbs & Co., is as unpretending and as substantial as that of Mr. Hallidie. A pile of coils about ten feet high shows from the largest up to the smallest size. Hemp rope manufacturing in San Francisco is an extensive and profitable industry, the works at the Potrero being on a par with our largest manufacturing undertakings, in every respect. Chinese labor and immense quantities of the best running machinery, enable the establishment to furnish the Pacific Coast with rope by the ton, at reasonable prices.

SECTION 3.—CIVIL ENGINEERING AND ARCHITECTURE.

Drain and Water Pipes.

Drain and water pipes are on exhibition, representing three establishments—the Asphaltolin Company, Mr. Martin's at North Beach, and Mr. Clark's at Sacramento—whose products all differ. The asphaltolin pipe is a new invention, an original and most excellent idea brought into profitable use. Hemp cloth is wound around the molding stick and tarred with asphaltum. The pipe is exceedingly light and strong, withstands a great internal pressure, is durable against acid and alkaline waters, and last, not least, is cheap. A large job of asphaltolin pipe, laid some time since in Sonoma County, has proved to all who have examined it the superior merits of the article. Martin's pipe is a clay cement, which packs well, and has the appearance of being a very perfect article of its kind. It is shaped into all kinds of curves, having proper joinings, and even into circles, with ease. Clark's pipe is of pottery, and is a well baked stone ware, having overlapping joints of the old fashioned sort.

Brick.

Pressed brick, of fine appearance in the wall, are exhibited by J. P. Clay, but by what process made, or in what respect they are claimed to be superior, does not appear. They are good brick, looking as brilliant in their peculiar red as if they had been oiled—which, however, may have been the case. The Sacramento fire brick of M. Clark & Co. resembles English fire brick, and is made of a mixture of brick clay and steatite, materials abounding round the embouchures of the foothills in Sacramento and Amador counties. Tests, the results of which are exhibited, show that on the score of excellence the imported English is not ahead; so that the supply of the market is only a matter of underselling. Cheap home-made fire brick of a merited good reputation would soon meet with considerable demand, as smelting and roasting establishments are everywhere multiplying.

Earthquake-Proof Building

Should have received a large amount of attention at the present Fair. The Earthquake Committee of the Chamber of Commerce ought to have placed on exhibition some of the models and plans submitted to them, for they belong properly to the mechanics; and in the Mechanics' Institute Fair or library they would only become the mechanics' public property, where some attention would be likely to be paid to them.

Amongst all the earthquake-safety designs that necessity has called forth, not a few of which builders have begun to put in practice, we see represented at the Fair only Mr. Portois' patent earthquake and fire-proof chimney, and the same inventor's earthquake-proof brick. The former consists of a wooden framing, or box shell, of the size, shape and appearance of an ordinary chimney. Inside of this is a common stove-pipe packed with cement—both earthquake and fire-proof. Portois' brick is a common brick molded with two little holes or indentations on each side to receive pins.

Architectural Varieties.
